INTRODUCTION

THE year 1946 is notable for the attempt to establish peace upon earth under the direction of the United Nations and for the apparent effort of scientists to utilize atomic energy, not for the destruction of mankind, but for the extended services of good will and international prosperity. *The Book of the Year*, now in its tenth issue, aims to record, for the most part, the activities of men and women who were hopeful of doing these things during the year 1946.

It records also, as usual, the activities of those who unfortunately did not wish to do these things, or who did not think clearly about them or who did not care.

A review of the articles which pass the Editor's desk year after year makes apparent this conflict of interests. No one short of the mad can wish for anything less than peace, good will and prosperity. Yet we fight in peace as we fight in war—and death and disaster are always threatening.

The trouble must lie in a world-wide spiritual and moral inadequacy. We need to be wiser. We need to be more honest. We need to learn better the techniques of friendliness.

The record of the year would seem to indicate that the people of the world might be beginning to learn the rich advantages of humility, honesty and restraint over simulated optimism, intellectual dishonesty and personal ambition.

Such education is urgent, for if the people of the world will not learn to live in peace together, they will surely altogether perish.

* * * * *

The Book of the Year was made not only by its authoritative contributors, but by the checkers, the stylists, the young women of the working card files; by Miss Elsiebeth McDaniel and her assistant, Miss Martha Harriett Mullen, who marshalled the handling of copy; by Miss Helen Doolittle, who carried on the heavy correspondence necessary to assemble contributions; by the Misses Wilma Widdicombe and Audrey Milgate, who laid the final page arrangements; by Mrs. Mildred B. MacDonald, secretary to the Associate Editor; and by Mrs. Mae H. MacKay, who with her two assistants, Mrs. Harriet Milburn and Miss Lorene Lawson, directed the work of more than 40 staff assistants to speed the articles to the presses.

WALTER YUST

EDITORS AND CONTRIBUTORS

WALTER YUST, EDITOR OF ENCYCLOPÆDIA BRITANNICA
AND OF THE BRITANNICA BOOK OF THE YEAR

HOWARD E. KASCH, *Associate Editor of the Book of the Year*

LIBRARIAN CONSULTANTS

CALENDAR OF EVENTS, 1946

For elections and disasters of 1946, see under those headings in the text. For obituaries of prominent persons who died during 1946, see under the entry Obituaries.

JANUARY

1 Emperor Hirohito in broadcast to Japanese people said notion of his divinity was matter of "legends and myths."

Siamese-British peace treaty was signed in Singapore, ending state of war which existed from Jan. 25, 1942.

Maj. Gen. Walter G. Short said failure of war and navy departments to keep him fully informed of developments was responsible for U.S. unpreparedness during Pearl Harbor attack.

3 Pres. Truman called on U.S. people as "most powerful pressure group in the world," to exert their influence with congress to speed up reconversion program.

William Joyce—also known as "Lord Haw Haw"—who was convicted of treason, was hanged in Wandsworth prison, London.

4 U.S. war department announced it would slow demobilization of overseas troops because occupation armies were dangerously under strength.

Congressional committee investigating Pearl Harbor received report of former Sec'y of Navy Knox which placed blame for Pearl Harbor disaster on army and navy commanders in Hawaii.

5 U.S. and Siam resumed diplomatic relations.

7 Kaiser-Frazer corporation and United Automobile Workers (C.I.O.) negotiated wage agreements under which workers received high wage rate and in return guaranteed 90% production and punishment of wildcat strikers.

Dismembered body of Suzanne Degnan, six-year-old girl who had been kidnapped by unidentified slayer who demanded \$20,000 ransom, was found in vicinity of child's home in Chicago.

Sec'y of State Byrnes assured U.S. that "secrets" of atomic bomb would not be divulged prematurely.

Rumanian cabinet, reorganized in line with Moscow conference declarations, was broadened to include two ministers of opposition parties.

8 Telegraph services in New York city area were paralyzed by strike of 7,000 Western Union workers who walked off jobs when their wage demands were not met.

9 King George VI, in welcoming address to United Nations delegates, urged them to place "service to whole community of nations" above national interests.

General Eisenhower ordered overseas commanders to return to U.S. all troops for whom there was no military need, "without delay" and regardless of points.

10 Paul-Henri Spaak of Belgium was elected president of general assembly as delegates of 51 nations opened first United Nations meeting in London.

Chinese Communists and Nationalists agreed to formal truce ending undeclared civil war as Generalissimo Chiang Kai-shek agreed to restore civil liberties, end police abuses and reform voting procedures.

Radar contact with moon was established by U.S. army signal corps; signal sent to moon from laboratory in Belmar, N.J., echoed back to sending station in 2.4 seconds.

11 General Motors Corp. rejected Pres. Truman's fact-finding board's recommendation of 19½-cent wage increase as based on "unsound" assumption.

Haitian militarists staged coup resulting in ouster of President Elie Lescot.

Albania was proclaimed republic by constituent assembly.

Rear Adm. Earl W. Mills was named by Pres. Truman as chairman of U.S. Maritime commission, succeeding Vice-Adm. Emory S. Land.

12 United Nations general assembly elected Brazil, Poland and Australia to security council for two-year terms and Mexico, Egypt and the Netherlands for one-year terms.

Report that industrial reconversion in U.S. was 90% complete, with 52,000,000 employed and only 2,000,000 unemployed, was made by Committee for Economic Development.

JULY—Continued

22 Chairman May of house military affairs committee refused to appear before senate war investigating committee probing his connection with several munitions firms that allegedly made excessive war profits; May said he was too busy.

Nestor Guillen, head of Bolivia's supreme court, was installed as provisional president after ouster of old regime by student and worker revolutionaries.

Mme. Sun Yat-sen said U.S. and Chinese "reactionaries" were deliberately fanning Chinese civil strife in hope of starting Soviet-U.S. war.

At least 76 persons were killed and 29 others were missing in explosion that wrecked King David hotel in Jerusalem; Jewish terrorists were believed to have been responsible for bomb blast.

James Clement Dunn was named U.S. ambassador to Italy, succeeding Alexander C. Kirk.

23 Irgun Zvai Leumi, anti-British Zionist organization in Tel Aviv, acknowledged responsibility for bombing of King David hotel, but asserted "British tyrants" brought it upon themselves by ignoring phone warnings that hotel was to be bombed.

Bill authorizing U.S. to "stockpile" strategic and critical materials was signed by Pres. Truman, who objected, however, to "Buy American" provisions of measure.

24 U.S. plan for establishment of semi-autonomous world atomic control agency was flatly rejected by Andrei Gromyko, soviet delegate to U.N. Security council, who warned that attempt to undermine veto would be "dangerous and maybe fatal."

25 Revised OPA bill was "reluctantly" signed by Pres.

Truman, who said it failed to assure maintenance of stable prices.

Proclamation re-establishing all rent controls as of June 30 was issued by OPA.

Jesus T. Pinero was named governor of Puerto Rico by Pres. Truman.

Explosion of underwater atomic bomb in second Bikini test sank 10 ships, including battleship "Arkansas" and carrier "Saratoga," and damaged six other craft.

26 OPA resumed functioning after 24-day lapse and issued scores of orders revising price ceilings on many commodities and items.

Senate approved without opposition house-accepted measure to reorganize and streamline congress and sent bill to Pres. Truman for signature.

Soviet union was accused by U.S. of stripping Hungary of vital food supplies and industrial materials in state department note delivered to Foreign Minister Molotov.

U.S. Prosecutor Robert H. Jackson demanded conviction of 22 top nazis on trial at Nuernberg as war criminals, charging they were just as guilty as Hitler because they put "loaded gun in his eager hands."

27 Pres. Truman declared U.S. supported Sec'y Byrnes in his efforts to get "just peace for world," as secretary of state departed for Paris peace parley.

Chinese Communist proposal for unconditional cessation of Chinese civil war was rejected by Nanking government.

"Aggressive and comprehensive" program to develop Alaska's economic potentialities was disclosed by Sec'y of Interior Krug.

House of representatives passed measures giving states clear title to tidelands oil and extending powers of Reconstruction Finance corporation.

Three-man decontrol board which was to have final authority in determining what items and commodities were to stay under OPA price control was named by Pres. Truman; members were Roy L. Thompson (chairman), Daniel W. Bell and George H. Mead.

28 Proposal that France and Britain join in alliance to offset world dominated by U.S.S.R. and U.S. was made by Gen. de Gaulle.

29 H. V. Evatt, Australian delegate, announced at opening of 21-nation peace parley in Paris that he would fight any procedural rules that would limit voice of smaller nations.

Acceptance in principle of U.S. proposal for closer economic ties between U.S. and British zones in Germany was announced by British government.

30 Drafts of Allied peace treaties with Italy, Finland, Rumania, Bulgaria and Hungary were published at Paris peace conference.

Disposal to overseas countries of \$3,612,177,000 worth of war materials for more than \$1,000,000,000 was announced by Thomas B. McCabe, foreign liquidation commissioner.

31 Delegates at Paris peace parley were told by Foreign Minister Molotov that U.S.S.R. opposes any outside interference in economic life of former German satellites.

Pope Pius XII appealed to peace conferees in Paris to make a "just and durable" peace for Italy.

active by-product of atomic bomb plants—to private hospital for use in cancer research.

Retail price of bread in U.S. was increased by one cent on two-lb. loaf by OPA.

After six-hour battle, started by dispute over vote count, U.S. veterans of World War II, equipped with arms, took over town of Athens, Tenn.

British Imperial troops from India were dispatched to Basra, in Iraq, presumably to protect British and Indian oil interests in southern Iran.

3 Drastic economy program was ordered by Pres. Truman, who directed his cabinet to reduce departmental expenditures by \$2,200,000,000.

Eire and Portugal submitted applications for membership to United Nations.

4 Recep Peker was asked to form new Turkish government after resignation of Premier Shukru Saracoglu and his cabinet.

Proposal that church leaders meet to discuss grave east-west tensions was stressed by John Foster Dulles in speech to parley sponsored by World Council of Churches in Cambridge, England.

Iceland formally applied for membership in United Nations.

AUGUST

Big Four's proposal for solution of Trieste issue and Italo-Yugoslav frontiers was flatly rejected by Edward Kardelj, Yugoslav vice-premier.

Soviet union officially branded as "completely groundless" U.S. charge that soviet authorities were stripping Hungary of its economic power.

2 Seventy-ninth congress adjourned after adopting Morse resolution under which U.S. would accept compulsory jurisdiction of Court of International Justice.

Warning that Bikini tests indicated future atomic wars "may well destroy nations and change present standard of civilization" was issued by Pres. Truman's special evaluation commission.

U.S. government sold for \$400 a millicurie of carbon 14—radio-

5 Western powers were sharply criticized by soviet Foreign Minister Molotov, who charged U.S. and Britain sought simple majority vote at Paris peace parley because they controlled enough votes to insure passage of their proposals.

56-day moratorium on new federal construction was ordered by Director John R. Steelman of OWMR in effort to curb inflation.

6 China urged U.N. to postpone consideration of application of Mongolian People's republic for membership for at least a year.

8 Bill appropriating \$2,431,708,000 for G.I. terminal leave pay was signed by Pres. Truman.

XB-36, world's largest land-based bomber, made successful

test flight; new aircraft, powered by six huge engines, has 30-ton bomb-carrying capacity.

9 British foreign office spokesman said Britain was prepared to act without consulting U.N. if British oil interests in Iran were threatened.

Bill giving G.I.s right to collect terminal leave pay was signed by Pres. Truman.

10 Joint statement declaring settlement between Kuomintang and Chinese Communists in China appeared "impossible" was issued by Gen. Marshall and J. Leighton Stuart.

Premier de Gasperi of Italy, found unacceptable Paris peace parley's decisions on Trieste, Italian colonies and navy, and certain economic clauses.

11 Nine white persons were held in custody on charges of "unlawful assembly" after wild race rioting in Athens, Ala.; authorities were compelled to call out state guard to restore order.

Numerous missiles believed to be rocket bombs streaked over Stockholm, Sweden; areas from which they were launched were not known.

12 British government announced halt on all illegal immigration of Jews to Palestine and said would-be immigrants were to be interned in "Cyprus and elsewhere" until their fate was determined.

Formal opposition to admission of Trans-Jordan and Eire as members of United Nations was expressed by soviet union.

Milan police stated body of Benito Mussolini, spirited away by Italian nationalists, was found near Pavia monastery.

13 Measure reorganizing state department's foreign service and boosting pay of high ranking envoys from \$17,500 to \$25,000 annually was signed by Pres. Truman.

France and soviet union opposed admission of Siam to United Nations while soviet union objected to Portugal's plea for admission.

14 Robert M. LaFollette, Jr., was defeated in Wisconsin's Republican primaries for U.S. senate.

OPA authorized increase of from 10 to 13 cents per lb. of coffee.

Plan to admit 1,000 Norwegian "quislings" to Argentina, as part of program to invite emigration of "best racial types," was an-

nounced by Dr. Santiago M. Peralta, Argentine director of migration.

Chiang Kai-shek vowed to end one-party rule in China and set up constitutional government "without delay despite all obstacles."

15 Soviet attacks on U.S. foreign policy were denounced by Sec'y Byrnes, who said U.S. did not have to apologize for its efforts to include "principles of justice, freedom and equality" in peace treaties.

17 Eight volumes of official documents released by U.S. government contained evidence that Hitler contemplated war against U.S. as early as Oct. 1940.

19 Chinese Communist regime ordered all-out mobilization of estimated 130,000,000 people in area under its control to "shatter" offensive launched by Nationalist armies.

At least 3,000 persons were killed and many more were injured in four-day rioting between Hindus and Moslems in Calcutta.

20 Restoration of ceilings on meat, soy beans and cottonseed was ordered by Price Decontrol board.

Lt. Gen. Sir Frederick Morgan, who had been under fire on charges of anti-Semitism, was "released" from his post as U.N.R.R.A. top official in Germany by Director Fiorello H. LaGuardia.

British and U.S. notes sent to Poland complained Warsaw government was repressing democratic activities and charged serious irregularities in counting of ballots in national referendum.

Shooting down by Yugoslav fighter aircraft of U.S. transport plane flying over Yugoslavia was branded "outrageous performance" by Dean Acheson, undersecretary of state; Marshal Josip Broz (Tito) said flight was merely one of many U.S. plane violations of Yugoslav territory, adding Yugoslavia wanted peace, but not "at any price."

21 U.S. state department sent ultimatum to Yugoslav government, giving latter 48 hours to give satisfaction on shooting down of U.S. aircraft over Yugoslavia in which five U.S. fliers were killed, and warning that failure to give prompt satisfaction would lead U.S. to place issue before U.N. Security council.

Yugoslav envoy to Greece was recalled in protest against alleged slanderous attacks on Marshal Tito by Greek press.

U.S. disapproval over soviet note to Turkey requesting that Turks share control of Dardanelles with U.S.S.R. was voiced in state department note that contended U.N. was proper authority to handle question.

22 Marshal Tito's promise to give satisfaction to U.S. over shooting down of U.S. planes was reported by Richard C. Patterson, U.S. ambassador to Belgrade.

Greece was denounced as threat to peace by Dmitry Manuilsky, Ukrainian foreign minister, at Paris peace conference.

23 United Nations received Yugoslav request for return of 167 Danube river boats seized by Allied military authorities; Yugoslavs asserted seizure threatened country's economic life.

Release of Maxim Litvinov as deputy minister of foreign affairs was disclosed by Moscow radio.

Britain announced it would not relinquish \$16,000,000 in Polish gold in its possession until Warsaw government fulfilled assurances that general elections would be "free."

24 U.S. state department said Yugoslavia seemingly had complied with ultimatum demanding satisfaction for shooting down aircraft, but reserved right to take case before U.N.; Marshal Tito charged U.S. airmen were engaged in reconnoitering Yugoslav zone of Venezia Giulia.

Greece was accused by Dmitry Manuilsky, Ukrainian delegate to U.N. security council, of trying to foment war in Balkans with British aid.

Jawaharlal Nehru was named by Viscount Wavell to head India's new "caretaker government."

Turkey rejected soviet request for participation in defense of Dardanelles, declaring that U.N. would be adequate guarantee of strait's security.

Japanese government was ordered by Supreme Allied command to set aside 505 large plants in eight basic industries as potential war reparations.

Sir Shafaat Ahmad Khan, Indian Moslem, was stabbed by two unidentified assailants five hours after he accepted post in Indian cabinet.

26 Attorney general's office ruled that War Assets administration could transfer, legally and without cost, surplus real estate property to states.

27 Vice-Adm. Bernard H. Beiri, chief of U.S. naval forces in Mediterranean, disclosed seven U.S. warships were ordered to stop at Greek ports in September on "courtesy" visit.

U.S. note charging electoral irregularities was criticized by Polish government as infringement of Poland's internal rights.

War department disclosure that premature explosion of defective shells caused deaths of 38 U.S. soldiers was made at sessions of Senate war investigating committee.

29 Sweden, Afghanistan and Iceland were unanimously approved by Security council to become members of U.N., but applications of Albania, Eire, Mongolian People's republic and Portugal were rejected.

U.N. Security council was asked by soviet union to order every country with troops in non-enemy states to report on number of troops and location within two weeks.

British authorities in Palestine disclosed death sentences passed on 18 Zionist members of Sternist organization were commuted.

30 U.S. and Britain were accused by Foreign Minister Molotov of interfering in Greek elections to insure return of monarchy.

Bendix trophy air race was won by Paul Mantz, whose average speed over 2,648-mi. course from California to Cleveland was 435.604 m.p.h.

31 Price controls were removed from all fresh fruits and vegetables—except oranges and bananas—by Sec'y of Agriculture Anderson.

Chinese government purchased for about one-fifth of cost U.S. surplus goods originally valued at \$800,000,000.

OPA barred increase in residential rents on grounds that current income from rentals exceeded figures for 1939-40 era.

20 of 22 nazi defendants on trial at Nuernberg for war crimes protested their innocence in final pleas; Hans Frank publicly confessed blame for atrocities laid to him; Martin Bormann was being tried *in absentia*.

SEPTEMBER

Majority of Greek people voted for return of King George II in plebiscite on restoration of monarchy.

Marshal Tito formally apologized to U.S. for death of five

SEPTEMBER—Continued

U.S. airmen shot down over Yugoslavia.

2 Gen. MacArthur warned in summary of first year of Allied occupation of Japan that country was torn between leftist and rightist ideologies.

3 Truck strike opened in New York, curtailing shipments of food to metropolis.

Selling wave on New York stock exchange resulted in losses averaging from 2 to 17 points in sharpest slump in 15 years.

4 British troops in Greece and rightist Greek government were jointly blamed by Dmitry Manuilsky, Ukrainian foreign minister, for "terrorism" in that country.

Companies headed by Henry M. Garsson were absolved in war department report of charge of having manufactured defective shells that caused casualties among U.S. troops during World War II.

Four-day rioting between Hindus and Moslems in Bombay area resulted in 146 deaths and 557 wounded.

Late revised reports on two Bikini atomic bombings disclosed that only 9 of 92 ships in target area escaped sinking, damage or contamination by radioactivity.

5 Ukrainian charges that Britain and Greek government were responsible for terrorism in Greece were called "unbridled propaganda" by Sir Alexander Cadogan, British representative on U.N. Security council.

Shipping traffic in number of U.S. seaports was tied up by nation-wide strike of A.F. of L. maritime workers.

6 Early establishment of provisional centralized German government was urged by Sec'y of State Byrnes in Stuttgart speech.

7 Report that it would be currently possible to build atomic power plant at operating cost only one-fifth higher than equivalent coal plant was issued by scientific advisers to U.S. delegate on U.N. atomic energy commission.

Third Bikini atomic bomb test was postponed indefinitely by Pres. Truman.

Crews of 3,500 tugboat and harbour craft in New York city joined shipping strike.

8 Bulgarian electorate voted in favour of republic in national referendum.

9 Ukrainian complaint that British and rightist Greek government were fomenting terrorism in Greece was rejected by U.S. and Australian delegates to U.N. Security council.

11 Visits of U.S. warships to Greek port and continued stay of British troops in country were termed "insult to Greek people" by Andrei Gromyko, soviet delegate to U.N. Security council.

12 Sec'y of Commerce Henry A. Wallace warned in speech at Madison Square Garden, New York, that "get-tough" policy with Russia would not prevent war and declared that British policy in near east combined with soviet retaliation would lead U.S. into war unless nation had clearly defined foreign policy; in Washington, Pres. Truman said he had read and approved Wallace's speech.

14 Pres. Truman announced full support of Sec'y Byrnes and said there had been "no change in established foreign policy" of U.S.; president said that in approving Wallace's earlier speech, he had merely approved Wallace's right to deliver it.

15 Federal Security agency revealed that divorces granted in 1945 totalled 502,000 or 25% more than previous year.

Very Rev. John Baptist Janssens, Belgian Jesuit, was unanimously elected general of Society of Jesus in Rome ceremony.

16 U.N. Security council was asked by Andrei Gromyko, soviet delegate, to denounce "aggressive Greek monarchists" and criticize Britain for not having withdrawn troops after elections of March 1946.

Sen. Connally in statement at Paris peace conference insisted that in interests of world peace Trieste be made completely independent of both Italy and Yugoslavia.

Soviet Foreign Minister Molotov rejected Sec'y Byrnes' contention that final German-Polish frontier remained to be fixed, declaring borders were definitely established at Potsdam and were not subject to change.

17 Trucking strike ended in New York city when majority of operators agreed to wage increases and shorter work week.

Sec'y Wallace released private letter he had written to Pres. Truman July 23 in which Wallace urged president to seek an accord with soviet union as means of heading off atomic arms race.

18 Archbishop Aloysius Stepinac, Catholic primate of Yugoslavia, was formally arrested by Yugoslav government and held for trial on charges of "crimes against the people."

Development of powerful poison of which a single ounce could kill every person in U.S. and Canada was announced by U.S. chemical warfare service.

International monetary fund was informed by U.S. that par value of U.S. dollar would remain at \$35 per oz. of gold.

19 Proposal for world trade charter, which embraced new world trade body and common code of international commercial practices, was made public by state department.

20 Pres. Truman removed Henry A. Wallace as secretary of commerce because latter's views conflicted with administration's foreign policy; Sec'y Wallace said "winning the peace is more important than high public office."

U.S. state department disclosed all army and navy personnel would be removed from Iceland within 180 days, but that U.S. civilian personnel would be retained at Keflavik aerodrome to maintain communication with U.S. armed forces in Germany.

Charges that Greek government policy in Balkans threatened world peace and security were dropped by U.N. Security council.

National Maritime union (C.I.O.) called off east coast shipping strike.

21 Strike of west coast maritime unions ended after 17-day walkout.

22 W. Averell Harriman was named secretary of commerce, replacing Henry A. Wallace.

23 U.S. abandoned its claim to full compensation for damages from Rumania at Paris peace parley.

Maritime commission disclosed that 19 corporations operating government-built shipyards made "estimated profits" of \$356,006,612 for investments totalling only \$22,979,275 during war.

24 Soviet request that U.N. members report exact number and location of their armed forces in all but former enemy states was rejected by 7 to 2 vote in security council.

Premier Stalin said he did not believe in real danger of "new

war" and said power of atomic bombs would not determine outcome of future war.

U.S. government was asked by Yugoslav government to close its information service in Belgrade on grounds it was distributing propaganda inciting Yugoslavs to "open treason."

27 Fine of \$175,000 was imposed on New York Great Atlantic & Pacific Tea company, 15 individuals and 9 of its subsidiaries by federal judge in Danville, Ill., who found defendants guilty of conspiring to monopolize large part of nation's food business.

28 Warning that it would be difficult to prevent diversion of atomic energy products to war purposes unless "appropriate safeguards" were taken at each stage of atomic manufacture was made by scientific and technical committee of U.N. atomic energy commission.

King George II returned to Athens to resume role as monarch of Greece.

Turkey was warned by U.S.S.R. that if it organized military measures in Dardanelles area with any power not on Black Sea, soviet union would regard such action as threatening security of other Black sea nations.

29 Gen. de Gaulle in speech at Epinal denounced new French constitution draft as "compromise unworthy of republic," because it made no provisions to make France strong.

30 Sec'y of Navy Forrestal said U.S. naval forces in Mediterranean and eastern Atlantic were there to support U.S. foreign policy.

OCTOBER

1 Twelve nazi defendants convicted of war crimes were sentenced to death on gallows by International Military tribunal at Nuernberg; three received life imprisonment, four were given lighter sentences and three—Franz von Papen, Hjalmar Schacht and Hans Fritzsche—were acquitted.

U.S. navy plane "Truculent Turtle" set record for nonstop long distance flight, completing 11,236-mi. trip from Perth, Australia, to Columbus, O., in 55 hr. 15 min.

2 U.S. war department asked for yearly draft of 726,000 men between ages of 18 and 20 to serve for six months in army training program.

OCTOBER—Continued

3 Sec'y of State Byrnes voiced hope that Premier Stalin's statement that there was no danger of immediate war would end "unwarranted charges" that U.S. was using atomic weapon as threat against soviet union.

4 Pres. Truman reiterated request to Prime Minister Attlee of Britain to open Palestine "at once" to permit "substantial" immigration of displaced Jews.

British Labour government announced formation of new ministry of defense intended to co-ordinate army, navy and air services, with Albert V. Alexander as its head.

23 of 25 Negroes accused of participating in race disorders at Columbia, Tenn., were acquitted by all-white jury in trial at Lawrenceburg, Tenn.

5 Agreement with U.S. permitting Americans to use Keflavik aerodrome was ratified by 32 to 19 vote in Iceland parliament.

6 U.S. Superfortress, "Pacusan Dreamboat," completed 9,500-mile flight from Hawaii to Cairo, Egypt, in 39 hr. 33 min.

7 Justice Robert H. Jackson told Pres. Truman in letter that "large numbers" of Germans whose crimes and guilt were equal to those of convicted nazis still remained unpunished.

8 Bernard M. Baruch, U.S. delegate to U.N. atomic energy commission, said in New York speech that U.S. would not destroy existing atomic bombs until world atomic control plan was operating effectively.

9 Indemnity of \$150,000 for lives of five U.S. pilots killed when their plane was shot down over Yugoslavia was paid to U.S. by Yugoslav government, state department disclosed.

State department reiterated its support of Turkey in Dardanelles controversy in note delivered to soviet foreign office.

10 Draft of Rumanian treaty, which included provisions for free navigation on Danube and equal trade opportunities in Danubian nations, was approved at Paris peace parley.

Pres. Truman flatly declared that Great Britain did not have any atomic bombs, in denial of reports that Britain was stockpiling atomic weapons.

Kuomintang's standing committee extended Chiang Kai-shek's tenure as president for another three years.

11 Capture of Communist base of Kalgan in North China by Chinese Nationalist armies was announced by Chinese government source.

Draft of Bulgarian peace treaty was approved by conferees at Paris peace parley.

Yugoslav court in Zagreb sentenced Archbishop Stepinac to 16 years in prison on charges of having actively collaborated with axis powers during war.

12 Announcement that U.S. would pay Italy \$50,000,000 for lire furnished to U.S. army for purchasing supplies in Italy was made by Sec'y of State Byrnes.

13 Draft of new constitution was approved by French electorate by majority of about 1,000,000 votes.

Draft of Hungarian peace treaty was approved by conferees at Paris peace parley.

14 Adoption of draft of Finnish peace treaty terminated work of Paris peace parley; Vyacheslav Molotov, soviet foreign minister, termed as "unsatisfactory" some of results of conference.

All price controls on livestock and meat were removed, effective Oct. 15, by Pres. Truman who blamed meat shortage on "reckless group of selfish men" whom he charged with having encouraged (for political ends) meat sellers to gamble on end of price control.

15 Paris peace conference closed after 11 weeks and 2 days of sessions in Luxembourg palace.

St. Louis Cardinals defeated Boston Red Sox 4-3, in seventh and deciding game of baseball's annual world series.

16 Ten leading nazis, who had been convicted of crimes against humanity by International War Crimes tribunal,

were hanged in prison gymnasium at Nuernberg; Hermann Goering committed suicide by swallowing poison less than two hours before he was slated to hang.

U.S. state department stopped remaining \$40,000,000 of \$50,000,000 credit granted Czechoslovakia for purchasing surplus army equipment and asked Export-Import bank to stop negotiations for another \$50,000,000 credit, charging Czechoslovakia had resold some material to Rumania at profit.

Chiang Kai-shek issued eight-point peace bid to Chinese Communists, declaring he would promptly give cease-fire order if Communists accepted his procedure for resuming peace parleys.

17 King Ibn Sa'ud of Saudi Arabia wrote Pres. Truman that his request to open Palestine immediately to Jewish immigration violated "previous promises" made to Arabs.

18 State department charged that Yugoslav government held individuals in forced labour and urged prompt "remedial" measures.

20 Yugoslav government branded U.S. charge that Yugoslavs were holding many individuals in "slave labour" as "untrue, invented and malicious statement."

Moscow radio attacked U.S. congress as tool of "reactionary" interests and expressed hope that voters at Nov. 5 elections would elect "progressive" candidates.

21 1,400 pilots and copilots of Transcontinental and Western Air, Inc., staged first strike in air line history.

John L. Lewis accused government of violating contract with soft coal miners and demanded reopening of contract for new negotiations on wages.

Social Democratic party emerged as strongest political party in Berlin's municipal elections receiving about 49% of votes cast; Christian Democratic Union was second and Socialist Unity party, sponsored by Russians, was third.

U.S. request that Big Three take measures to guarantee free elections in Bulgaria was re-

jected by soviet union, state department disclosed.

22 Argentine action in halting nearly all food exports to Bolivia was linked with Peron government's displeasure with ouster of Villarroel dictatorship and establishment of democratic regime by Bolivia.

23 Pres. Truman, opening first session of U.N. general assembly in New York, said elimination of fear of war is world's principal need, warning that world disaster would follow if U.N. should be split into "irreconcilable parts" by conflicting ideologies.

All foods and beverages, except sugar, rice, molasses and sirups, were removed from price controls by OPA.

24 U.N. general assembly was told by Secretary General Trygve Lie that Franco regime in Spain would be constant source of mistrust among U.N. members so long as it remained in power.

25 Pres. Truman proclaimed existence of emergency in order to lift duties on imports of lumber and lumber products needed for Federal Emergency Housing program.

27 Government sponsored Fatherland Front bloc won overwhelming majority in Bulgarian national elections; party gained 364 seats to 101 for opposition.

28 Premier Stalin, in interview with U.S. correspondent, said soviet union did not have secret of atomic bomb.

U.S. and Britain were accused by Kuzma Kisselev, White Russian delegate to U.N., of violating U.N. charter by maintaining armies in nonenemy countries.

Rumania was accused by U.S. state department of using methods that would prevent free and fair elections scheduled for Nov. 19.

6 U.S. proposal under which strategic Pacific islands would be placed under U.N. trusteeship provided U.S. remained sole administering authority was disclosed by Pres. Truman.

7 John Foster Dulles, U.S. delegate, notified U.N. that if it failed to accept U.S. trusteeship proposals for control of Pacific islands, U.S. would continue de facto control of strategic areas.

Sen. Robert A. Taft predicted possibility of reducing federal budget to \$25,000,000,000 level within two years.

8 Declaration that U.S., regardless of political party in power, would continue to support U.N. as instrument to keep world peace, was given U.N. by Sen. Vandenberg (Rep.).

U.S. mission to Albania was withdrawn on charges that Premier Enver Hoxha's regime was unwilling to recognize validity of existing treaties.

9 Pres. Truman announced government was ending all controls on prices, wages and salaries, but saving curbs on rent and sugar.

10 French Communist party won greatest number of seats in elections for the first national assembly under new constitution; Popular Republican Movement was second and Socialist party third.

11 Pres. Truman acknowledged that Republican control of legislative branch of government and Democratic control of executive would result in inevitable division but said difficulties could be avoided if nation's interest was put ahead of party politics.

New compromise attitudes in council of foreign ministers were reflected in Sec'y Byrnes's announcement that U.S. ordered return of Danubian ships and barges to owner states and Foreign Minister Molotov's disclosure that U.S.S.R. had restored identifiable property within soviet zones to foreign owners.

12 Disclosure that Rear Adm. Richard E. Byrd would head U.S. expedition to Antarctica involving 4,000 men and dozen vessels was made in Washington.

Reorganization of naval operating forces with establishment

of "task fleets" in both Atlantic and Pacific was announced by U.S. navy department.

13 Field Marshal Smuts warned that if U.N. failed to approve Union of South Africa's proposal to annex South-West Africa mandate, South Africa would continue to administer mandate anyway.

14 Premier Enver Hoxha of Albania charged U.S. used issue of treaty validity to obstruct resumption of U.S.-Albanian relations.

Nobel Peace prize for 1946 was won by Dr. John R. Mott and Prof. Emily Greene Balch of U.S.; chemistry award went to Professors James Batcheller Sumner, Wendell M. Stanley and John Howard Northrop of U.S.; physics award to Prof. Percy Williams Bridgman of U.S.; the literature prize was awarded Herman Hesse, Swiss novelist.

15 John L. Lewis, president of U.M.W.A., formally notified government that union's coal pact with federal government would be terminated Nov. 20; Sec'y of Interior Krug declared U.M.W.A. did not have authority to end agreement by unilateral action.

Draft plan for recognition of de facto authority of Indonesian republic over islands of Java, Sumatra and Madura and establishment within two years of United States of Indonesia under co-equal Netherlands-Indonesian union was initialled in Batavia by Netherlands and Indonesian delegations.

16 Full-dress inquiry into Bilbo's fitness to hold seat in senate was voted by senate campaign investigating committee.

18 U.S. government obtained restraining order to prevent John L. Lewis and United Mine Workers from starting strike in alleged violation of government contract.

19 Radio broadcasting by foreign correspondents was formally abolished by soviet government.

20 John L. Lewis and U.M.W.A. defied federal injunction restraining them from cancelling government contract as coal miners began scheduled strike.

21 Federal judge in Washington, D.C., ordered John L. Lewis and U.M.W.A. to appear before court to show cause why they should not be held in contempt for ignoring government injunction against coal strike.

Britain's readiness to accept soviet proposal for census of all armed forces outside its own border, provided it was linked to general disarmament plan, was announced before U.N. by Foreign Sec'y Bevin.

24 French Communists won largest number of votes in national balloting for selection of electoral college for Council of the Republic.

12 U.S. army personnel and civilians, who were stranded by plane crash on Gauli glacier in Switzerland, were rescued by two Swiss pilots in ski-equipped planes.

26 Request that information on manufacture of atomic weapons be included in any future disarmament conference was submitted to U.N. by Foreign Minister Molotov.

27 Council of Foreign Ministers reached agreement on status of Trieste.

Resolution that would require all 54 U.N. member states to submit reports on total of armed forces, both at home and abroad, by Jan. 1, 1947, was adopted by U.N. political and security committee; soviet proposal to include information on armaments, including atomic bombs and rocket weapons, was defeated.

28 Principle of world inspection and control as means of checking compliance with proposed plan for general disarmament was accepted by Foreign Minister Molotov.

Subcommittee of U.N. general assembly upheld by 10 to 5 vote right of administering states to establish military bases in territory held under trusteeships with approval of Security council.

29 Andrei Y. Vishinsky, deputy foreign minister, told political and security committee of U.N. general assembly that U.S.S.R. did not intend to renounce principle of "unanimity" of great powers; he also insisted that general disarmament start with world ban on manufacture of atomic bombs which he described as "sword of Damocles"

NOVEMBER—Continued

suspended over our heads by single thread."

30 Col. Gen. Eberhard von Mackensen and Lt. Gen. Kurt Maelzer were found guilty and sentenced to death by British military court in Rome for having caused death in March 1944 of 336 Italian civilian hostages in Ardeatine caves.

DECEMBER

Miguel Alemán Valdes was inaugurated as president of Mexico.

Hitherto suppressed report of senate war investigating committee on conditions in U.S. zone of Germany was published; it charged U.S. forces in reich with widespread misconduct, alarmingly high venereal disease rate and flagrant miscegenation.

2 Anglo-U.S. pact for economic merger of respective zones in reich was signed by Sec'y of State Byrnes and Foreign Minister Bevin.

Lea act was ruled unconstitutional by Walter J. La Buy, federal judge in Chicago, who dismissed criminal charges under its provisions against Pres. James C. Petrillo of American Federation of Musicians (A.F. of L.).

United Nations was urged in U.S. proposal to call on Spanish people to overthrow their "Franco Fascist government" if it refused to quit voluntarily.

3 Oliver Max Gardner, undersecretary of treasury, was named U.S. ambassador to Great Britain.

4 John L. Lewis was personally fined \$10,000 and United Mine Workers of America \$3,500,000 for contempt of court by Judge T. Alan Goldsborough of federal court in District of Columbia; criminal contempt proceedings against Lewis were dropped at government's request; Goldsborough said strike was "monstrous" and "threat to democratic government"; counsel for Lewis said verdict was part of government's "political program" to break union by draining its treasury.

Foreign Minister Molotov speaking before U.N. political and security committee clarified veto issue on arms inspection proposal, declaring U.S.S.R. did not intend that security council should have veto over actual control activities.

6 Indian conference in London ended in failure over Pakistan issue; British Labour government clearly indicated it would not accept any constitu-

tion for India that was not drafted with help of Moslems.

Interstate Commerce commission authorized increases in rail and water carrier freight rates and charges averaging 17.6%.

U.N. Security council was informed by Hussein Ala, Iranian ambassador to U.S., that Iran had decided to send troops into Azerbaijan province despite "friendly" soviet advice that this might result in disturbances in area close to soviet border.

7 John L. Lewis called off coal strike, ordering miners to continue working until April 1, 1947.

8 U.N. general assembly, overriding British and U.S. objections, adopted by 32 to 15 vote resolution supporting India's charges that South Africa practised racial discrimination against Indian nationals living there.

9 U.S. supreme court granted justice department's petition to decide appeal in case of John L. Lewis and U.M.W.A. convicted on contempt charges.

Council of foreign ministers agreed to hold next session in Moscow beginning March 10, 1947, to draft peace settlements for Germany and Austria.

Legal committee of U.N. general assembly ruled that crime of genocide is violation of international law for which even "private individuals" could be punished.

10 Immediate establishment of inspection body exempt from veto to check on both armaments and armed forces was proposed by Britain in U.N. general assembly.

12 U.N. general assembly approved by 34 to 6 vote resolution requesting member states to withdraw diplomatic missions from Spain and bar Franco from future participation in U.N.

Léon Blum was named premier of France, receiving 575 out of 590 votes in national assembly.

13 Sec'y of State Byrnes disclosed that U.S. had 550,000 troops abroad, declaring most of them were in Germany, Japan, Korea, Austria and Venezia Giulia.

Charge that Manchurian industries had suffered "appalling" damage during soviet occupation was made by Edwin W. Pauley, U.S. reparations representative, in report to Pres. Truman.

Agreement on Austrian denazification law, food distribution and purge of universities

was reached by Allied council in Vienna.

14 Pres. Truman removed numerous restrictions on housing and relaxed other building curbs in announcing "vigorous" federal housing program for 1947.

Trusteeship council was completed by U.N. general assembly.

U.N. general assembly voted 46 to 7 to accept Rockefeller offer of site in New York city as permanent headquarters.

Ernest Bevin, British foreign secretary, on departure for England after close of sessions of council of foreign ministers in New York, said Big Four had "cleared away good deal of debris of misunderstanding and conflict"; Vyacheslav Molotov, soviet foreign minister, agreed results satisfied soviet delegates.

World disarmament resolution was voted by U.N. general assembly, but soviet request for troop census was deleted from bill; assembly rejected South African request to annex South-West Africa mandate.

15 Siam became 55th member of U.N., receiving unanimous vote in U.N. general assembly.

16 French cabinet composed solely of Socialists was formed by Léon Blum.

17 Declaration that he was "not a candidate" for president was made by Sen. Vandenberg; Harold Stassen formally announced his candidacy for G.O.P. presidential nomination, declaring his immediate aim would be to move "our Republican party along path of true liberalism."

19 Board of inquiry scheduled to go to Balkans and probe causes of border troubles was established by U.N. Security council.

20 Severe fighting broke out between French forces and troops of Viet Nam republic at outskirts of Hanoi.

Prime Minister Attlee told house of commons that Britain would offer Burma independence on same terms as India; Churchill attacked proposal, declaring it signified another step in "decline and fall of British empire."

21 Announcement that Sir Victor Mallet, British ambassador, had been instructed to leave Madrid "at earliest possible moment" was made by British foreign office.

Polish government advised Britain it would not engage in "further debates" about forthcoming elections and accused

Britain of failing to live up to Yalta and Potsdam declarations "in deed or spirit."

22 Barter agreement for first quarter of 1947 between British and soviet occupation zones of reich was announced by military occupation authorities of two governments.

23 French move in setting up customs barrier between Saar and rest of Germany was denounced by Gen. Clay as unilateral action taken without prior consultation of Allied control council.

24 Establishment by Pres. Truman of informal advisory board on labour problems was disclosed in Washington; group included Secretaries Schwelienbach, Clark and Harman; John R. Steelman, reconversion director, Paul M. Herzog, NLRB chairman, and Clark Clifford, special counsel to president.

More than 800,000 Germans in lower income brackets who were subject to denazification trials were amnestied by Gen. Joseph T. McNarney.

25 Permanent constitution was voted by Chinese National assembly in Nanking; Chinese Communists who boycotted assembly said they would not recognize new charter.

27 Announcement that Polish assets and gold frozen in U.S. would be released was made by state department.

Congress was told by Pres. Truman that 70% of U.S. lend-lease aid to wartime allies was considered repaid.

28 Demand that U.N. Security council appoint 11-nation commission to draft world arms reduction plan within at least three months was made by Andrei Gromyko, soviet delegate.

Gen. de Gaulle announced he would not be candidate for presidency of new French Fourth republic because of dissatisfaction with new constitution which he said deprived president of real power.

30 Plan for world control of atomic energy conforming with original Baruch proposals was adopted by 10 to 0 vote in U.N. atomic energy commission; soviet union and Poland abstained from voting.

31 Pres. Truman ended state of hostilities in World War II, but emphasized that state of war and states of emergency proclaimed by Pres. Roosevelt in 1939 and 1941 were still in force; Truman's proclamation terminated 18 wartime statutes.

BOOK OF THE YEAR

Abrasives. The salient production data on abrasives in the U.S. are presented in the accompanying table, supplemented by brief notes on general conditions with respect to individual commodities.

United States Production of Abrasives
(In short tons, or as indicated)

	1942	1943	1944	1945
Aluminous Abrasives				
Corundum*	4,739	5,686	6,402	6,244
Emery	5,277	6,666	6,940	7,856
Carbon Abrasives				
Industrial diamonds, carats*	11,207,103	12,175,430	12,656,835	10,793,285
Silica Abrasives				
Quartz	65,878	99,445	82,379	57,764
Sand (abrasive)	806,878	837,662	897,983	642,511
Sand and sandstone (ground).	527,886	541,350	558,606	533,656
Tripoli	17,536	14,912	18,425	18,247
Silica Stone Abrasives				
Grindstones	12,763	10,732	9,373	10,033
Millstones (value).	\$10,391	\$9,240	\$9,700	\$15,018
Pulpstones	1,918	1,891	?	?
Tube mill liners	2,576	2,585	2,063	1,982
Grinding pebbles	15,487	9,924	8,012	8,615
Silicate Abrasives				
Garnet	4,357	5,935	?	6,306
Pumice	126,522	85,150	88,757	157,011
Artificial Abrasives				
Silicon carbide†	61,681	69,706	56,291	53,733
Aluminum oxide†	183,633	217,425	185,573	147,016
Metallic abrasives†	106,442	124,954	144,550	146,771

*Imports; no domestic production. †Includes Canada also.

Corundum.—Wartime attempts failed to develop a domestic output in the U.S. and imports, mainly from South Africa, continued in 1946 to supply the demand. Import figures for the war years are shown above.

Diamonds, Industrial.—Figures include bort, carbonado, bal-las and dust; see under DIAMONDS for further discussion.

Diatomite.—While diatomite is extensively used as an abra-sive it has so many other uses that the subject is covered sep-arately, under its own name.

Emery.—Production in the Peekskill, N.Y., area continued to increase, to the highest figure after 1918.

Garnet.—Output was the highest from 1925.

Silica Abrasives.—All types of silica abrasives showed de-

clines, from 1% for tripoli to 30% for quartz.

Stone Abrasives.—Output of tube mill liners decreased, but grindstones, millstones and grinding pebbles all increased mod-erately, and pumice rose 75%.

Artificial Abrasives.—Metallic abrasives increased moderately, but silicon carbide and aluminum oxide abrasives declined 5% and 21% respectively.

Foreign Trade.—Total value of import of abrasives declined from \$23,533,638 in 1944 to \$13,493,381 in 1945. Exports of domestic abrasive materials were valued at \$2,087,598 in 1945, as compared with \$2,091,675 in 1944 and \$6,684,352 in 1942.

Canada.—There is only a minor output of abrasives in Canada outside of the forms of silica, chiefly quartz and sand. Ontario reported 1,330 short tons of corundum in 1945, com-pared with 173 tons in 1944, and New Brunswick reported 158 tons of grindstones, compared with 225 tons in 1944. Quartz declined from 1,740,262 tons in 1944 to 1,458,847 tons in 1945. (G. A. Ro.)

Academy of Political and Social Science, American: see SOCIETIES AND ASSOCIATIONS.

Accident Insurance: see INSURANCE.

Accidents. Accidental deaths in the United States during the first 9 months of 1946 totalled 73,400, a 5% increase over 1945.

The 9-month motor vehicle death total was 24,400 or 5,950 more than in 1945.

Occupational accidental deaths through September totalled 12,300, an increase of 200 from 1945.

Public nonmotor vehicle accidents accounted for 1,100 deaths during the first 9 months of 1946, which was only 100 less than

INADEQUACY OF RAILROAD SAFETY SYSTEMS in 1946 was the theme of "Tickets, Please!" cartoon by Daniel Bishop of the *St. Louis Star-Times*

1945's 9-month total.

Home accidents were responsible for 24,600 deaths during the 9-month period, about 500 more than the 1945 figure.

Safety work throughout the nation continued to expand during 1946. Activities of the National Safety council and its affiliated state and community organizations were intensified, along with the accident prevention efforts of industry, schools and governments, and private agencies of many kinds.

A National Safety congress, omitted in 1945 because of travel restrictions, was held in 1946. The 10,000 delegates attending represented every phase of safety in every part of the country.

A Highway Safety conference was called by Pres. Truman in May 1946. About 2,000 safety leaders approved a comprehensive program calling for vigorous and concerted action in every state and city, with national co-ordination through three committees. (See also DEATH STATISTICS; INDUSTRIAL HEALTH.)

(R. L. Fo.)

Traffic Accidents.—The epoch-making Action Program developed by the president's Highway Safety conference held at Washington, D.C., in May 1946 and a sudden drop in the motor vehicle fatality rate to the lowest point on record established a double claim for 1946 as an outstanding year in traffic safety.

On the whole, however, the accident outlook was none too heartening. Millions of overage vehicles, in poor mechanical condition, helped to pile up a huge mileage approaching the all-time peak of 1941. The traffic situation was further endangered by war-neglected roads and inadequate control forces. As in the case of highway construction, the installation and maintenance of signs, signals and highway markings were seriously handicapped by lack of materials, equipment and personnel.

January and Feb. 1946 each recorded 52% more fatalities than the corresponding months of the previous year. The March total was 46% above that of March 1945 and those of April and May both 39% higher than their comparable months.

In June the death toll was 22% above its corresponding month; July, 23%; August, 17%; and September, 4%. October, with 5% less deaths than Oct. 1945, was the first month to show a favourable change in relation to the previous year.

The year's traffic toll was 33,500 deaths and 1,150,000 injuries, with a property damage bill of \$750,000,000. The 1945 death toll was 28,076.

From the standpoint of fatality rate, which takes into account the amount of travel on the highways, 1946 presented a brighter aspect. In 1943, for example, the rate per 100,000,000 mi. was 11.1. In Jan. 1946 it stood at 12.6. By May the figure had dropped to 8 and in July it declined to 7.8, the lowest point in history.

While no single factor can be given exclusive credit for this improvement, the president's conference and the unprecedented activity which it set in motion doubtless exerted a tremendous influence.

The conference Action Program provided the U.S. with a master plan, based on sound educational, enforcement and engineering techniques, by which states and communities could achieve maximum safety and efficiency in highway transportation. Following up on the conference, 28 governors scheduled state conferences to develop ways and means of putting the Action Program recommendations into effect, and more meetings were to be held in other states.

Assisting and stimulating states and local communities to fulfil the highway safety objectives endorsed by the conference was the principal aim of the National Committee for Traffic Safety, which formerly functioned as a clearing house and co-ordinating agency for 48 national organizations, and which was being expanded in 1946 to include all nonofficial groups interested in safety.

The public education programs of the National Safety council and other groups figured prominently in 1946 safety progress. Grand award winners of the Council's National Traffic Safety contest for 1945 were Iowa in the state section and Wichita, Kan., which placed first among cities with 100,000 to 250,000 population. Other cities winning in their respective population groups were Buffalo, N.Y. (500,000 and more); Oakland, Calif. (250,000-500,000); Evanston, Ill. (50,000-100,000); Lynchburg, Va. (25,000-50,000), and Stillwater, Okla. (10,000-25,000).

Entries in the National Pedestrian Protection contest sponsored by the American Automobile association represented all 48 states and 1,246 cities. Detroit, which placed first among cities of 500,000 or more, won the annual grand award. First-place interstate winner was Kansas. Other first-place winners among cities were Wichita (100,000-500,000); Berkeley, Calif. (50,000-100,000); Wauwatosa, Wis. (25,000-50,000); University Park, Tex. (10,000-25,000), and Little Falls, Minn. (fewer than 10,000).

The leading project of the National Commission on Safety of the National Education association was the completion of a guide to aid school boards, school administrators and teachers to develop high school driving programs. By the end of 1946 approximately 7,000 of the nation's 25,000 high schools had instituted courses in driver training.

To the American Legion went the annual trophy for producing the best traffic safety film of the year, *Teach Them to Drive*. The award is given by the National Committee on Films for Safety.

Northwestern University Traffic institute finished its tenth year of training city and state police in specialized traffic control. Regional traffic training, discontinued during World War II, was re-established. An extension division was started to provide post-graduate service to institute alumni.

The Traffic Division of the International Association of Chiefs of Police completed training of personnel and installation of approved techniques at Oakland, Calif., Jamestown, N.Y., and Montgomery county, Md. Follow-up work was carried on in a score of cities, including Detroit, San Francisco, Stockton,

Indianapolis, Louisville and Cincinnati. Police officers also received instruction at the National Police academy of the Federal Bureau of Investigation.

Thirty colleges and universities throughout the nation held training courses for motor vehicle fleet supervisors, sponsored by the Institute of Public Safety of the Pennsylvania State college. After the national program was expanded in 1945, nearly 700 fleet supervisors had been trained.

The American Association of Motor Vehicle Administrators conducted examiner training schools in several states. The A.A.M.V.A. also carried on a broad survey to define the legislative action necessary to establish interstate reciprocity.

To help states and cities in achieving greater uniformity of traffic laws and ordinances, the Automotive Safety foundation created a Uniform Laws division. On the request of public officials, it provides services in the study of local statutes and ordinances to determine their conformity with recommended uniform codes.

Increasing importance attached to the co-operative work of the American Bar association and the National Safety council designed to raise the level of traffic court administration. State traffic court committees had been organized in 28 states, and state and district court conferences held in 42 states.

Meanwhile, because of shortages and prohibitive prices, the states were forced to drastic reorientation of their road-building programs. Many were limiting projects to urgently needed replacement. Consequently, the schedule of construction contemplated in the Federal Aid Highway act of 1944 was far behind. Accomplishment during the 1946 construction season was only about 40% of expectations, both from the viewpoint of contracts awarded and work put in place.

Under the act, with federal and state funds provided on a 50-50 basis, a potential \$2,000,000,000 program was fixed for the fiscal years 1945 and 1946. To the end of 1946, however, a total of only \$1,146,584,000 had been programmed or authorized. Actually under way at year's end were projects amounting

to a scant \$332,000,000, representing 8,522 mi. of construction.

Faced with increased traffic on inadequate arteries, many cities launched stringent measures to alleviate the acute parking problem. The American Retail federation prepared and widely distributed *Keep Customers Coming*, a pamphlet setting forth remedial steps successfully taken in a number of representative cities. The American Automobile association published a new parking manual.

Origin and destination studies being carried on by state highway departments in co-operation with cities were completed in 57 metropolitan areas. These were resulting in 1946 in publication of comprehensive reports, on which would be based not only the planning and design of modern express highways, but measures to improve the day-to-day efficiency of existing streets and roads.

On the press at the end of the year was a report by Yale university's Bureau of Highway Traffic based on traffic behaviour at urban intersections, which was expected to afford better understanding of traffic planning, design and control methods. In 1946 the bureau gave short in-service courses to 700 public officials in fundamental principles for correcting traffic deficiencies. Regular sessions in traffic engineering for graduate engineers were also held.

High among noteworthy achievements was the engineering report prepared for the Collier Committee of the California Legislature and the International Association of Chiefs of Police Traffic division study of the traffic law enforcement legislative and administrative needs for the senate Interim committee on governmental reorganization. (F. M. K.)

Great Britain.—The number of road accidents in Great Britain continued to rise in 1946, although fatalities showed a decrease against 1945. The increase in accidents was due in part to the greatly increased number of vehicles using the roads after the cessation of hostilities. For the first nine months of 1946 the total number of persons killed and injured was 117,588, including killed 3,599, injured 113,989; the corresponding figures for 1945 were: killed 3,708, injured 94,022. The number of deaths for August (always a peak month) was 446, as against 488 for Aug. 1945, and 618 for Aug. 1939. Children continued to form a considerable proportion of the victims, child pedestrians killed numbering 636 and child cyclists 139 during the first 9 months of the year. The greatest percentage of deaths came from accidents in which private cars were involved. The ministry of transport, in conjunction with the Royal Society for the Prevention of Accidents and accident committees set up under local authorities, continued to campaign strenuously for the reduction of death on the roads. In October a copy of the new *Highway Code* was distributed to all householders in the country.

Although there were serious railway accidents during the year, the number of fatalities was comparatively small. The year was also singularly free from industrial and mining accidents.

During the first 9 months of the year a total of 270,000 passengers were flown a total of 24,000,000 mi. by British-operated civil aircraft; four accidents resulted in the deaths of 29 passengers and 11 crew, and serious injury to 1 passenger and 2 crew. (See also DISASTERS; FEDERAL WORKS AGENCY.)

(J. LN.)

SAFETY DEVICE ATTACHED TO WRISTS of a punch press operator in a Pennsylvania plant in 1946 automatically pulls them out of the way of the descending press

Acheson, Dean Gooderham (1893—), U.S. government official, was born April 11, in Middletown, Conn. He graduated from Yale university, 1915, and received a law degree from Harvard three years later. He served as a naval ensign in World War I, and later became private secretary to Louis D. Brandeis, associate justice of the U.S. supreme court. He then engaged in law practice. In Feb. 1941 he was appointed assistant secretary of

state, and with the formation of the United Nations Relief and Rehabilitation administration in 1943, Acheson became the U.S. member of its council. After the resignation of Joseph C. Grew, Acheson was named (Aug. 16, 1945) to succeed him as under-secretary of state.

In 1946 Acheson supported the U.S. loan to Great Britain declaring (Jan. 12) that it would prevent division of the world into "warring economic blocs," and favoured (June 18) a U.S.-Argentine defense pact provided Argentina eliminated its "axis influences." He warned (Dec. 8) that no nation would receive "free relief" from the U.S. after disbandment of U.N.R.R.A. The expedition of Adm. Richard E. Byrd to the antarctic which again focused attention on ownership over the south pole regions brought from Acheson the statement (Dec. 27) that the U.S. had not recognized claims of other countries in antarctica.

Actors and Acting: *see* THEATRE.

Aden. A British colony, seaport and territory in southwest Arabia, including Perim island in the strait of Bab-el-Mandeb between Africa and Arabia. Area: 80 sq.mi.; pop. (est. 1939) 48,192. Aden protectorate, including Socotra in the Indian ocean, 112,000 sq.mi.; pop. (est.) 600,000. Language: English and Arabic; religion: predominantly Mohammedan. Governor and commander in chief: Sir Reginald S. Champion.

History.—The crown prince of the Yemen visited Aden in April and May 1946. On June 28 Aden ceased to be a full naval base. Plans of the development committee envisaged a large civil hospital, new schools, public works and an irrigation scheme for the protectorate. (J. RA.)

Finance.—Revenue (est. 1945-46) Rs.9,289,790; expenditure (est. 1945-46) Rs.7,512,930. Currency: Rs.1=1s.6d. or 30.16 U.S. cents in 1946.

Trade and Communication.—External trade, 1944 (merchandise and treasure on private account): imports Rs.204,395,944; exports Rs.115,857,087. Communication: shipping (1944), 2,741 merchant vessels (1,447 British) entered the port of Aden; total tonnage (net) 10,707,745; motor vehicles registered (Sept. 30, 1939) 733 cars, 207 commercial vehicles.

Production.—In 1938-39, tobacco (approx. value of crop) Rs.547,810; salt (export) 273,622 short tons; coffee (export 1939-40) 6,160 short tons.

Adjusted Compensation: *see* VETERANS' ADMINISTRATION.
Adult Education: *see* EDUCATION.

Advertising. In spite of pains of reconversion suffered by business in the United States in 1946, the volume of advertising made substantial gains. Figures for 1946 and 1945 are as follows:

Advertising Expenditures
(Millions of Dollars)

	1946	1945
Newspapers	\$964	\$660
Radio	489	400
Magazines	430	330
Direct mail	279	270
Trade and business papers	178	107
Outdoor	86	90
Farm papers	36	29
Miscellaneous	520	500
Total	\$2,982	\$2,386

Advertising was promoted during the year by the general prosperity of the United States, but was hampered by strikes, shortages, rising prices and other maladjustments. According to the department of commerce, consumers in 1946 spent \$127,000,000,000 for goods and services, an all-time record even when these figures are adjusted for price advances. This amount

The extra Packard Clipper
we could have built—but didn't

The extra Packard Clipper we could have built—but didn't—was a car that was never built. It was a car that was designed to be built, but the war had ended before it could be built. The car was designed to be built in 1946, but the war had ended in 1945. The car was designed to be built in 1946, but the war had ended in 1945. The car was designed to be built in 1946, but the war had ended in 1945.

The extra Packard Clipper we could have built—but didn't—was a car that was never built. It was a car that was designed to be built, but the war had ended before it could be built. The car was designed to be built in 1946, but the war had ended in 1945. The car was designed to be built in 1946, but the war had ended in 1945.

PACKARD
FOR THE MAN WHO DOES THE

DIFFICULTIES of achieving full production, that marked the year 1946, were reflected in this Packard motorcar advertisement. It explained that some productive facilities were used for manufacturing new parts for old cars instead of new automobiles.

was 20% higher than for 1945.

Advertising was hampered by strikes. In the case of New York city newspapers, for example, advertising was completely eliminated for some days because of a newsprint shortage caused by a trucking strike. During the year there were some \$10,000,000 of cancellations of advertising contracts by radio advertisers, who felt that interruptions to production made it unprofitable to advertise.

Another problem was the rising cost of advertising. Students of advertising concluded that while there had been a decided rise in the rates of most media, there had not been an increase in relative cost because of the increases in sizes of audiences reached. For example, the cost to reach 1,000 readers of an average magazine was 16% less in 1945 than it was in 1935, although the actual cost of advertising space had increased 10% during those years. In radio, the growth of the audience had reduced relative cost by 9% from 1935, although cost of time was 55% higher. Factors that did represent positive increases in advertising costs were rises in mechanical preparation costs and in radio talent.

Content of advertising was marked by a return to selling copy. This was in contrast to the institutional or public relations copy that had been employed so extensively during World War II.

There was still a considerable amount of public relations copy used, however, but for different reasons. One was the struggle between management and labour which characterized the year, and in which both sides frequently stated their cases in large advertisements. There was also the feeling on the part of many leaders, especially the Association of National Advertisers, that advertising should be used to promote the system of free enter-

prise as well as to sell goods.

The Advertising council reported at the end of 1946 that during the year more than 100 advertising agencies had served as volunteers on more than 170 public service campaigns sponsored by the council, in co-operation with government and private organizations. It was estimated that U.S. business had contributed more than \$100,000,000 in the year through its advertising time, space and services to the realization of council projects such as those concerning atomic energy, safety, world trade, intergroup and interfaith understanding.

During the year the Lanham Trade Mark act was passed, to take effect July 5, 1947. It gives protection to trade-mark values.

Ralph Starr Butler, vice-president of General Foods corporation, received the gold medal of the Annual Advertising Awards for distinguished service to advertising.

Newspapers.—The bureau of the census released in the autumn of 1946 its special 1945 census of printing and publishing, revealing that gross receipts of newspaper publishers had increased 47% between 1939 and 1945. It was also announced by the American Newspaper Publishers association that 51,000,000 persons in the United States and Canada bought newspapers every weekday, putting newspaper circulation at an all-time high.

An analysis by the A.N.P.A. revealed that of 1,748 daily newspapers in the United States, 251 had increased prices of their copies in the first part of 1946, while only four had lowered their rates. Only one newspaper in the United States, the *Mechanicsburg* (Ohio) *Telegram*, continued to sell for one cent. Only 42 newspapers sold for two cents, whereas in 1943 there were 84.

As newspaper circulations continued to climb to all-time highs and advertising rates remained relatively constant, advertising costs to reach each individual reader were diminishing. The A.N.P.A. estimated a 5,000-line campaign in 1,735 weekday newspapers in the United States would cost \$690,994 or \$.01478 a reader or impression.

Many surveys and market studies were conducted by individual newspapers or groups. The Advertising Research foundation summarized the Continuing Study of Newspaper Reading, covering seven years' measurements of the reading of more than 3,000 newspaper pages. It showed that whereas readership of advertising increased from prewar days, that of such items as financial news, radio news, sports and comics declined.

American Newspaper Advertising Network was formed during the year, its purpose being to demonstrate to advertisers the value of the daily newspaper medium and to show that the network provided a means to use such newspapers economically.

Great Britain's national newspapers issued six-page editions in Oct. 1946 for the first time in more than five years. The extra pages were used for features and human interest stories with no appreciable difference in length of overseas reporting.

During most of the year the big nationals were still limited to four pages, because the end of the war did not remove paper rationing in Great Britain, as it did in the United States. Advertisements were restricted to space three inches deep by two columns wide, and this small space was forcing the advertiser to get his message into 35 or 50 words and the art director to achieve distinctive appearance and good visibility in spite of the small space at his disposal. Frequency of insertions also had to be cut, so drastically that most publications soon limited insertions to one a month. Often they were not able to allow this much. (See also NEWSPAPERS AND MAGAZINES.)

Radio.—Radio was affected by rising costs no less than other media. Increased time costs were more than offset by the larger audiences reached.

Radio research saw interesting developments. One was the

FOOD FACTS

DON'T TAKE IT IF YOU DON'T WANT IT

suspension of the co-operative analysis of broadcasting's service on radio program rating.

In the early autumn the Broadcast Measurement bureau issued its first report on radio station and network audiences for which it had been preparing nearly two years. B.M.B. is a co-operative enterprise supported by the American Association of Advertising agencies, the Association of National Advertisers and the National Association of Broadcasters.

Radio continued during the year to receive criticism. Early in 1946 the Federal Communications commission criticized "advertising excesses," and stated that the amount of time devoted to advertising matter should bear a reasonable relationship to the time devoted to programs. At the convention of the National Association of Broadcasters in the autumn, leaders in radio admitted so-called excesses of radio advertising and urged that they be corrected. A survey taken at the end of the year showed that 70% of the nation's stations were applying stricter standards controlling length or content of commercials.

Resumption of commercial broadcasting in the Union of South Africa probably in June 1947 was announced by the broadcasting board of the union. The South African radio, like the British Broadcasting corporation, is government controlled and commercial radio has been banned from 1936. It was believed that the general level of broadcasting in the union would be improved by the competition of commercial programs.

In the middle of 1946 it was announced that there would be built in the New York metropolitan area a \$60,000,000 television motion picture production centre for networks, radio and telecasting stations, national advertisers, advertising agencies and independent producers.

NEWSPAPER ADVERTISING (total linage in 52 cities of the United States): average per month. Compiled by Media Records, Inc.

The question of colour television was debated during the year, between producers who wished to use colour immediately and those who felt it would be desirable to wait till the technique was further advanced. (See also RADIO.)

Magazines.—General magazines continued to prosper in 1946. The year also saw an accentuation of the trend toward increased price per copy. Over late years there had been spectacular gains in circulation, with the ratio of subscription to newsstand purchases almost reversed. In 1935 the ratio was 70 to 30 in favour of subscriptions, while in 1945 it was 40 to 60 in favour of newsstand sales. It was estimated that in the previous decade, 1935-45, magazine circulations had increased so that the unit cost of advertising in them was 16% lower.

During the year the bureau of the census reported that gross receipts of magazine publishers doubled between 1939 and 1945. The summary showed that 792 publishers who did 49.4% of the magazine business in 1939 had gross receipts of \$402,847,000 in 1945, up 99.2% from the base year.

An analysis of net paid magazine circulation and subscription production was released in July 1946 by the Association of National Advertisers. It showed that the average net paid circulation of 21 of the nation's leading magazines increased 12% between 1941 and 1945, this in addition to an increase of 29% in circulation between 1930 and 1940.

One of the outstanding developments continued to be comic books. The first of these had appeared in 1933, but they had a rapid growth during World War II, and by the end of 1946 one publisher alone, with 26 books or titles, boasted circulation of 26,340,000.

An interesting phase of magazine publishing was the growth of foreign editions of United States magazines. The *Reader's Digest* increased its foreign editions by five: French language editions in France and Canada, and Australian, Danish and Japanese editions, giving it 12 foreign editions published in nine languages. All of these editions took advertising except the British. *Life International*, the world-wide edition of *Life* magazine, also began publication in 1946.

Direct Mail.—A survey taken in 1946 by the Direct Mail Advertisers association among 876 members and other advertisers, showed that 776 reported a total of \$133,376,578 as their expenditure for all advertising in that year, and that of this,

28.5% or \$38,013,000 went for direct advertising. By direct advertising was meant direct mail, plus all unmailed printed promotion-product literature, dealer helps, printed point-of-sale material, house organs, catalogues, printed public relations materials, annual reports, package inserts, calendars, letters.

These companies reported the percentage of their gross sales appropriated to advertising was 7.26%, compared with 5.76% in 1941. More than half of the companies said they fixed their advertising budgets by appropriating definite estimated amounts to accomplish given ends, and 54% said they established their budgets in the months of November, December, January. There were 57% who said that they used market research before planning their direct advertising. Respondents reported direct mailing lists of 78,666,098, and most respondents said that present customers receive the highest percentage of their mailings, with new customers next, then inactive accounts.

Outdoor Advertising.—Volume of expenditures for outdoor advertising in 1946 showed an increase over 1945 of 22.9%, and volume already booked as of Dec. 31, 1946, for 1947 was 13.7% higher than for the past year. Greatest gain was in the food classification, which was 137.8% higher in 1946 than in 1941.

Copy showed a trend to a more prominent display of packages and trade names, the former because of the rapid growth in super markets and self-service stores, where the consumer makes a visual selection of desired products, and name advertising to feature new products or re-establish old ones that had been temporarily missing during the war.

A new poster panel design, created by Raymond Loewy associates, was adopted as a standard. It is 12 ft. 2 in. by 24 ft. 6 in., with a poster display surface of approximately 9 ft. by 21 ft. 4 in. It permits use of a 26-sheet poster as well as the traditional 24-sheet. Erected on three uprights, without apron or platform base, it permits of appropriate ground treatment.

The Traffic Audit bureau launched a program during the year to find new measurements for the values of outdoor advertising. Ft. Wayne, Ind., was set up as a test pilot city. Numerous facts were gathered as to where people go outdoors, routes they follow, what time of day they go outdoors, and what panels they had an opportunity to pass. A study was also made on readership, showing effect of posters and relating readership to circulation.

Business and Trade Papers.—In an effort to predict advertising activities in 1947, the Associated Business Papers questioned 800 agencies, found that 43% said 1947 advertising appropriations would be larger than in 1946; 45% said the same; 8% said smaller; 4% didn't know.

Reporting on the business paper advertising situation, *Industrial Marketing*, in its September issue, stated that although advertisers generally were planning record budgets for 1947, they were concerned over rapidly rising space and graphic costs. Business paper publishing costs rose approximately 33% after 1939, while rates (on a per 1,000 circulation basis) increased only 8.6%. Although rates had increased about 47% in this period, circulations had increased more than 35%.

Copy and Layout.—Advertising continued to gain from research. Daniel Starch reported that after 15 years of studies of effectiveness of magazine advertising he had concluded that thorough readership had increased 24%. He issued another study showing that of 583 advertisements, among those having the same readership the ones containing helpful information sold twice as much goods as those which did not contain such information. This demand for more information in advertising was echoed by the Federal Trade commission and others.

Advertisers sought to increase their results by use of colour. The Newspaper Advertising Executives association published a

booklet urging use of colour, in which it quoted a previous study by Daniel Starch showing that on the basis of 5,000,000 inquiries from 3,500 advertisements of 163 firms, colour advertisements brought 53% greater returns than black and white.

Consumers.—Many consumer studies were made during the year. One made by the Brand Names foundation reported that public credence in advertising had been damaged after 1936, stating that 45.5% of those interviewed discount advertising only slightly; 28.1% considerably; 16.5% greatly; and 9.8% totally. Also, 30.5% discount advertising more than they did ten years ago; 49.4% about the same, and 20% less.

Foreign.—In France in 1946 the press was only beginning to come back into its own; there were about 30 dailies and the number was increasing. Circulations of the chief papers ranged from 300,000 to 500,000. Milline rates were high, and yet there was little advertising space available. Because newsprint was still severely rationed, most newspapers were restricted to single sheets. There were 113 general and women's magazines published weekly or monthly.

In Belgium daily newspapers were from four- to six-page issues, and advertising rates were approximately three times those of prewar years. There were nine important national papers appearing, with a total circulation of more than 1,000,000. There was a great demand for publicity films in Belgium. Advertising in the Netherlands continued to be hampered by shortages of newsprint and materials.

In Sweden there were 272 dailies, 45 magazines, 299 trade journals. Many U.S. firms, during World War II continued to advertise in the Swedish press. Advertising films were widely used. Sale of English and U.S. newspapers and magazines was restricted in Spain. Advertisers had use of a wide range of Spanish publications, however, with circulations from 1,500 to 350,000.

Afghanistan. A Moslem kingdom lying between India and Iran. Area: c. 270,000 sq.mi.; pop. (est. 1946): 12,000,000. Chief towns (pop. est. 1946): Kabul (cap., 206,200); Kandahar (77,200); Herat (75,600); Mazar (41,900). Language: Persian, Pashtu; religion: Mohammedan. Ruler: Mohammad Zahir Shah; prime minister: Sardar Shah Mahmud.

History.—On June 13, 1946, an agreement was signed in Moscow by Vyacheslav Molotov and Sultan Ahmad Khan, Afghan ambassador, re-establishing the frontier which had existed between Afghanistan and imperial Russia; the new treaty concerned the frontier line along the Penj and Oxus rivers and provided for the incorporation in the U.S.S.R. of the Kashka district, ceded to Afghanistan in 1921.

Application for membership of the United Nations was made on June 5 and approved on Aug. 29; Afghanistan was admitted as a member by the assembly on Nov. 9.

Sardar Shah Mahmud succeeded Sardar Mohammad Hashim as prime minister in May.

Education.—1946: schools 369, pupils c. 100,000; the University of Kabul was extended to five faculties.

Finance.—1946: currency, Rs. 3.95 (Afghan)=Rs. 1 (Indian)=30.23 U.S. cents.

Trade and Communication.—Foreign trade: exports (1945-46) Rs. 718,431,373; exports to Great Britain (1945) Rs. 105,300; imports from Great Britain (1945) Rs. 737,100. Roads

(1945): motor roads 5,950 mi., caravan roads c. 7,000 mi. At the beginning of 1941 there were five wireless stations in the country.

Agriculture.—By 1945 one-fifth of the soil was under cultivation. Production for export, 1945-46 (in short tons): dried fruit 44,000; wool 7,700; cotton 4,400; karakuls 2,400,000 skins.

Agricultural Machinery: see AGRICULTURE.

Agricultural Research Administration.

An agency of the United States department of agriculture established in 1941 to direct and co-ordinate research in the department, the ARA comprises seven bureaus whose functions are for the most part the conduct of research. These are: bureau of agricultural and industrial chemistry, bureau of animal industry, bureau of dairy industry, bureau of entomology and plant quarantine, bureau of human nutrition and home economics, bureau of plant industry, soils, and agricultural engineering and office of experiment stations.

During the years of World War II food consumed by U.S. civilians contained more calcium, iron, B vitamins, vitamin A and vitamin C (ascorbic acid) than at any time from 1909. This fact was brought out in a study of the nutritive value of the nation's food supply covering the period 1909-45, made in 1946 by the bureau of human nutrition and home economics. Important factors in bringing about these wartime nutritional gains were increased consumption of milk, eggs, vegetables and fruit, and the enrichment of white bread and flour. Calorie and protein consumption during World War II was somewhat higher than in the 1930s, but not above that in 1910-20.

Over the course of the whole period, there was a steady increase in calcium, vitamins A and C, and riboflavin in the B-vitamin group. The rise in calcium and riboflavin was caused largely by greater consumption of milk, the rise in vitamins A and C by increased use of fruits and vegetables. Accounting in large measure for this increase in vitamin C was the more-than-four-fold increase of citrus fruits after 1909.

Thiamin and niacin hit all-time lows in 1935, coincident with a sharp fall in meat supply, especially pork. From that time, these values were on the upgrade, associated in part with high meat consumption, in part with enrichment of a large proportion of the flour, bread and cereal.

A study such as this, revealing trends in national food habits over a long period, furnishes perspective against which to appraise current supplies, probable effect of food emergencies and the nutritive value of the food of various nations.

Public demand for increased supplies of meat and other livestock products emphasized the need for the development of superior and more efficient types of livestock and more economical methods of feeding. An illustration of research directed toward satisfying this demand was the bureau of animal industry's work in developing superior strains of swine from various crosses involving the Danish Landrace, the Large Black and the breeds already common in the U.S.

A co-ordinated federal-state research program directed toward the suppression of the highly infectious poultry malady, Newcastle disease, was begun in 1946. The program covered

five main fields of study. One was to determine the losses caused by the disease in various states and the efficacy of field control methods. The disease was positively diagnosed in 29 states. A second field of research was to develop accurate and rapid diagnostic methods. A third was to determine the efficacy of various physical and chemical agents for destroying the virus which causes Newcastle disease. A fourth dealt with obtaining more information on the manner in which the disease spreads. The fifth field of study was the preparation and testing of more effective vaccines.

This five-point program supplemented research work already being conducted in the laboratories of the states and the federal bureau of animal industry. A national committee on Newcastle disease reported an urgent need for the development and application of practical control measures. Besides being highly infective, Newcastle disease has a grim history of high mortality in growing chicks and reduced egg production in many affected flocks.

Among the more significant results of research reported in 1946 by the bureau of dairy industry was a summary of a long-time experiment in cross-breeding of dairy cattle, begun in 1939.

Four dairy breeds were used in making the crosses. These were Holstein, Guernsey, Jersey and Red Danish. All animals used in the original crosses were purebred. The sires were all proved at Beltsville, Md., at the agricultural research centre. (A proved sire is one whose ability to transmit capacity for high production has been measured by comparing the milk and butterfat production of five of his daughters with that of their mothers.)

One question to be answered by this crossbreeding experiment was whether hybrid vigour would be developed, as is often the case with plants and some other livestock. The plan of the experiment differs from the usual pattern of crossbreeding, often

employed by dairymen, in that it calls for continuous introduction of new genes (units of inheritance) through the use of proved sires of the respective breeds.

For example, the females resulting from the mating of any two of the breeds, such as Holsteins and Jerseys, are mated to the Red Danish sire for a three-breed cross. Then the resulting three-breed females are mated to either a Jersey or a Holstein proved sire in the third round of the three breeds involved.

Production ability of the females is determined in the first lactation period under uniform barn-feeding and dry-lot environment, with pasture. All cows are milked thrice daily for a 365-day lactation period and bred about four and one-half months after calving.

Large-scale tests in 1946 showed that losses estimated at \$100,000,000 a year could be prevented by controlling blood-sucking flies on cattle. These demonstrations were an outgrowth of experimental work by entomologists of the department and co-operating state agencies.

Cattle sprayed with water-dispersable DDT gained an average of 50 lb. per animal over untreated stock during midsummer, when flies were most troublesome. Other tests showed that gains in milk production ranging from 10% to 15% could be expected during the same period by spraying milk cows with DDT.

One pound of DDT is sufficient to treat 40 animals during the fly season. At the rate of gain indicated in the tests, cattlemen may expect as much as 2,000 lb. of beef for each pound of DDT used.

Other work in the bureau of entomology and plant quarantine during the year covered a broad attack on insect enemies. This attack included various methods of biological insect control with parasites and diseases, testing and evaluating many new insecticides, further work with DDT to determine its effects upon soil, plants and animals, further improvements in methods of dispersing insecticides and large-scale operations against insects such as the gypsy moth, that are now confined to a relatively

SPRAYING CORN WITH DDT in experimental attack on corn borers in 1946. Tractor sprayer has high seats to keep operators above the mist

small area.

Research on production of synthetic liquid motor fuels from farm residues moved another step toward evaluation during 1946, when the bureau of agricultural and industrial chemistry started operation of a new semi-works plant at the Northern Regional Research laboratory, at Peoria, Ill. The new plant was designed to produce 500 gal. of alcohol daily and was part of the general research program, authorized by congress in 1944, to study possibilities of producing liquid motor fuels from non-petroleum sources, such as oil-bearing shales, coal, gas and agricultural products.

The experimental work was planned to show maximum yields of alcohols, butanol and acetone from a given tonnage of various agricultural residues and to provide a basis for computing costs and determining the feasibility of commercial production. If experimental laboratory results were borne out in the semi-works operation, from 90 to 95 gal. of liquid motor fuels would be obtained from each ton of residues, about half in the form of ethyl alcohol. The ultimate aim is not to supplant gasoline as a motor fuel but to test the possibilities of making these fuels cheap enough for use as a blending agent.

This and other work of the bureau is aimed at finding new uses for crops which at times may be in surplus, and the utilization of residues which are available in fairly constant quantity each year. These include corncobs, sugar cane bagasse, peanut shells, flax shives, and the hulls of oats, cottonseed and rice. Cereal straws, cornstalks and the like can also be used in the process. Agricultural residues are estimated at 200,000,000 tons a year.

Research on the production and utilization of cotton emphasized the advantages of growing improved varieties that are more uniform in fibre length and quality. Production of large commercial lots of uniform quality is possible only when growers of an area agree to standardize their crop by growing the variety best suited. The bureau of plant industry, soils, and agricultural engineering had co-operated with cotton-growing states for many years in helping farmers to organize one-variety communities so that they could get the maximum benefits from state and federal research.

One of the biggest factors in U.S. cotton production has been the steady expansion in the number of one-variety communities throughout the cotton belt. In 1946 these organized communities had 40% of the acreage and grew 45% of the entire U.S. cotton crop. Until a few years before about 500 varieties of cotton were being grown. Now most of the acreage in one-variety communities is devoted to four variety types, and cotton specialists of the department believe that all requirements could be met with fewer than ten varieties. During 1946 increased income to growers in one-variety communities, because of larger yields and premiums for the better quality of their product, was estimated to be \$62,000,000.

(W. V. L.)

Agriculture. U.S. agriculture as an industry enjoyed the most prosperous year in its history in 1946. It became a \$100,000,000,000 industry as the U.S. department of agriculture estimated the value of agriculture as a composite business to be \$101,522,000,000 on Jan. 1, 1946, with equities of \$93,185,000,000. When the gains from the record year 1946 were added the total was well over the \$100,000,000,000 mark. Bumper crops, surpassing all previous records, high prices and a strong buying power of consumers were the features of the year. This fine crop year followed a period of eight years of generally favourable weather, and with the high production of the four previous years reached a total beyond all forecasts. Farm people found themselves in a strong financial position with debts reduced to the lowest level in a generation and assets of

GROSS FARM INCOME: net income and production expenses of U.S. farm operators, 1915-46, including government payments beginning in 1933. Compiled by the U.S. bureau of agricultural economics. 1946 data are tentative estimates

more than \$20,000,000,000. Only those older farmers who remembered the depression that followed World War I had any misgivings regarding the future. They noted the decline in foreign markets and wondered if surpluses would again accumulate to stimulate a demand for governmental intervention.

The parity price guarantees that had been carried through the war period were expected to continue through 1947 and 1948. If high employment continued through 1947 as it had in 1946, consumer buying was likely to keep consumption of farm products at the high level of 1946. World food production was still 8% to 10% below minimum needs and the surplus was not likely to be serious until 1948.

The year 1946 with its high production marked a turning point in several branches of agriculture. The livestock cycle, which turned downward in 1945, continued with only a slight hesitation. While the government urged that a 3% larger acreage be planted for 1947, few authorities expected that this would follow. Cotton production appeared to have reached the limit of its era of high prices and low production. Government policies continued with little change through the year, but the attention of organized farmers was directed toward the future and the probable price decline. The rapid mechanization of agriculture was increasing the output per worker as well as per acre. Production per worker rose more than 35% after 1937 and the number employed in agriculture declined 10%. In 1946 crop production exceeded the previous record of 1942 when the weather was not so good; consequently the gain is attributed to better methods and more machinery.

Crop Production.—The grand total of crop production in 1946 was the largest in U.S. history. A favourable growing season which assured high yields on a large acreage was the principal factor in attaining this remarkable record. The total

*Estimates by the U.S. department of agriculture.

volume of crops was estimated by the U.S. department of agriculture at 7 points on the index above the total of 1945, 2 points above the previous record in 1942 and 26 points above the 1923-32 average. Quality as well as quantity of nearly all crops was high due to the favourable harvesting season in late summer and fall.

The crops making new high records of total production were: wheat, corn, rice, potatoes, tobacco, soybeans, peaches, pears, plums, cherries and truck crops. Near-record crops were harvested of oats, peanuts, grapes and hay. A few of the former leading crops were smaller than average. Cotton was the smallest crop after 1895 except the one year 1921. Barley, rye, beans, flax and several minor crops returned low total crops.

Table II.—Production of Principal U.S. Crops, 1933-46

Year	(In thousands)							
	Corn bu.	Oats bu.	Wheat bu.	Cotton bales	Timothy hay tons	Rice bu.	Tobacco lb.	Potatoes bu.
1933	2,399,632	733,166	551,683	13,049	66,530	37,651	1,371,131	342,306
1934	1,461,123	542,306	524,393	9,636	55,270	39,047	1,081,629	406,105
1935	2,303,747	1,194,902	626,344	10,638	78,138	38,784	1,297,155	386,380
1936	1,507,089	785,506	626,766	12,399	63,536	49,002	1,154,131	331,918

1946	3,287,927	1,509,867	1,155,715	8,482	89,330	71,520	2,235,328	474,609

The acreage of the 52 principal crops was 345,773,000 ac., slightly less than the three previous years but larger than any year in the period 1933-42. This area was below the acreage cultivated during the 1929-32 period. Low prices usually lead to expansion as does the stimulation of war demand. The South Atlantic region harvested the smallest acreage in 18 years, which reflected the restriction of cotton growing.

The central and western regions planted record large areas. The large acreage was made possible by the favourable spring planting season and also the relatively small abandonment which required little replanting. This amounted to only 2.7% of the planted area.

UNITED STATES food production, as measured by index numbers, maintained a record high level in 1945 and 1946, after the end of World War II. Livestock declined slightly in 1946 while food grains advanced to a new high record.

Table III.—U.S. Production and Yield Per Acre, 1946 and 1945

Field Crops	1946		1945	
	Yield	Production in thousands	Yield	Production in thousands

Grapefruit, crates	67,320	...	63,550

The reconversion of farm plans from the wartime economy was not yet evident. The large demand for food and feed and government guarantees for continued price support for two years encouraged farmers to continue large-scale production. The labour supply was larger and machinery somewhat easier to buy.

Yields of principal crops were at high levels in 1946. Corn, potatoes and tobacco made new records and the majority of crops were better than the average. The yields of 28 crops were 134.2% of the 1923-32 average, exceeded only in 1942 when the acreage was smaller. The average for 10 fruit crops was 163.8% of the base, nearly 25 points above any previous crop. The feed crops, hay, feed grains and pastures also yielded at a high level. Oilseed crops were 3% smaller than in 1945 but 13% above the 1935-44 average. The deficit was in cottonseed and flaxseed, which was partly offset by big crops of soybeans and peanuts. Fruits as a group returned the largest volume ever harvested. Apples recovered from the short crop of 1945 and citrus advanced to new high levels. The total of truck crops was nearly 10% above any previous record for both fresh market and processing. Of 11 vegetables the total was 18% above 1945, 8% above the high year 1942 and nearly 50% above the prewar average. Seed crops of all grasses and legumes were large at the time of great demand for reseeding after the war period and for relief shipment.

Corn, the nation's most valuable crop, made a new record in yield per ac. and total production on a relatively small acreage. The advances in seed corn breeding were shown more strikingly in this crop than ever before. In only five years after 1896 had the total acreage been smaller, but the record yield of 37.1 bu. per ac. offset the smaller area. Hybrid seed was planted on 67.5% of the total area and on 91% of the corn belt lands. The long growing season was an important factor in increasing the yield, however.

The 1,156,000,000 bu. wheat crop was 4% above the record of 1945 and was the third 1,000,000,000 bu. crop. The only record not broken was that of spring wheat, which made its record in 1915. The 1946 crop was due largely to the large area of winter wheat sown in the fall of 1945, small winter losses and a good growing season in the spring. This large seeding of winter wheat followed the government's appeal for grain for relief needs in 1946. Durum wheat did not yield so well in the Dakotas because of drought.

Of the feed grains, oats returned a second 1,500,000,000 crop, almost up to the record of 1945. Barley and rye declined, the latter returning the smallest crop from 1934. The total hay crop was 14% above the 10-year average, and alfalfa 6% above average. Peanuts and soybeans were large while cowpeas declined for the sixth year in succession. Buckwheat was also a

COMBINES harvesting a wheat crop in Nebraska, in 1946

short crop. Maple products were also the smallest on record except for the almost complete failure in 1945.

Tobacco continued to grow in importance, particularly in the south where it had taken the place of cotton on many farms. The 2,235,000,000 lb. crop at current prices made the crop one of the most valuable. All types were grown on expanded acreage. Cotton production declined, particularly because of the reduced acreage and a yield of lint the lowest after 1936. The total crop, estimated in Dec. at 8,482,000 bales, was 5.9% below the crop of 1945 and the smallest total after 1895 except for the one crop of 1921. This was a steady decline from the high record of 18,946,000 bales produced in 1937.

The steady increase in fruit production was shown by the record crops of citrus, both oranges and grapefruit, peaches, pears, grapes and plums. The Pacific coast states, Florida, Texas and Arizona were developing highly commercial fruit areas steadily. Both fresh fruit and processed supplies were finding ready markets. California became more important than ever in grape production with 93% of the total, over half the citrus fruit and a large share of peaches, pears, prunes, apricots, olives and many other fruits and nuts.

Potatoes harvested in 1946 amounted to the record total of 474,609,000 bu., 2% above the record crop of 1943. The remarkable fact was the high yield per ac., 184 bu. compared with 155 bu. in 1945. The supply of potatoes glutted the markets and some government purchases spoiled before they could be used even for feed. The output of truck crops included high record production of lettuce, onions, tomatoes, celery, peppers, cauliflower and eggplant.

Livestock Production.—The declining cycle of livestock numbers was checked in 1945 and revised estimates of the num-

ber on farms on Jan. 1, 1946, showed a total of 146,555,000 animal units compared with 146,187,000 units a year earlier. All classes of livestock declined in numbers except hogs and poultry. The strong demand for meat and the abundant supplies of feed checked the trend. The cattle feeding industry received a great boost when meats were decontrolled and the movement of cattle to feedlots increased. The large corn crop was also a favourable factor. The confusion over price control, black markets and the public clamour for more of the better grades of beef led farmers to feed hogs to larger sizes and to finish cattle as heavy as possible.

Hog numbers on Jan. 1, 1946, were estimated at 62,344,000 head compared with 59,759,000 head a year earlier. The pig crops, spring and fall, totalled 52,324,000 head, which was about the average 1941-45. With the large corn crop the goal for 1947 was set at 58,000,000 head. Hog prices responded as other livestock prices when price control lapsed in July and rose to \$20.90 per 100 lb. and then rose again to an average of \$22.70 in December.

Cattle slaughter was lower in the first half of 1946 than a year earlier but increased quickly when price control lapsed in July. The markets were glutted. Prices advanced to a top of more than \$30 per 100 lb. at Chicago, Ill. The average price to farmers for the country as a whole rose from \$14.10 per 100 lb. in June to \$17 in Aug., \$18.10 in Oct. and \$17.40 in Dec. The large supplies of feed were expected to be reflected in a larger supply of winter-fed beef. Sheep continued to decline in numbers and lamb feeding was limited by the smaller number of lambs raised. The meat supply, not including poultry, was estimated at only slightly less than that of 1945 when consumption was 137 lb. per capita. Civilians were expected to have about 145 lb. per capita, however, because of reduced requirements for the military forces and for export.

The dairy industry declined about 4% in number of milk cows kept but produced within 2% of as much milk as in 1945. The production per cow was higher because of the culling of some of the poorer cows. Butter production, though still low, was beginning to recover by the last quarter of 1946. More cheese was available for domestic consumption as export demands declined. Per capita milk consumption was expected to be about 813 lb. which is about the same as the prewar average 1935-39.

The poultry industry declined slightly from the level of 1945 in egg production. This was because of the high price of feed grains during the first half of the year. The commercial broiler business steadily increased, however, providing a supply of meat about 15% below that of 1945. Turkey production was high but not equal to the big crop of 1945.

The decline in horses and mules continued and shipments of animals to Europe for replacements accelerated the change; over 100,000 head of mares were shipped, mostly to eastern Europe. The slaughter of horses continued large. The prices of mules were maintained at near the prewar level, almost entirely in the southeastern states.

Food Stocks.—The record production of foodstuffs in the United States during 1945 and 1946, with the decreasing military and lend-lease requirements, made larger amounts available for consumption. The public clamour about meat shortage, etc., was in general without justification except during short periods when price control and other government intervention had disturbed the normal flow of supplies. Estimates by the U.S. department of agriculture to midyear 1946 indicated that total food production, compared with an average of 1935-39 as a base of 100, equalled 133 in 1943; 138 in 1944; 136 in 1945 and 134 in 1946. Since there was a considerable increase in 1946 production after July, production in 1946 was probably equal to the record of 1944. The supplies available to civilians for consumption increased steadily from 1943 on as military and other requirements declined. Measured in another way, of the total U.S. food supply for 1945-46, 83.8% was available to civilians, 12.2% was exported and the remaining 4.0% was used by the military services. In terms of food energy the exports from the United States in 1945-46, July to July, were sufficient to provide 250,000,000 people with 500 calories per day for 1 year. These additional supplies were to supplement the less than 2,200 calories regarded as necessary to prevent serious hunger. Exports did not deprive the U.S. consumer of supplies except of some foods that could be replaced by others. The food energy of the average U.S. civilian was maintained at 3,300 calories per capita which was the same as in the prewar period 1935-39.

Flour for domestic consumption was limited to 75% of the amount used in 1945 during the spring months of 1946. Large quantities of rice were exported to the far east. Corn products were scarce because of the heavy demands for many uses. Dairy products were needed for relief and about one-fourth of the cheese production, one-third of the condensed milk and 40% of the dried milk was exported. Only about 6% of the meat supply was exported. Canned fish and dried beans were large items in the list of exports. Fats and oils exports amounted to about 12% of the supply. Sugar continued to be short to the end of the year with not much prospect of larger supplies until well into 1947. (See FOOD SUPPLY OF THE WORLD.)

Farm Prices.—The demand for farm products in 1946 exceeded expectations at the beginning of the year. It was not thought probable that the large production could be continued at the time of shrinking need for war purposes without causing at least a slight decline in the price level. Inflation was feared but price control was expected to check that tendency. But the general price advance from July on exceeded anything ever be-

fore experienced by U.S. farmers. Livestock and crops were rushed to market to catch the top prices withheld through several weeks and did not show a general decline until the end of the year, when the decline from Oct. to Nov. was 10 points. At this time all farm prices were at a point more than 80% higher than when the United States entered World War II in 1941, and 29% higher than at the end of hostilities with Japan.

Table IV.—Farmers' Average Prices, Certain U.S. Crops, on Selected Dates
(in cents per unit)

Oct. 15, 1945	151.0	113.0	62.8	101.0	138.0	106.0	126.0	42.6	22.30
Oct. 15, 1946	188.0	171.0	79.9	135.0	199.0	144.0	122.0	51.5	37.69

Prices of all farm crops and livestock to farmers moved up steadily in 1946 from an index of 202 average for the year 1945 (Aug. 1909-July 1914 equals 100) to a peak of 273 in Oct. and then declined to 264 in Dec. 1946. All groups of farm products did not move alike. Livestock prices advanced from an index of 203 for 1945 to 294 in Dec. 1946; all crops from 201 to 232; dairy products from 197 to 312 in Dec.; and food grains from 172 to 224 in Dec. Smaller advances were recorded for truck crops, which averaged 224 in 1945, advanced to 283 by March 1946 and then declined to 166 by Dec. Fruit prices followed a similar curve, being lower in late 1946 than a year earlier. Cotton made a startling advance from 171 average for 1945 to 304 in Oct. 1946, only to drop to 242 by Dec. The averages for 1946, when available, were expected probably to show a general advance of about 30% in the second half of 1946.

When price control lapsed in July and again later when it was finally ended, the price advances were reflected chiefly in the retail markets and to a less degree in prices to producers. During the lapse period prices advanced about 15% to a level above that reached following World War I. Warnings of the probable decline of prices for farm products in 1947 were based on the facts of the very high production; shrinking foreign markets, except for relief purposes; a very high rate of domestic consumption which might not continue. The prospect was regarded as good for 1947 with lower prices in 1948 if the U.S. and world crop production should again be large.

WHEAT being shipped in open freight cars during 1946 as elevators were too full to hold the record crop; much of this grain was sent abroad for the relief of the hungry in war-devastated lands

Farm Income.—Gross farm income reached the grand total of about \$27,000,000,000 for 1946. This "gross" income included the estimated cash receipts for products sold from farms, government payments, the value of farm products used in the household and the rental value of the farm dwelling. The "realized net income" is derived by subtracting "total expenses" from the gross income. For 1946 the total expenses were estimated at \$12,300,000,000, leaving a net income for farm operators of \$14,700,000,000. This income of agriculture was the result of a combination of high production and prices, and more the latter than increase in production. This high record, which was expected to be the peak of the decade, compares with the peak of World War I, which was \$17,500,000,000 gross income in 1929. Then income remained above \$15,000,000,000 only three years while in World War II the total had been above \$15,000,000,000 for five years. The decline after 1920 was to the low point of \$6,200,000,000 in 1932.

Table V.—U.S. Farm Income from Cash Sales and Government Payments, 1945 and 1946
Jan. to Oct.
(In millions of dollars)

	1946	1945
All Crops	8,305	7,034
Food grains	1,542	1,091
Feed grains	1,294	1,123
Cotton (lint and seed)	1,093	628
Oil-bearing crops	463	391
Tobacco	753	743
Vegetables	1,421	1,407
Fruit and nuts	1,235	1,151
Other	504	500
All livestock and products	10,265	9,577
Meat animals	5,157	4,681
Dairy products	2,883	2,617
Poultry and eggs	2,036	2,074
Other	189	205
Government payments	780	715
Total—10 months (without govt. payments)	18,570	16,611

Analysis of these totals would not be made until mid-1947; consequently the best comparative analysis is in the estimates for 1945. The total gross income in 1945 was \$24,751,000,000, production expenses \$11,509,000,000, leaving a realized net income of \$13,242,000,000 for the whole United States. When divided by states and averaged among the farms of each state the variations of farm income by regions is apparent. In 1945 the average net income per farm ranged from \$6,051 in California to \$896 in West Virginia. Eleven states in the south and New England averaged below \$1,500. Eleven states exceeded \$3,500, mostly in the west but including Delaware and Florida. In the middle west Iowa led with an average farm income of \$4,209; Illinois, \$3,464; and Minnesota, \$3,145. All of the mountain states were high because the number of ranches was small and they were of large size. These are also farms with large cash sales in relation to purchases.

The average of government payments was \$117 per farm for the whole country ranging from a top of \$370 in Wisconsin to a minimum of \$31 per farm in North Carolina. States of large production where the payments were substantial were California, \$255; Wisconsin, \$370; Minnesota \$198; Michigan \$152; New York \$300 and New Jersey \$275. The total government payments in 1943 were \$590,339,000; 1944, \$715,161,000 and 1945, \$687,056,000.

Production expenses increased 5% in 1945 in the country as a whole. Labour costs were 5% higher in 1945 than in 1944, livestock purchased 31% higher, maintenance of machinery, etc., 6% higher while feed cost 4% less. Taxes advanced while farm mortgage interest declined as debts were reduced. The total bill for hired labour advanced from \$1,928,000,000 in 1943 to \$2,209,000,000 in 1945.

The total farm population of the United States was estimated to be 25,990,000 on Jan. 1, 1946, compared with 25,190,000 a year earlier. This indicated an increasing trend after the war,

SURPLUS POTATOES being dumped on the abandoned landing strip at Thunderbird field, Glendale, Ariz. The U.S. government purchased the potatoes and sold them to a distillery to convert into alcohol

since on Jan. 1944 the total number was put at 25,520,000. An increase of farm population was believed to have occurred in 1946 from the return of veterans and workers who left the farms to go to war industries. Reports on farm labour indicated an increase in both family labour and hired hands. Surveys of bank deposits and security holdings indicated that the agricultural population had more cash resources than ever before in the history of the U.S. farm. While the costs of production advanced during the war years, the high yields at high market prices increased income faster than costs on the more efficient farms.

Land Values.—The steady accumulation of money for investment with the advancing prices of farm products continued to stimulate land buying. Land values advanced steadily at the rate of about 1% a month from 1941 and continued through 1946 at this rate. By July the index was 73% above 1941, 77% above the 1935-39 level and only 14% below the peak in 1920 which was followed by the depression. Values had already exceeded the peak in three sections of the country, New England, the east south central states and Pacific coast states. In the Pacific states values were 30% above the peak in mid-1946. Repeated warnings by government and other economists failed to check the trend and at the end of the year the situation was very like that in 1920 with the exception that farmers held large cash balances and had reduced mortgage debt to the lowest amount in several years. More than half of all farm sales during 1945 were for cash and for those sold on credit the debt averaged about 60% of the sales price. Values advanced in 1946 faster than net returns. The rate of return on operated and rented farm lands continued above other investments, including government bonds which farmers usually purchase with their savings.

A million World War II veterans were working on farms by June 1946, out of the 10,000,000 veterans discharged after Aug. 1945. Some of these men with families purchased farms to operate as a business and also to solve the problem of finding a house to live in. The G.I. educational program attracted many young farm boys to enrol in agricultural schools with a view to becoming farm operators later. The "back-to-the-farm" movement did not develop as it did following previous wars,

partly because of the warnings issued by government agents. Only those with successful farm experience and training were encouraged to start farming.

Farm Taxes.—As an item in the fixed expense of agriculture taxes have increased steadily. The estimated tax bill of U.S. farmers was put at \$458,320,000 in 1943; \$475,342,000 in 1944 and \$525,291,000 in 1945. Estimates for 1946, available in the spring of 1947, were expected to show further increase. Formerly farmers paid taxes only on real estate and personal property. Income taxes affected few farmers at first but in 1946 were estimated to total \$600,000,000 per year, more than the whole farm land tax bill. A few states had income tax laws that reach farmers in the years of high income. Because of the use of automobiles, trucks and tractors farmers paid large amounts in gasoline taxes, licence fees, drivers' permits. This bill was estimated to be about \$200,000,000. Sales taxes were in effect in about half the states and the farmers' share was estimated at \$50,000,000.

Mortgage Debts and Interest.—The decline in farm mortgage indebtedness which had been under way since 1922 came to an end in 1945 and the debt began to increase. In 1945, 20 states showed an increase in debt compared with only 8 states the year before. Total farm mortgage debt declined from \$6,586,000,000 in 1940 to \$5,081,000,000 on Jan. 1, 1946. In the first six months of 1946 the total increased \$80,000,000. This gain was in loans by commercial banks, individuals, etc., since the loans by government agencies and life insurance companies continued to decline.

The total liabilities of farmers declined during the same years from \$10,022,000,000 to \$8,337,000,000, which was even more significant. The farm mortgage interest bill declined from \$295,000,000 in 1940 to \$248,000,000 in 1945. This was not so important as the increase in rents paid to landlords not living on farms.

Farm Labour.—The record farm production was achieved in 1946 with a minimum of labour difficulties. In contrast to the situation during the war years the supply of labour was mostly adequate and in some cases requests for help were cancelled by farmers. The return of war veterans was an important factor, some of them returning to farms, others claiming their former

jobs, thereby releasing workers who had come from farms to return to farm work. The total number of persons employed on farms averaged 10,012,000 persons in 1946 compared with 9,844,000 in 1945 and a prewar average of 10,920,000 in 1935-39. The number of family workers averaged about the same through the war years and through 1946, 7,864,000 in 1946; 7,810,000 in 1944 compared with 8,353,000 in 1935-39. The number of hired workers was also smaller during the war and in 1946 than earlier; 2,148,000 in 1946; 2,227,000 in 1944 and 2,568,000 in 1935-39. The more extensive use of power machinery by family workers had replaced the hired help. Shortages of trained dairy and fruit farm workers were reported from many areas, however. Fewer foreign workers were employed in 1946; 58,000 in July 1, 1946, compared with 78,000 foreign workers and 70,000 prisoners of war on July 1, 1945. The prisoners had all been removed from farms by July 1946.

Wage rates for farm labour advanced steadily through the war period and reached new high levels in 1946. Daily wages without board averaged \$1.55 in 1935-39; \$4.39 in Oct. 1945 and \$4.94 in Oct. 1946. Monthly wages without board rose from \$34.90 in 1935-39 to \$95.00 in Oct. 1945 and \$104 in Oct. 1946. The index for all farm wages rose from 118 for 1935-39 to 378 in Oct. 1946 while the level of prices received by farmers for agricultural products rose from 107 to 258. Wage rates were varied more than in earlier years since the use of more farm machinery requires more skill on the part of the farm helper. All controls of farm labour and wages were terminated Nov. 9, 1946, by presidential order.

Efforts to organize farm workers into unions appeared from time to time but no general movement was evident. In the case of highly specialized workers in the fruit industry some organization progress was reported.

Marketing.—Rail transportation shortages and marine shipping strikes were serious handicaps to marketing farm products in 1946. Box cars, refrigerator cars and other railroad equipment were very short of requirements. Motor truck facilities improved steadily. First experiments in air transport of fruits and vegetables were tried on a commercial scale with promise of continuing as rates decline. Supplies of crates of wood and paper were short and both paper and burlap bags were limited in quantity. The packaging of fresh fruits and vegetables at the point of production on a farm to be sold to the consumer was developed on a considerable scale in 1945 and 1946 and was expected to be expanded as packaging materials became available.

The quick freezing processes were expanded rapidly during the year and freezing space in public warehouses as well as cold storage space was scarce.

The farmers' share of the consumers' dollar spent for food reached the high point of 54% average in 1945 and advanced to 55% during the first three months of 1946. Then followed a decline to an average of 53% for the whole year. This compares with a prewar average of 40% in 1935-39 and 46% in the World War I period 1913-15. This estimate is based on the annual food purchases of a family of three average consumers. This market basket cost \$340 per year in 1935-39; \$459 in 1945 and \$500 for the first nine months of 1946. The marketing costs declined during World War II from a prewar average of 59% to an average of 50% in 1945 and 48% in the mid-1946 period. In general terms the prices to farmers advanced faster than retail prices and the distributors' margin remained about the same. This estimate did not take into account that part sold through the black market.

The demand for farm supplies such as lumber and fencing increased rapidly in 1946 as farmers turned to replacing the depleted buildings, fences, etc., that had had little attention during the war period. Lumber was very scarce in many regions. The national supply of lumber in March 1946 was estimated at the very low amount of 875,000,000 bd.ft., compared with 36,500,000,000 bd.ft. production in 1941 before the emergency building began. Even the greatest activity of lumber cutters early in 1946 did not relieve the situation and at the end of the year many lumber yards were entirely without supplies. The simple wire nail became a scarce article. Hay bale wire scarcity prevented many farmers from using their balers. Wooden boxes and baskets for shipping were selling at a premium in many fruit growing regions. Spray materials for pests and plant diseases were available, but at higher prices. Several new insecticides came into use, DDT being one of the most popular. Other new types were used on a small scale and larger production was promised for the next year.

The rapid trend of agriculture to become a highly mechanized industry continued through 1946. Farm machinery production was retarded by strikes and shortage of materials but the output was much larger than during the war years as war industries reconverted. Production of farm machinery during the last half of 1945 and first quarter of 1946 was less than in the same period a year earlier. Some of the labour difficulties had not been settled by the end of 1946. Many new types of machines appeared and found ready buyers, since farmers had ready capital. The principal trend was toward somewhat smaller machines

FARMER DEMONSTRATING A JEEP fitted with new hydraulic lift which was announced in Aug. 1946, and which increases the manoeuvrability of the jeep as a farm implement; here he has raised a spring-tooth field cultivator and is ready to move to another location

sulted to the average-sized family farm. Designs were revised to adapt them to operation by one man, since the average U.S. farm has only one and a half men for general operation.

Fertilizers.—The general increase in average yields after 1940 was partly caused by the use of more commercial fertilizers. Consumption in 1946 was estimated to be about 13,500,000 tons compared with 13,202,000 tons used in 1945 and a prewar average, 1935-39, of 7,270,000 tons. Compared with prewar the amount of nitrogen was doubled but the demand was not satisfied. The use of commercial fertilizers was increasing more rapidly in areas that formerly used little fertilizer, such as the corn belt. The price of fertilizer was more favourable to farmers in 1945 and 1946, in that in terms of plant nutrients the farmer's dollar would buy more than at any previous time in history. Prices were lower near the point of production and distant states were using the more concentrated forms to reduce freight costs. Exports were restricted toward the end of the year to make more plant food available to U.S. farmers, although large amounts were shipped to increase food production in Great Britain, Europe and North Africa. Production was being expanded as rapidly as new plants could be built. Detailed reports of the use of fertilizers on cotton indicated that 1,479,000 tons were used in 1946, which is about the same as was used in 1935-44. But the 1946 supply was used on 8,776,000 ac. while the prewar supply was used on 10,343,000 ac. Therefore the average per ac. in 1946 was 337 lb. compared with 286 lb. in 1935-44.

Agricultural Policies.—Under the Agriculture Adjustment act of 1938 and the Steagall amendment of 1941 the prices of basic crops, corn, cotton, wheat, rice, tobacco and peanuts for nuts were supported at 90% of parity (cotton 92½%). This act was to be in force for two years after the Jan. 1 following the date of the official end of the war or to Jan. 1, 1950. The total cost of price-supporting measures in the form of government payments was \$687,056,000 in 1945 compared with \$715,161,000 in 1944 and \$590,339,000 in 1943. The total for 1946 was expected to be about the same as that of 1945. Changes in legislation by congress were few, the principal adjustments being in regulations under the Price Control act.

Representatives of the leading farm organizations representing about 4,000,000 farm families met in October and jointly proposed revision of the parity formula to include farm labour costs as a factor and to establish a better base than the 1910-14 being used. The secretary of agriculture proposed to congress that the basic government policies be reconsidered.

The principal action by congress was the passage of the Market Research act, authorizing an appropriation of \$9,500,000 the first year, increasing to \$60,000,000 the fifth year, for research in new uses for farm products and improved marketing facilities and services. This bill was strongly supported by organized farmers as one method of solving the problem of agricultural surpluses. The appropriations were left to be made by the 80th congress in 1947. An 11-man advisory committee was appointed to assist the U.S. department of agriculture in choosing projects to be investigated. Another act of importance was one which consolidated several agencies, including the Farm Security administration, into a new agency called the Farmer's Home administration. Several forms of loans to farmers for seeds, drought aid and loans to needy farmers to establish themselves on the land were included.

World Farmers' Organization.—A conference was held in London May 20, 1946, to organize the International Federation of Agricultural Producers. The idea had been proposed at Quebec, Can., in 1945 by the National Farmers' Union of Britain. It was agreed to include only national organizations that are completely independent of governments, the latter being represented by the Food and Agriculture Organization. Thirteen nations qualified for membership under these conditions. A constitution was agreed upon for one year, which was to be submitted to the various organizations for ratification and final adoption or change at a 1947 conference of farm organizations. Four U.S. organizations participated in the conference at London: the National Grange, Farmer's union, American Farm Bureau federation and National Council of Farmers' Cooperatives. These four organizations each had one-fourth of the U.S. vote in the world organization.

A *World Agricultural Census* was organized by the economic and statistics division of the United Nations Food and Agriculture organization in Nov. 1946, to co-ordinate the census work of all nations along lines begun by the International Institute of Agriculture in 1930 and 1940. The latter published the results of the first census in 1930 but the war intervened to interrupt the 1940 survey. Committees were preparing plans at the year's end to make the world's agricultural statistics comparable and more complete.

The International Institute of Agriculture, which had operated from its headquarters at Rome, Italy, from 1904, formally dissolved at a general assembly in July 1946 and its work was absorbed by F.A.O., which arranged to employ some members of the staff and to retire others on pensions. The member countries of the institute were asked to pay their quotas for the war years to provide funds to liquidate the institute's obligations. The Italian government offered the buildings of the institute at Rome for the use of F.A.O. as a branch. The extensive agricultural library and archives were to remain at Rome until the location of a branch for F.A.O. in Europe had been decided. (See also AGRICULTURAL RESEARCH ADMINISTRATION; CENSUS DATA, 1946; CHEMISTRY; FAMINES; FERTILIZERS; HORTICULTURE; IRRIGATION; LAW; LIVESTOCK; METEOROLOGY; PRICE ADMINISTRATION, OFFICE OF; PRICES; SOIL EROSION AND SOIL CONSERVATION; VEGETABLES, etc.; also under principal crops.) (J. C. Ms.)

Great Britain.—The world cereal position necessitated a sharp reversal of the 1945 policy of a gradual return to peacetime conditions. In May 1946 the livestock feeding stuffs rations were reduced, the cut for pigs and poultry bringing their new rations below even wartime levels. This halted any expan-

sion of the livestock industry although there was a slight increase in the numbers of dairy cattle. The number of sheep rose to 12,819,000. Pigs fell in number by 256,000. The cereal area for England and Wales dropped by a further 326,000 ac. The acreage of potatoes and sugar beets rose by 27,000 and 20,000 ac. respectively. Horticultural crops were increased by 42,000 ac. During the year a further 363,000 ac. were put down to grass.

There was an increase in the total agricultural labour force but prisoner-of-war labour continued to supply a substantial proportion of the manpower in farming. In July the national minimum wage was raised from 70s. to 80s. per week. In Dec. the Agricultural Wages (Regulation) bill was introduced to transfer permanently to the Central Agricultural Wages board the wage-fixing powers of the local wages committees.

Agricultural prices were governed by the "Feb. review" made by the minister of agriculture and the National Farmers' unions. The announcement of prices made in March 1946 showed a general upward trend; these prices were to become operative in the 1947 harvest for cereals; from July 1, 1946, for livestock and from April 1 for milk. Compulsory cropping orders for wheat were to be reintroduced for the 1947 crop. The feeding stuffs rations reduction and the wage increase induced a special price review in July. Cereal, potato and sugar beet prices were raised for the 1946 harvest and a further general price increase for arable and livestock products for the 1947 season was announced. As a wheat acreage of at least 2,500,000 ac. was required, wheat prices were to be raised to an over-all average of 20s. 9d. per cwt. The tentative emphasis upon livestock production made in 1945 was reversed. In Oct. 1946 the War Agriculture Executive committees were reconstituted as county executive committees, when the National Agricultural Advisory service came into operation. In Nov. the Hill Farming act was passed, under which financial assistance for farm improvement was to be given to owners and tenants of hill farms.

Weather conditions were generally unfavourable to agriculture throughout the year. Spring cultivations were delayed by rain. Rain and lack of sunshine hampered haymaking. Yields of hay were above the decennial average but not of good quality. The yield and quality of cereal crops suffered considerably from the deplorable harvest weather. The yields of wheat, barley, oats and potatoes were below the decennial averages. Sugar beet yields, however, were above average and the sugar content was good despite lack of sunshine. Other root crops also showed yields above average.

Air Conditioning. Toward the close of 1946 it was apparent that production of air conditioning equipment for the year would exceed that in 1940 despite serious shortages of materials and components, particularly iron castings, copper, sheet steel, electric motors and controls, and despite problems of reconversion from wartime to peacetime manufacture. These problems and shortages were the result of several factors including reconversion problems of producers, price ceilings which diverted materials into more profitable channels and extensive strikes in all of the major industries.

Statistics of domestic and export shipments of air conditioning equipment are published by the U.S. bureau of the census. However, the releases as of Dec. 1946 covered only the calendar year of 1945. A comparison of shipments in 1945 with the prewar year of 1940 for several types of air conditioning products, and estimates of shipments in 1946 from industry sources, follow.

Room air conditioner shipments in 1945 were 1,126 billed at manufacturers' price of \$326,395, as contrasted with shipments in 1940 of 30,873 priced at \$4,584,406. In the first eight months of 1946 shipments were approximately four times the 1940 rate; however, it seemed doubtful that the industry would attain a level more than one-quarter or one-third the units shipped in 1940.

Self-contained air conditioners of the commercial type were used extensively during World War II for essential industrial and commercial applications, and for use in army hospitals. With the momentum thus gained shipments in 1945 were more than double those in 1940 with indications that shipments in 1946 might triple the prewar level. Shipments in 1945 were 13,847 at manufacturers' price of \$10,903,473 as contrasted with 1940 shipments of 5,880 priced at \$4,466,926.

Air conditioned coolers of the remote type in 1945 amounted to approximately half of the shipments in 1940. Shipments in 1945 were 2,850 at \$1,484,971, whereas in 1940 they were 5,955 units at \$2,269,210.

Air conditioning equipment also includes reciprocating and centrifugal condensing units, evaporative condensers, cooling towers, air washers, heat transfer surface and other devices. Statistics for these products do not differentiate between air conditioning and commercial refrigeration application. It can be stated, however, that the volume of sales in 1945 with both of these applications exceeded shipments in 1940 with indications that 1946 would be substantially higher.

Refinements in the design of products were made in 1946 but for the most part they were similar to those produced in the prewar period.

Applications, of course, changed in character. During the war air conditioning was used extensively in mobile units and on ships, in testing laboratories, in industrial plants for increased production and quality control, in hospitals and in many other ways. During 1946 there were still many industrial applications in testing laboratories, in precision manufacture and in the manufacture and processing of hygroscopic materials, but in addition many systems were being planned for the comfort and health of occupants in locations such as hotels, office buildings, retail stores and apartments. Airports and Flying Fields. On May 13, 1946, the Federal Airport act, public law 377, 79th congress, chapter 251, 2nd session, was approved by the president. This action by the federal government was the outstanding development affecting airports and airfields in 1946.

The Federal Airport act authorizes annual appropriations for the construction or improvement of public airports amounting in the aggregate to \$500,000,000. The appropriation in any one year may not exceed \$100,000,000. Of the funds appropriated under this authorizing legislation 5% was to be retained by the Civil Aeronautics administration for the expense of planning and administering the airport construction program. The remaining 95% was to be divided into two parts: one amounting to three-fourths of the 95% was to be apportioned among the states in proportion to their area and population, and the other part amounting to one-fourth of the 95% was to comprise a discretionary fund which was to be allotted to those specific projects which the administrator of CAA deemed most appropriate

for carrying out the national airport plan. The act further authorizes appropriations totalling \$20,000,000 for airport work in Alaska, Hawaii and Puerto Rico of which 50% was to be used in Alaska and 25% each in Hawaii and Puerto Rico. Some states had also appropriated funds with which to assist public sponsors in the state in meeting the basic federal participation ratio of 50%-58%.

In general, the act authorizes the use of appropriated funds for land and easements in air space, airport construction including the removal of hazards and the construction of airport buildings except hangars. Other provisions set the proportion of federal participation in the various items of work, classes of projects and locations of the projects. Projects which embrace work sufficient to bring an airport to CAA class 4 or better must be submitted to the congress for approval at the time the appropriation for funds to do the work is being considered. The selection and approval of projects for airports CAA class 3 or below is left to the CAA.

For planning and statistical purposes, the Civil Aeronautics administration classifies airports according to the effective length of the area available for take-off or landing. Class 1 airports must have, at sea level, a usable landing strip of from 1,800 ft. to 2,499 ft. in length; class 2 from 2,500 ft. to 3,499 ft.; class 3 from 3,500 ft. to 4,499 ft.; and class 4 from 4,500 ft. upwards. The existence or absence of other facilities, such as paved runways, night lights, radio, hangars and fuelling equipment does not affect the classification. There follows a comparison of the number of airports in the U.S. by classification for the periods indicated.

	Dec. 1, 1942	Dec. 1, 1943	Dec. 1, 1944	Dec. 1, 1945	Dec. 1, 1946
Class 1. . . .	1,593	923	1,170	1,550	1,905
Class 2. . . .	688	786	917	1,054	1,249
Class 3. . . .	306	418	463	479	485
Class 4. . . .	199	561	799	834	859
Total. . . .	2,786	2,688	3,349	3,917	4,498

Airports are also grouped under types of ownership or control and the ratios for the various groups are as follows:

ROADBED of the "Electropult," a new plane launcher designed by Westinghouse Electric Corp. for the U.S. navy, and announced in 1946, showing a jet fighter plane preparing to take off. The Electropult is fundamentally a linear electric motor which delivers power in a straight line instead of in the conventional rotating pattern. This plane is sped down the quarter-mile roadbed by its own engines and the Electropult, and into the air at 116 m.p.h. in four seconds

	Dec. 1, 1943	Dec. 1, 1944	Dec. 1, 1945	Dec. 1, 1946
Municipal, commercial and private	66.6%	62.1%	68.6%	76.0%
Armed services	22.3	29.8	23.6	17.4
Other federal	11.1	8.1	7.8	6.6
	100.0%	100.0%	100.0%	100.0%

These totals indicate that the trend toward the establishment of small airports begun toward the end of World War II continued through 1946. For the most part however these new airports were located in the smaller towns and cities. The establishment of adequate airports for personal flying in the major centres of population was still being retarded by opposition on the part of property owners, lack of capital on the part of airport owners and general apathy on the part of municipal officials to recognize the future need for these facilities.

Scheduled and nonscheduled air transport operations taxed the good weather capacity of many of the major airports serving the larger cities during 1946 and this volume of operations caused serious delays and trip cancellations when instrument approaches were required.

Improvement programs were contemplated for most of the airports used by the air carriers which were expected to result in a substantial increase in capacity for aircraft movements under contact flight conditions, and co-ordinated research was continued during the year with a view toward adapting many of the wartime aids to flight to civil use.

Included in this over-all program of increasing airport instrument landing capacities was the actual installation at 52 airports by the CAA of its Instrument Landing System. This system was developed and ready for use prior to World War II but its civil use was delayed because of the need for the equipment for war use. (J. B. Bd.)

Great Britain, Commonwealth and Europe.—The start of civil flying at the beginning of 1946 placed a great strain on the facilities and accommodation available at the airports and aerodromes freed for civil aviation use. In Europe, excluding Great Britain, all the aerodromes had been so heavily bombed by the Allied air forces that a tremendous amount of clearing and temporary repairs had to be effected before they could be used. The damage at such aerodromes as Amsterdam, Brussels, Le Bourget, Orly (Paris) and Bordeaux was tremendous; in some places the wrecked hangars with the damaged German aircraft in them were still as they had been after the bombardment. Repair work went on incessantly, however, and all were handling an ever-increasing volume of air traffic in 1946. In Great Britain there were in Oct. 1946, 94 aerodromes available for civil use, but more were needed to handle the scheduled air services and the charter flying, which had grown at an astonishing rate; there were more than 70 charter companies alone.

On the aerodromes of the capital cities of Great Britain, France, Belgium, the Netherlands, Sweden, Portugal and other countries long permanent runways suitable for non-visibility flying were being laid down and all the radio and radar aids for these purposes were being installed; great blocks of buildings to contain all the offices and passenger accommodation were being planned and erected.

In Africa a large airport was being built in 1946 at Durban where three hard runways, one of 6,600 ft. and two others of 5,280 ft., were being laid down. To do this the river Noulaas was diverted three miles. Another big aerodrome at Livingstone, Northern Rhodesia, was being prepared at a cost of £250,000.

In Australia, the Melbourne airport at Essendon was being developed and enlarged to provide hard runways of 6,100 and 4,800 ft. The aerodrome buildings were to cover an area of 100 ac. At Sydney's Mascot aerodrome similar developments were taking place which were estimated to take five years to complete at a cost of £6,000,000. The longest runway was to

be 10,000 ft. in length. Here again, the Cook river had to be diverted.

In New Zealand, India and the middle east many of the wartime aerodromes were being developed to cope with the increasing civil air traffic. Many millions of pounds were to be spent in the Malay peninsula on aerodromes.

In Canada, aerodrome development could take place without fear of air attack, so that the aerodromes which were built for war were transferred wherever necessary to peacetime civil uses. (See also AVIATION, CIVIL; AVIATION, MILITARY.)

(H. R. G.)

Air Races. After five years of World War II hiatus air races came back into their own in 1946 with the 14th annual All-American air meet at Miami, Fla., with the feature event of the meet, the Glenn Curtiss Trophy race, won by Woody Edmondson of Lynchburg, Va.

Another of the top events of the air year was the Cleveland air races which was also a postwar revival. The significant observation was that the four years' lapse produced a speed factor in planes which in 1941 would have been almost incredible. For example, the Thompson Trophy race, a highlight at Cleveland, produced speeds doubling those of four years before. Fast fighter planes dominated both the Thompson and Bendix trophy events.

Paul Mantz, Burbank, Calif., won the Bendix trophy race with an average speed of 435.604 m.p.h. for the 2,048 mi. from California to Cleveland. His time was 153 m.p.h. faster than the mark posted by Frank Fuller in 1939.

William E. Eddy of La Jolla, Calif., placed second and third place went to Jacqueline Cochran, the only woman in the race. Mantz flew most of the way at 30,000 feet altitude. All flew North American P51 Mustangs with the winner going nonstop.

The jet section of the Bendix race was won by Col. Leon Gray of Casa Grande, Ariz., averaging 493.521 m.p.h.

Cleveland also provided a new event for the women fliers—the Halle Trophy race. A former WASP, Margaret Hurlbert of Painesville, O., captured the 75-mi. event with an average speed of 200.588 m.p.h. Jane Page of Chicago was second with a rating of 200.4 m.p.h.

Alvin (Tex) Johnston was the winner of the Thompson Trophy race carrying a purse of \$19,200. His average speed was 373.908—more than 90 m.p.h. faster than the mark set by Roscoe Turner in 1938. Second man home was Anthony W. LeVier and third was Earl Ortman. (T. J. D.)

Air Transport Command. During 1946 the air transport command of the U.S. army air forces, although greatly decreased in personnel and equipment, was expanded considerably in composition and duties by the inclusion of the airways and air communications service, air weather service, air rescue service, flight service and the aeronautical chart service. This move was part of the over-all picture of consolidation, reduction and retrenchment. The ATC, which at its peak numbered more than 3,000 transport aircraft and more than 250,000 personnel, was by the end of 1946 reduced to 649 transport planes and about 60,000 personnel. Its route mileage decreased from a peak of 184,000 to 71,000 mi.

Despite reductions in personnel and budget allowances, an increase of 9% in the utilization of available ton miles was registered during the first nine months of 1946 over the same period in 1945.

ATC's primary operational function, military air transportation, is conducted by its three divisions—Atlantic, Pacific and European. Because of the severe shortage of technically skilled military personnel certain of ATC's overseas routes were con-

tracted to civilian air lines under jurisdiction of these divisions.

U.S. forces in Japan were supplied during 1946 by three flights per day to Tokyo, flown by the Pacific division. The division headquarters at Hickam field, Honolulu, controlled additional supporting flights from the ATC port of aerial embarkation at Fairfield-Suisun, Calif., to Guam, Johnston Island, Kwajalien, Manila, Shanghai and Peiping. Flights to U.S. bases in Alaska from the U.S. were also maintained by the Pacific division.

From Atlantic division headquarters at Fort Totten, N.Y., two flights daily were routed to Europe with additional missions to Newfoundland, Labrador, Greenland and the Azores. Air transport requirements for U.S. troops in Atkinson, Panamá and Puerto Rico were also met by the Atlantic division.

Within the continental U.S., the Atlantic division operated scheduled routes connecting the ports of aerial embarkation with the major army and air force depots.

The Allied services conduct other flights in support of their functions, *i.e.*, air weather service maintains long-range weather reconnaissance flights, air rescue service operates amphibious and helicopter craft, etc.

In September, Lt. Gen. Harold L. George was appointed to the military staff of United Nations, and was succeeded as ATC commander by Major General Robert M. Webster, formerly commander of ATC's European division and previously commander of the 1st tactical air force in Europe.

The mobility and versatility of the air transport command was demonstrated in May when it was called upon to assist in relieving the national emergency resulting from the short but serious national rail strike. With only four days advance notice, ATC mobilized 1,000 planes, quadrupled all domestic schedules and plotted routes to 60 key cities where liaison officers were placed. Operations lasted only 48 hours and the full potentiality of the command was never reached, but in that short time thousands of pounds of priority mail, passengers and cargo were air-lifted.

For "Operations Crossroads," the atomic bomb tests, ATC flew more than 2,000 passengers and 680 tons of supplies to Kwajalien Island, operations base for the experiment.

In Sept. 1946, ATC's daily operations averaged 148,000 plane-miles, 860 passengers and 467,000 ton-miles. Air evacuation was averaging 1,000 patients per month.

From Jan. to Sept. 1946, ATC flew 48,000 tons 116,112,169 ton-miles; 305,427 passengers were carried more than 918,810,000 passenger miles.

The primary mission of the ATC is to train and provide a nucleus of personnel and equipment necessary to meet strategic air transport requirements in the event of a national emergency. In fulfilling this mission, the ATC is employed in its secondary mission—providing air lift to the armed forces of the United States wherever stationed. (R. M. W.)

A.L.A.: see AMERICAN LIBRARY ASSOCIATION.

Ala, Hussein (1884–), Iranian diplomat, was educated at Westminster school and at the University of London. After completing his studies, he was admitted to the bar at Inner temple. Later, he joined Iran's foreign service and attended the Paris peace conference in 1919. He was joint managing director of the Iranian National bank (1933–34) and Iran's minister to Great Britain (1934–36). Ala was governor of the Iranian National bank in 1941 and the following year he was appointed a minister at the Iranian court.

In Nov. 1945, he was assigned to Washington as Iranian ambassador and was concurrently Iran's delegate to the United Nations. He figured prominently in the Russo-Iranian dispute be-

fore the United Nations Security council in the spring of 1946. On March 19, 1946, Ala formally protested to the council against continued presence of soviet troops in Iran in violation of the March 2 deadline for their withdrawal.

In his subsequent appearances before the council, Ala either contradicted or was contradicted by his government. Despite this bewildering conflict between Ala and the Tehran government, the latter did not request his recall.

On several occasions, Ala was criticized by the president of the Security council for giving the council unauthorized reports. Specifically, on May 22, he was called to task by Alexandre Parodi, president of the council, for issuing, without orders from his government, reports (later contradicted by Premier Ghavam) asserting that "soviet interference" in Iran had not ceased. Ala replied that he put forward the real facts before the council and inferred that the government's communications with him were frequently tardy and contradictory.

On May 29, the Iranian embassy in Washington disclosed that Premier Ghavam had issued a final order to Ala to cease making statements before the U.N.

Alabama. Alabama, located in the east south central division of the United States, commonly called the "Cotton State," was admitted to the union Dec. 14, 1819, as the 22nd state. Area: 51,609 sq.mi.—51,078 mi. of land and 531 mi. of water. The population in 1940 was 2,832,961; the 1944 estimate, 2,818,083. Of the 1940 population there were: 1,849,097 whites, 983,290 Negroes and 574 other persons; 2,821,004 native-born and 11,957 foreign-born. In 1940, 30.2% of the population was urban; 69.8%, rural. The capital city, Montgomery, in 1940 had a population of 78,084. The chief other cities were Birmingham (1940 pop. 267,583) and Mobile (78,720).

History.—Incumbents of principal elective offices of the state government were: Chauncey Sparks, governor; Handy Ellis, lieutenant-governor; William N. McQueen, attorney general; John Brandon, state auditor; Joe N. Poole, commissioner of agriculture and industries; Gordon Persons, chairman, public service commission; Sibyl Pool, secretary of state; Walter C. Lusk, state treasurer; Elbert B. Norton, state superintendent of education. Elected to principal elective offices, with terms beginning in Jan. 1947, were: James E. Folsom, governor; J. Clarence Inzer, lieutenant-governor; Albert A. Carmichael, attorney general; Dan Thomas, state auditor; Haygood Paterson, commissioner of agriculture and industries; Sibyl Pool, secretary of state; John Brandon, state treasurer; Austin R. Meadows, state superintendent of education. Nine amendments to the state constitution were ratified by the people.

Education.—During the academic year 1945–46 (ending June 30), there were 3,785 public schools which enrolled elementary students and 1,927 which enrolled secondary students; 1,798 of these schools were attended by both elementary and secondary pupils; therefore, the net total of separate public elementary and secondary schools was 2,116. There were 12,469 elementary and 7,135 secondary teaching positions in the public schools. Enrolment was 439,365 in the public elementary grades and 204,520 in the secondary grades. State institutions of higher learning in 1946 were as follows: the University of Alabama, Alabama Polytechnic institute, Alabama college, Agricultural and Mechanical institute (Negroes), Florence State Teachers college, Jacksonville State Teachers college, Troy State Teachers college, Livingston State Teachers college, Montgomery State Teachers college (Negroes).

Social Insurance and Assistance, Public Welfare and Related Programs.—Amounts spent for public assistance categories in Alabama during the fiscal year 1945–46 (ending Sept.

30) and the number of recipients (in parentheses) during Sept. 1946 were as follows: old-age assistance \$7,323,844 (39,250); aid to the blind \$169,581 (876); aid to dependent children \$2,044,573 (6,921); aid to children in foster care \$130,819 (353); aid to the handicapped \$646,310 (4,139); temporary aid \$35,830 (157). During the fiscal year 1945-46 unemployment compensation payments were \$17,903,637 to an estimated total of 88,000 beneficiaries. Legislative 1945-46 fiscal year appropriations to the several state correctional agencies, which are substantially self-supporting, and their inmate populations (in parentheses) on Nov. 30, 1946, were: department of corrections and institutions \$471,000 (3,923); Alabama Boys' Industrial school \$145,000 (203); State Training School for Girls \$70,000 (133); Alabama Reform School for Juvenile Negro Lawbreakers \$50,000 (379).

Communications.—Highways and roads consisted of 7,305 mi. in the State system, 53,125 mi. in county systems and between 4,000 and 4,500 mi. in municipal systems. State government expenditures for the purpose of highways, excluding highway debt service amounting to \$2,795,938, were \$13,460,747 during the fiscal year 1945-46. Miles of railroad tracks were approximately 7,800.

Banking and Finance.—On June 30, 1946, there were in Alabama: 153 state banks and 1 branch, which had total deposits of \$397,629,653 and total assets of \$420,406,727; 66 national banks and 20 branches, which had total deposits of approximately \$838,601,000 and total assets of approximately \$888,587,000. On Jan. 1, 1946, there were: 8 state savings and loan associations, which had free shares of \$3,462,147 and total assets of \$4,094,118; 17 national savings and loan associations, which had free shares of \$20,450,152 and total assets of \$22,226,711. According to best available estimates (which exclude resources of state higher education, insane and a few other institutions and the state docks system), total net state government receipts in the fiscal year 1945-46 were \$114,207,102; total net disbursements during that period were \$111,547,040; state bonded indebtedness on Sept. 30, 1946, was \$44,430,000; cash and investment balances on the same date were \$79,923,708.

Agriculture.—The value of Alabama's crop production in 1946 was \$329,828,000. A total of 6,398,000 ac. was harvested. Cash income from sale of crops, livestock and livestock products for 1945 was \$258,998,000; the value of home consumption of crops, livestock and livestock products was \$100,762,000; income from government payments was \$9,536,000. The 1946

JAMES E. FOLSOM, Democrat, was elected governor of Alabama on Nov. 5, 1946

season was favourable for most crops, although not so favourable as 1945, with a particular abundance of moisture in the fall months.

Manufacturing.—The total estimated value of manufactures in Alabama in 1939 was \$574,670,690. The 2,095 manufacturing establishments working 8 or more persons in 1945 had an average of 220,566 employees, to whom they paid wages of \$419,252,627.

Table II.—Principal Industries of Alabama, 1939 and 1937

Industry	Value of Products	
	1939	1937
Cotton broad woven goods	\$75,044,582	\$93,390,182
Blast furnace products	37,085,389	39,629,075
Sawmills, veneer mills, cooperage mills, stock mills, lumber and timber products, etc.	32,512,574	31,915,650
Cast iron pipe and fittings	30,662,008	28,104,450
Oven coke and coke oven by-products	20,138,932	23,579,609
Cotton yarn and thread	14,077,102	17,183,094
Meat packing, wholesale	11,239,523	8,852,612
Cottonseed oil, cake, meal and linters	10,756,520	19,681,409
Fertilizers	9,453,063	8,871,151

Minerals.—The value of Alabama mineral production in

Table III.—Principal Mineral Products of Alabama, 1943 and 1941

Mineral	Value, 1943	Value, 1941
Coal	\$58,575,000	\$41,985,942
Iron Ore	21,047,231	18,090,992
Cement	10,943,926	11,142,649
Stone	3,178,908	3,745,651

1944 was \$108,460,000; in 1943 the value was \$102,013,000.

(C. Ss.)

Alaska. Alaska is one of the two incorporated territories of the United States. The territory lies between the meridians of 130° W. and 173° E. longitude and between the parallels of 51° and 72° N. latitude. It has an area of 586,400 sq.mi. (land, 571,065 sq.mi.) and a civilian population of 72,524 (1939 census). The capital is Juneau, with a population of 5,729; other chief cities are Ketchikan, population 4,695; Nome, 1,559; Anchorage, 3,495; and Fairbanks, 3,455.

Alaska suffered economic setbacks in 1946 because of a paralyzing shipping strike on the west coast which tied up ships in the Alaska trade for 127 days between April 1 and Dec. 8. Emergency food shipments coming into the territory by air sent prices soaring to heights where butter retailed at \$1 a pound and up, meat at \$1.50 a pound and eggs at \$1.35 a dozen. Other commodities' prices were at similar levels at the end of the year. Though the shipping strike was ended in December, shipping concerns still faced the problem of trying to do business without sufficient ships. One company with a fleet of 22 ships in the Alaska trade at the beginning of World War II found itself with only 8 vessels when the war ended. Two other companies had only one ship each. Congressional hearings were held on the Alaska shipping problems in Juneau and Seattle and out of them it was hoped might come improved water transportation to the territory.

Alaska legislature met in special session in 1946, the second of its kind in the territory's legislative history. It enacted into law a liberal veterans' bonus measure and levied a 1% gross revenue tax on business to finance the program. From its enactment in April, the tax had brought in at the end of December approximately \$1,000,000. Under the veterans' law, Alaska veterans of World War II may obtain loans up to \$10,000 at 4% interest to establish businesses, buy homes, farms, fishing boats, etc., or may elect to take a cash bonus of \$10 per month for every month of service. Bonuses can be repaid and loans obtained and when loans are paid new loans may be secured. The legislature also appropriated \$250,000 to carry on a territorial-wide public health program.

Alaska communication system, unit of the U.S. army signal

Table I.—Leading Agricultural Products of Alabama, 1946 and 1945

Crop	1946	1945	Value—1946
Cotton, bales	800,000	931,000	\$136,000,000
Corn, all, bu.	42,005,000	48,081,000	77,709,000
Peanuts, lbs.	262,350,000	340,900,000	23,612,000
Cottonseed, tons	310,000	354,000	20,770,000
Hay, all, tons	780,000	774,000	19,500,000
Sweet potatoes, bu.	5,525,000	5,950,000	12,708,000
Oats, bu.	5,537,000	6,526,000	6,921,000
Potatoes, bu.	4,646,000	4,935,000	6,040,000
Sugar cane sirup, gal.	2,430,000	2,860,000	4,860,000
Peaches, bu.	1,575,000	2,440,000	4,174,000

corps, established the first land-line telephone connection between interior Alaska and the southeast panhandle during the year. As the result of a cable being laid from Juneau to Skagway, there to connect with the telephone line established by the army during the war, it was possible to talk by telephone from Juneau, the capital, to Fairbanks, Anchorage and other points as well as to continental United States via the line flanking the Alaska military highway across Canada which was built during the war.

Fishing, the territory's largest industry, slumped in 1946. The salmon pack fell to 4,000,000 cases as compared with the average annual pack of between 5,000,000 and 6,000,000 cases. The price, however, was high, canned salmon selling as high as \$24 per case.

Exploration for oil, started by the navy during World War II, continued in the Arctic naval reserve under private contract. Wells were driven in the region about 100 mi. south of Point Barrow.

Nome was the disaster town of the year. This mining town on the Bering sea coast twice was struck by terrific storms. A large part of its business district was damaged and losses were around \$500,000.

An extensive program of constructing permanent bases in Alaska was started by the army in 1946. Millions were spent at Ladd field near Fairbanks, Elmendorf field near Anchorage and at points in the Aleutian chain. Thousands of workers were employed but housing was such a serious problem that the army was forced to build its own houses to accommodate the construction workers. Throughout the territory housing of any kind was at premium and building was slow because of lack of material.

Territorial bank balance at the end of the year was \$1,076,000. Alaska has no public debt. (L. M. W.)

Alaska Highway: *see* ROADS AND HIGHWAYS.

Albania. Albania, a people's republic in the western part of the Balkan peninsula, along the Adriatic shore. Area 10,629 sq.mi.; pop. (census 1930) 1,003,124; (est. 1939) 1,063,000. Capital, Tirana. Chief cities (1930 census): Tirana (30,806); Scutari (29,209); Koritsa (22,787); Elbasan (13,796), Valona (9,100). Religion: Mohammedans (688,280); Orthodox Christians (210,313); Roman Catholics (104,184). Premier in 1946: Enver Hoxha.

History.—On Nov. 10, 1945, the Big Three recognized the cabinet of Enver Hoxha conditionally as the provisional government, and elections held in the following month brought the expected victory at the polls. The government suppressed all opposition, and openly followed the path shown by the soviet government in the U.S.S.R. and by Tito's government in Yugoslavia.

The social and economic backwardness of the small but strategically highly important country made complete government control of all cultural and economic life relatively easy. The government was wholly communist dominated. Its three leading personalities were Premier Hoxha, the minister of information, M. Maleshova who lived in Moscow for 15 years and returned only during World War II to Albania and Kodji Xoxe, the communist chief of the general staff and president of the special tribunal dealing with "war criminals."

The new government introduced equality for women, broadened the very narrow bases of educational work in the country and began to modernize its economic life. U.N.R.R.A. relief supplies were of great importance in improving the economic situation and the state of public health. The relatively very large army which the regime maintained, however, slowed

U.S. ARMY TRUCK crossing the Drin river in Albania; the truck was one of 297 purchased in 1946 by the U.N.R.R.A. and turned over to the Albanian government, to carry food to the interior of Albania

down economic reconstruction.

As the result of the hostile attitude of the Albanian government to the western democracies, relations between that country on the one hand, and Great Britain and the United States on the other hand, steadily worsened during 1946. The government-controlled press and radio of Albania conducted uninterrupted bitter propaganda against the western democracies.

The country concluded a naval agreement with Yugoslavia on Sept. 10, 1946, and was reported to have heavily fortified, with soviet help, strategic points on the Adriatic coast.

On Nov. 27 Yugoslavia and Albania signed an agreement establishing a customs union between the two countries co-ordinating their economic and financial policies.

On April 6, 1946, Great Britain recalled its military mission after complaining that the Albanian government had restricted unfairly the freedom of movement of the mission and expelled a war graves commission. Britain revoked a decision to send an envoy to Albania and declined to accept an Albanian envoy. The strained relations between the two countries became worse when, as a result of mines laid in the Corfu channel, British warships were damaged. The United States government decided in Nov. 1946 not to recognize the Albanian government and to recall the U.S. diplomatic mission at Tirana. The chief defendant in an Albanian sabotage trial on Nov. 15 was reported as stating that the assistant chief of the withdrawing U.S. mission led a ring of plotters against the regime. On the same day the U.S. mission headed by George D. Henderson left Albania on board a U.S. warship which was not allowed to enter an Albanian port.

While the relations with Yugoslavia became more and more intimate, Albanian relations with Greece grew more and more hostile.

The Greek government complained to the United Nations about troubles fomented allegedly by the Albanian government, in co-operation with the Yugoslav government, along the border.

The Greek government claimed northern Epirus from Albania on ethnographic reasons. (*See also ITALIAN COLONIAL EMPIRE.*)

(H. Ko.)

Alberta. Most westerly of the three prairie provinces of Canada, Alberta was created by parliament in 1905. The area is 255,285 sq.mi., of which 6,485 are water; pop. 796,169 (1941 census), with 489,583 rural, 426,458 male; the 1946 dominion bureau of statistics estimate was 826,000. The largest city is Edmonton, provincial capital (1941: 93,817; 1943: 131,050). Administered by a lieutenant governor, an executive council and a 63-member legislative assembly, Alberta is represented by 17 members of parliament and 6 senators.

History.—Throughout 1946, Social Credit Premier Hon. E. C. Manning continued in office, producing a record surplus of \$10,310,856 for the fiscal year ending March 31. Political interest centred on the legality of the "Alberta Bill of Rights" passed at the spring session of the legislature. On Dec. 17 the Alberta supreme court validated Part I outlining the "rights of citizens to education and security," but invalidated Part II which planned to finance education and security with credit certificates backed by the province's resources. Premier Manning announced he would appeal to the privy council, though from 1935 that body had declared unconstitutional other attempts to practise Social Credit theories.

A nondelivery strike of 50,000 farmers, launched Sept. 7 by the Alberta Farmers' union, lasted several weeks, sought parity between farm costs and returns, but petered out. (C. Cy.)

Education.—In the school session 1943-44, the enrolment of pupils in all educational institutions was 171,940. The total revenue for provincially controlled schools in 1943 was \$11,996,605. The University of Alberta, with its seat at Edmonton, is the provincial university.

Agriculture.—In 1944 the total value of agricultural production was \$420,111,000; farm income, \$314,100,000. For 1945 the wheat crop was 80,000,000 bu. and the oats crop, 76,000,000 bu. The total value of field

crops in 1945 was set tentatively at \$174,622,000. Inspected slaughtering of livestock during the first 50 weeks of 1945 were: cattle 308,538; calves 71,677; hogs 1,434,677; sheep 108,047.

Minerals.—In the period Sept. 1944-Sept. 1945, coal production was 5,617,775 tons (1943-44, 5,240,353 tons). In 1944 oil production was 8,788,276 bbl.

Transportation and Communication.—In 1944 there were 5,682 mi. of railroads and 87,975 telephones. There were 81,094 mi. of highways in 1945.

Alcan (Alaska) Highway: see ROADS AND HIGHWAYS.

Alcohol, Industrial. The total output of industrial alcohol in the U.S. was restricted during 1946 by the shortage of grains, which were needed for relief supplies and feed. Total tax-paid industrial alcohol production was 329,386,000 gal. in the year ending July 1, 1946, compared with 683,431,000 gal. in 1945 and 298,270,000 gal. in 1941, when the war demand began. The rubber industry continued to use petroleum products and the cost of grain alcohol was too high for it to compete with other alcohols. Throughout 1946 grain prices were high and restrictions on the use of grains for alcohol making were severe. The use of wheat for alcohol making was prohibited after March 1, 1946. The amount of wheat used was up to more than 108,000,000 bu. in 1943 but dropped to 21,000,000 bu. in 1945. A part of the latter was used to make alcoholic liquors. The quantities of rice and other grains were also restricted for alcohol making. The government bought large quantities of potatoes to support the market in 1946 and by mid-September had diverted about 30,000,000 bu. to alcohol making. Efforts to increase the use of various agricultural surpluses for alcohol making were continued and some new processes appeared promising.

The Commodity Credit corporation purchased the surplus of blackstrap molasses from Cuba for alcohol making amounting to 115,000,000 gal. in 1946 and 165,000,000 gal. in 1947. The corporation also agreed to buy 10,000,000 gal. of alcohol to be delivered in 1946 and 20,000,000 gal. to be delivered in 1947.

Alekhine, Alexander (1892-1946), French chess champion, was born on Nov. 1 in Moscow. He fled from Russia after the revolution, and became a naturalized Frenchman in 1927. Rated one of the world's greatest chess players, he won the world championship from J. R. Capablanca in 1927, lost it in 1935 to Dr. Max Euwe, but regained it from Dr. Euwe in 1937. In the 1938 A.V.R.O. tournament in the Netherlands, he finished fourth, but came back to win first place in the 1940 Salzburg tournament. He dropped to second place in the 1942 Munich contest. In 1941, two articles bearing Dr. Alekhine's name attacking Jewish chess masters and criticizing the alleged "Jewish influence" on the game were printed in a German language chess magazine distributed on the continent. Dr. Alekhine subsequently asserted that the Germans had twisted his language and had inserted the offensive anti-Semitic utterances. Before his death he had been working on his memoirs and was training to meet the Russian chess champion, Michael Botvinnik, in England. He was found dead in his hotel room in Estoril, Portugal, of a heart ailment on March 24. See *Encyclopædia Britannica*.

Alemán, Miguel (1902-), Mexican statesman, was born in Sayula, Vera Cruz state, the son of a shopkeeper who became a revolutionary general. Graduated in 1928 from the law school of the National University of Mexico, he was admitted to the bar in the same year. Entering politics after a successful legal career climaxed by his appointment as a justice in the federal appeals court, he was elected to

SLUICING POTATOES down a metal trough at the Joseph S. Finch distillery at Schenley, Pa., in 1946, in the process of producing alcohol from them

the senate, but resigned in 1936 to become governor of Vera Cruz state. Four years later, Alemán also resigned from this office to become campaign manager for Gen. Manuel Avila Camacho during the presidential campaign of 1940. Upon his election, Avila Camacho named Alemán as minister of interior and minister of government. During World War II, Alemán was a staunch supporter of the Allies and in June 1945, he began his campaign for the presidency. In the elections, held July 7, 1946, Alemán defeated his opponent, Ezequiel Padilla by an overwhelming margin. Upon his inauguration (Dec. 1, 1946), the new president reassured Mexican workers that they would continue to have state protection, but asserted that his government intended to "maintain the interests of the country above those of individuals or groups."

Aleutian Islands: *see* ALASKA.

Alexander, Albert Victor (1885–), British statesman and politician, was born May 1, in Weston-super-Mare, England. At the age of 18, he worked for the Somerset County Education committee, staying with that organization for 17 years. He joined the army during World War I, rising from the rank of private to that of captain. After the armistice, Alexander became interested in the co-operative movement and was made parliamentary secretary of the Co-operative congress in 1920. In 1922, he was elected to parliament as a Co-operative party candidate.

He was first lord of the admiralty in the MacDonald government, 1929–31, and after losing his seat in the Labourite defeat of 1931, he resumed his association with the Co-operatives. He was elected again to the house of commons in 1935 and in 1940 Churchill renamed Alexander first lord of the admiralty.

After the Labourite victory in July 1945, Alexander again headed the admiralty, this time in the Attlee government. In the summer of 1946, he temporarily replaced Ernest Bevin, who was in ill-health, at the 21-nations peace conference in Paris. Clement Attlee created a ministry of defense on Oct. 4, 1946, appointing Alexander at its head with control of the three armed services—army, navy and air force.

Alexander, Harold Rupert Leofric George,

VISCOUNT, OF TUNIS (1891–), British field marshal and governor-general of Canada, was born on Dec. 10, 1891, the third son of the fourth earl of Caledon. He was educated at Harrow and Sandhurst and took his commission in the Irish guards in 1911; during World War I, when he commanded a battalion of his regiment on the western front, he was twice wounded and received the distinguished service order, military cross and the Legion of Honour.

In 1939 he led the 1st division to France; the final defense and evacuation of Dunkirk was organized by him, and he was among the last to leave the beaches. Between Dec. 1940 and Feb. 1942 as general officer commanding in chief, southern command, he initiated in the battle school the new scheme of training for scientific warfare. At the end of Feb. 1942 he arrived in Burma to extricate the hopelessly outnumbered British army from a campaign already lost. In Aug. 1942 he was sent to the middle east as commander in chief; under his direction the 8th army won the decisive victory of El Alamein and pursued the German and Italian forces to Tobruk, Bengasi, Tripoli and the border of Tunisia. As deputy commander in chief to General Eisenhower and field commander of the British, U.S. and French armies in North Africa, he carried through the Allied offensive which led to the fall of Tunis and the surrender of the axis; as commander of the 15th British, Canadian and U.S. army group

he directed the invasion of Sicily in July and of Italy in Sept. 1943. Under his command the Anglo-American 5th army and the British 8th army fought their way to north Italy. He was made field marshal after the capture of Rome on June 4, 1944, and in December he became supreme commander, Mediterranean theatre; he imposed unconditional surrender on the German southwestern armies in May 1945. In Aug. 1945 he was appointed governor-general of Canada. A viscounty was conferred upon him in the New Year honours of 1946, and on March 10 he was given the freedom of the City of London.

In December he was made Knight of the Garter; as he was unable to attend the investiture, his insignia were sent to him in Canada.

Alfalfa. The 1946 U.S. crop of alfalfa hay was estimated by the U.S. department of agriculture at 31,817,000 tons which was 8% less than the 34,462,000 tons harvested in 1945 but 6% above the 10-year average 1935–44 of 29,886,000 tons. The total acreage harvested was 14,440,000 ac. in 1946, 15,261,000 ac. in 1945 compared with an average of 14,203,000 ac. for the 10 years 1935–44. The average yield was 2.20 tons per acre compared with 2.26 tons in 1945 and an average of 2.10 tons. The crop was below average in a large area extending from Ohio to Minnesota and from Colorado to Oregon. Most states outside of these areas had above-average yields. California reported the high yield of 4.60 tons per acre, mostly from irrigated land, and New Mexico had an average yield of 3 tons per ac. The price of hay advanced during 1946 at a moderate rate. The average price of loose alfalfa hay in Jan. 1946 was \$18.40 per ton for the whole United States and \$20.00 in Nov., ranging from \$10.30 per ton in North Dakota to more than \$30.00 per ton in the Carolinas where the crop was short.

U.S. Production of Alfalfa Hay in Leading States, 1946, 1945 and 10-year Average, 1935–44

			(In thousands of tons)					
State	1946	1945	10-yr. average	State	1946	1945	10-yr. average	
California . . .	4,623	4,309	3,431	Colorado . . .	1,255	1,349	1,271	
Idaho	2,010	1,949	1,885	Illinois	1,200	1,277	1,054	
Minnesota . . .	1,917	1,942	2,386	Montana . . .	1,139	1,290	1,004	
Nebraska . . .	1,786	1,982	1,262	Utah	898	989	971

Wisconsin . . .	1,517	2,112	2,285	Indiana	773	*831	804	
Michigan . . .	1,404	1,907	1,896	New York . . .	695	869	736	

The alfalfa seed crop made a new record of 1,658,400 bu. in 1946, 9% above the record of 1939 and 40% above 1945. The favourable weather permitted a record acreage of 1,070,000 ac. to be harvested which was 40% above the average. The yield averaged 1.55 bu. for the country as a whole, with 3.70 bu. in California, 2.80 bu. in Utah and 2.75 bu. in Texas. Kansas, the leading seed-producing state, averaged 1.50 bu. per ac. Aliens. **Alien Registration.**—All aliens remaining in the U.S. for 29 days or longer are required to register under the provisions of the Alien Registration act of 1940. The initial registration for aliens began on Aug. 27, 1940, and continued through Dec. 26, 1940. During this period, 4,889,770 aliens registered as residents of continental U.S. Factors determining the alien population are net immigration, naturalization and mortality. By using the true figures for immigration and naturalization, and estimating the alien mortality for the period of registration, it is possible to arrive at the approximate alien population. On such a basis it is estimated that there were

approximately 3,000,000 resident aliens in continental U.S. on June 30, 1946. This estimate does not take into account persons there temporarily; that is, nonimmigrants, border crossers and imported labourers.

Naturalization.—Naturalization was granted in the U.S. and overseas to 150,062 persons during the fiscal year ended June 30, 1946. This was a marked decrease from the highest recorded figure of 441,979 naturalizations which occurred in the fiscal year ended June 30, 1944. Of the naturalizations granted in 1946, 134,849 were of civilians. During the year, 6,575 petitions for naturalization were denied; there were 9,782 denied in the fiscal year ended June 30, 1945.

The Second War Powers act, approved March 27, 1942, made available temporarily, an expeditious naturalization procedure to noncitizens serving in the armed forces of the U.S. For the fiscal year ended June 30, 1946, 13,159 members of the military and naval forces residing in the U.S., Alaska, Hawaii, Puerto Rico and the Virgin Islands were admitted to citizenship on the basis of petitions filed with naturalization courts. In addition, a total of 2,054 persons serving abroad with the armed forces of the U.S. were admitted to citizenship by designated representatives of the immigration and naturalization service under the administrative process. Naturalizations were granted in the following areas: Belgium 92; England 77; France 434; Germany 447; Italy 77; other Europe 18; China 49; India 216; Australia 60; Philippine Islands 506; other Pacific 2; all other countries 76. The number of aliens naturalized during the fiscal year 1946, with the principal countries to which such persons owed allegiance, are shown in the table below.

There were 186 naturalizations judicially granted which were revoked during the year, an increase of 21 as compared with the preceding fiscal year. In 162 cases the foreign service of the department of state initiated the action because naturalized citizens of the U.S. became permanent residents of foreign countries within five years after naturalization. In 21 cases the immigration and naturalization service initiated action because naturalization was fraudulently or illegally procured, and in three cases, because the persons were dishonourably discharged, following naturalization under sections 701 and 702 of the nationality act of 1940.

Nationality may be lost involuntarily through commission of treason against the U.S., or by desertion from the military or naval service of the U.S. in time of war, if convicted of the offense, or by departure from or remaining outside the jurisdiction of the U.S. in time of war or national emergency for the purpose of evading or avoiding training and service in the armed forces of the country. Nationality may also be lost voluntarily through the performance of various acts. In the fiscal year ended June 30, 1946, 1,113 persons expatriated themselves.

Petitions for naturalization, exclusive of overseas petitions by members of the armed forces, were filed by 123,864 persons. Declarations of intention filed in the fiscal year 1946 dropped

to 28,787, the lowest number recorded from 1907, which was the first year in which consolidated statistical records of naturalization were made. There were 31,195 declarations filed in the fiscal year 1945, 42,368 in 1944 and 115,664 in 1943.

Alien Enemies.—During the fiscal year 1946 the population of the civilian alien enemy internment camps increased by 4,939 including 61 persons born in the camps. The increase consisted mainly of persons from evacuation centres previously operated by the War Relocation Authority of the Department of Interior. During the same period 10,764 persons departed from the camps—6,224 for repatriation, 280 on parole, 35 for internment at large and 4,201 pursuant to unconditional release; and there were 24 deaths. 1,539 remained in custody at the close of the fiscal year—982 Japanese, 555 Germans, 1 Italian and 1 Hungarian. Of these, 146 (90 Japanese and 56 Germans) had voluntarily joined the interned head of the family; 891 had been apprehended in continental U.S. under presidential warrants; 492 had been brought from other American republics for internment as alien enemies deemed dangerous to the western hemisphere; and 10 had been brought from Hawaii (1) the European or South Pacific theatres of war (8) and from an enemy merchant vessel (1) taken into custody early in the war. Only two civilian internment facilities remained in operation at the close of the fiscal year.

Most of the Japanese who remained in internment had renounced their U.S. citizenship and were being held for repatriation pending the action of the federal courts on questions concerning the legality of their forced removal from the U.S. under the Alien Enemy Act of 1798. Most of the Germans remaining in internment had appealed the action of the attorney general in ordering their removals and their cases were awaiting action by the U.S. supreme court.

New Legislation.—The act of Dec. 29, 1945 (International Organizations Immunity act) authorized the temporary admission of persons designated by foreign governments to serve as their representatives in or to certain international organizations, officers and employees of such organizations, and members of the immediate families of such representatives, officers and employees, and granted them the same privileges, exemptions, and immunities concerning entry into and departure from the U.S., alien registration and fingerprinting, and registration of foreign agents, that are accorded officers and employees, respectively, of foreign governments, and members of their families.

The act of April 30, 1946 (Philippine Trade Act of 1946) provided for the admission to the U.S., as nonquota immigrants, of certain citizens of the Philippine Islands who had actually resided in the U.S. continuously for three years during the period beginning June 1, 1938, and ending Nov. 30, 1941. These benefits also were extended under certain conditions to the wives and unmarried children under 18 of such Philippine citizens. Application for admission under this act had to be made before July 4, 1951.

Another act of April 30, 1946 (Philippine Rehabilitation Act of 1946) provided that until June 30, 1950, a limited number of Filipinos might be admitted to the U.S. temporarily, without regard to the immigration laws except laws relating to alien registration and fingerprinting, for instruction or training under the supervision and at the expense of the U.S. government.

The act of June 29, 1946, authorized the prompt admission to the U.S. for a period of three months, of the alien fiancées or fiancés of citizens of the U.S. who had served honourably or were so serving in the armed forces of the U.S. during World War II. The benefits of the act are conferred only when the alien is not subject to exclusion under the immigration laws, the applicable nonpreference portion of the quota is exhausted and the alien intends in good faith to contract a valid marriage to

*Aliens Naturalized During Year Ended June 30, 1946,
by Countries or Regions of Former Allegiance*

Countries or regions of former allegiance	Total Naturalized	Civilian	Military	
			In U.S. under Sec. 701	Abroad under Sec. 702

Other Countries	29,745	27,572	1,912	261

such U.S. citizen. Application for such admission had to be made before July 2, 1947.

The act of July 2, 1946, provided that Filipino persons or persons of Filipino descent and persons of races indigenous to India shall have the right to become naturalized citizens; exempted certain Filipino persons or persons of Filipino descent from the naturalization requirements relating to declaration of intention and certificate of arrival; and defined the classes of persons to be chargeable to the immigration quotas of India and China.

The act of July 31, 1946, added subdivision (i) to section 201 of the nationality act of 1940. The new subdivision conferred citizenship upon a child born abroad to an alien parent and a citizen parent who had served or was serving honourably in the armed forces of the U.S. during World War II, if the citizen parent had previously resided in the U.S. for 10 years, at least 5 of which were after attaining the age of 12 years.

The act of Aug. 7, 1946 (amending the act of Feb. 27, 1925) increased the powers of officers of the immigration and naturalization service to arrest certain aliens without a warrant and to search vessels, railway cars and other conveyances.

The act of Aug. 7, 1946 (amending section 323 of the nationality act of 1940) provided for the expeditious naturalization prior to Aug. 7, 1947, of former citizens who had lost their citizenship by voting in a political election in a foreign state other than a state at war with the U.S. during World War II.

The act of Aug. 7, 1946 (amending section 2 of the act of Dec. 17, 1943) granted nonquota immigration status to Chinese wives of U.S. citizens. (See also CENSUS DATA, 1946; WAR RELOCATION AUTHORITY.) (U. C.)

Great Britain.—The number of aliens registered with the police by Nov. 1946 was 257,742 (males, 142,531; females, 115,211). The figure at March 31, 1946, was 276,033, and at March 31, 1945, 282,264. The principal nationalities represented were: Austrian, 16,096; Belgian, 10,495; Chinese, 12,862; Czechoslovak, 10,122; Dutch, 12,226; French, 12,781; German, 36,059; Italian, 17,807; Norwegian, 9,398; Polish, 23,276; Russian, 39,426, and American, 13,438. Members of the diplomatic and consular services of foreign governments, members of the British and Allied forces (not being on leave for a period exceeding 16 days) and British-protected persons were exempt from registration. Visitors other than enemy aliens were not required to register unless their stay exceeded two months. By an order of Feb. 9, 1946, women who had lost their British nationality by reason of marriage were exempt from registration; 19,034 registrations were cancelled under this order.

Responsibility for the re-settlement in civil life either in the United Kingdom or elsewhere of members of the Polish forces serving under British command who were unwilling to return to Poland was accepted by the British government. The total number involved was estimated at 170,000. Of these more than 20,000 volunteered to return to Poland, and repatriation proceeded at the rate of 3,000 to 4,000 a month. There were in addition 20,000 dependents to be brought from Italy and elsewhere.

The Aliens order, 1946, reintroduced the prewar requirement, that a foreigner entering the country for employment must be in possession of an employment permit issued to his employer by the ministry of labour and national service. During the first six months following the order 7,601 permits were issued. Of these 5,522 were for domestic servants, 729 for entertainers coming for short engagements and 386 for student employees.

There were approximately 30,000 applications for naturalization and between 40 and 50 applications were lodged daily. The number of new applications for the six months to Sept. 30, 1946, was 8,025, compared with a yearly average of 1,708 before

World War II. The number of certificates granted during the year was 4,170. Special arrangements were made to consider claims for priority either because of service in the British forces or in the merchant navy, or because of the contribution made by the applicant to the war effort or to the economic welfare of the country. The rate of naturalization was officially stated to be 7,000 a year.

During 1946, 257 persons were deported under deportation orders. Twenty-three enemy aliens out of a total of 27,568 interned for precautionary reasons were still interned under the royal prerogative. In two cases legal proceedings were taken to challenge internment and repatriation; the others were hospital cases. (W. B. L.)

Alimentary System, Disorders of. The Oesophagus.

During a recent period of ten years, 44 patients with benign stricture of the oesophagus came under E. B. Benedict's observation. During this same period, 128 patients with carcinoma of the oesophagus were seen by him. Almost all of the former group were more than 50 years of age; hence it was necessary to rule out carcinoma by oesophagoscopy and biopsy. Difficulty in swallowing was the chief symptom of patients with benign stricture. Both benign and malignant diseases of the oesophagus appear to be relatively infrequent in women. Of the 44 patients with benign stricture, 31 were men and 13 women; of the 128 patients with carcinoma, 107 were men. In the series of 44 cases of benign stricture, hiatus hernia also was present in 17 cases, duodenal ulcer was present in 15 cases and oesophageal ulcer was present in 8 cases. Oesophagitis was present invariably.

The treatment recommended consisted of initial bougienage (dilatation with a bougie) through the oesophagus, preceded by the local application of sulfadiazine, a diet consisting exclusively of bland strained foods, and the complete elimination of the use of tobacco and alcohol. This treatment also was supplemented by the use of a bougie or dilator passed over a thread previously swallowed to serve as a guide. The hazard of blind bougienage was emphasized.

The Stomach and Duodenum.—Gastroduodenal ulcer continued important in gastroenterologic medicine, and rightly so because of its prevalence and its unfavourable effect on the comfort, efficiency and risk to life of about 10% of the adult population. Largely on the basis of an increase in admissions to hospitals and personal observations or convictions, the impression prevailed that there had been an actual increase in the incidence of peptic ulcer, and in that of duodenal ulcer in particular. While such might be the case, definitive proof of this was lacking since proof would presuppose an investigation that would include a broad sampling of the general population involving thousands of cases selected from material which had been submitted to intensive study by approved modern methods. Such an obviously extremely difficult study had never been made up to 1947.

Current articles rightly emphasized the importance of keeping an ulcer of the stomach or duodenum healed once successful initial treatment had been accomplished. The need for reliable data on the incidence of recurrences of ulcer following conservative methods of treatment was apparent. Published reports bearing on this phase of the subject, several of them documented with statistical evidence revealed disappointing results. Lately, P. J. Raimondi and M. F. Collen observed that among 151 patients studied for one to two and three-fourths years, approximately 66% had recurrences within a year. Such a large percentage of relapses is probably in great measure the result of inadequate treatment, as well as failure to cultivate the co-operation of the patient properly. One is reminded of Berk-

X-RAY PICTURE showing marbles in alimentary canal of Edward Travis of Peekskill, N.Y., a nine-year old boy who had swallowed them on a dare in May 1946

eley George Moynihan's criticism in 1932; namely, that the failure of medical treatment was attributable to its insufficiency.

Vagotomy in the treatment of chronic refractory ulcer continued to interest physician and surgeon alike. It was somewhat too soon to determine the ultimate effect of this operation, not only on the lesion itself but on eventual gastric form and function, or to be able to predict the future extent to which the operation would be utilized. So far, reports emanating from various authoritative sources were generally favourable and encouraging.

The Pancreas.—Of all the diseases giving rise to abdominal manifestations, those of the pancreas continued to be the most difficult of recognition. This is in large measure due to the inaccessibility of the organ and its secretions to examination, and to the frequent omission of the gland in diagnostic orientation. Current knowledge of the pancreas in health and disease was embodied in a small volume by H. O. Lagerlöf and was considered in an article by M. W. Comfort, E. E. Gambill and A. H. Baggenstoss.

Factors predisposing to inflammatory disease of the pancreas are cholecystitis, alcoholism and duodenal lesions, and, to lesser degree mumps, syphilis and tuberculosis. Acute pancreatitis often is erroneously diagnosed as acute inflammation of the gallbladder, perforating peptic ulcer or acute intestinal obstruction. In cases of acute diseases, absence of objective evidence of disease of the gallbladder, of the upper part of the digestive tract, or of the kidneys presupposes exclusion of the pancreas as the offending organ. An increase of amylase in blood serum or urine is reliable corroborative evidence of pancreatic involvement. Lagerlöf maintained that the acute fulminating forms of pancreatitis frequently may be distinguished from acute cholecystitis by the greater intensity and duration of the pain and by the associated cyanosis, ileus and shock. Involvement of the terminal portion of the organ, or the tail, gives rise to pain in the left side of the upper part of the abdomen. The pain passes straight

through the abdomen or extends around to the back, a circumstance which enables prompt recognition of the true nature of the disorder by the experienced clinician. Lagerlöf described the following four main types: (1) cases with repeated acute attacks and symptom-free intervals, "relapsing pancreatitis"; (2) cases with periodic or continual discomfort in the abdomen, consisting mostly of pain; (3) cases, the main features of which are disorders in the internal or external secretion; (4) cases with no pancreatic symptoms, in which the pancreatic disease is discovered accidentally at operation or at necropsy, or by functional tests.

The contribution by Comfort and his associates is unique and instructive because it is a comprehensive analysis of the clinical and pathologic data in a series of 29 cases of chronic pancreatitis characterized by acute exacerbations from time to time, in the large majority of cases, and without associated disease of the biliary or gastroduodenal tracts of a degree sufficient to influence the clinical picture. The conclusions of these investigators were more or less consonant with those of Lagerlöf, and the authors concluded their article with the following optimistic note: "The diagnosis of chronic relapsing pancreatitis should be made with a high degree of accuracy, because of the highly characteristic clinical picture, including the characteristic painful exacerbations and the disturbances of function of the pancreas demonstrable during and between the acute exacerbations." (From Comfort, Gambill and Baggenstoss, *Gastroenterology*.)

The Intestine.—The small bowel, like the pancreas, is slowly but grudgingly yielding its secrets. However, much remained to be learned. The smallness of a volume by Ross Golden on the roentgenologic examination of this organ attests the lack of knowledge that still persisted. While there is still much to be desired in the roentgenologic examination of the small intestine, progress was made in the detection of such pathologic processes as benign tumours which often give rise to painless melaena, regional ileitis, nutritional disorders, such as sprue, obstructive processes of benign or malignant nature and Meckel's diverticulum.

The successful role of antibiotics in the treatment of disease processes of the colon is apparent. W. E. Palmer and W. L. Ricketts successfully treated three patients with chronic ulcerative colitis who had manifestations of generalized peritonitis by means of combined sulfonamide and penicillin therapy. B. Kirschner reported one case of acute fulminating ulcerative colitis in which treatment with streptomycin proved successful. According to W. H. Hargreaves, penicillin is an effective adjunct to the conventional drugs employed in the treatment of chronic amoebic dysentery.

Allen, Sir Hugh Percy (1869-1946), British musician, was born on Dec. 23 at Reading. A former director of the Royal College of Music (1918-37), Sir Hugh at the time of his death was professor of music at Oxford university, a post he had held for 28 years. He also was president of the Royal College of Organists. He was popu-

larly known to British music lovers as conductor of the London and the Oxford Bach choirs and he had served the British Broadcasting corporation as chairman of the music advisory committee. He died in an Oxford hospital on Feb. 20. See *Encyclopædia Britannica*.

Allergy. During 1946 significant advances were made in the treatment of allergic conditions. First in importance was the recognition of the value of antihistamine drugs. It had long been believed that when the antigen (pollen as an example) encounters the sensitive cells of an allergic individual a substance known as histamine is suddenly liberated, causing the symptoms of allergy. Certain drugs were developed, among which were benadryl and pyribenzamine, which prevented the action of histamine, thus limiting or preventing allergic symptoms. Many investigators contributed to this study during 1946. C. E. Arbesman and his co-workers treated 495 patients with various allergic disorders. Nasal allergy was helped most. Less effective relief occurred in asthma, while only the milder cases of hives responded favourably. S. Friedman and S. M. Feinberg confirmed the effectiveness of the drug in itching skin conditions and in seasonal nasal allergy. All workers emphasized the fact that the effect was palliative and not curative.

Other advances in therapy were reported. D. State and O. H. Wangenstein obtained good results in 10 out of 15 patients with serum sickness by the injection of procaine intravenously. Improvement in the treatment of poison ivy continued to be studied. M. B. Sulzberger, R. L. Baer and A. Kanof reported the successful use of chloramide in ointments for the oxidation and chlorination of the poison ivy toxin. The drug had been used as an antivesicant in the U.S. army. M. B. Strauss and W. C. Spain reported an improvement in the plant extract for immunization purposes by using an aqueous suspension rather than an alcoholic extract of poison ivy.

While these advances in therapy represented positive contributions, the dangers and disadvantages of some measures were likewise reported. The widespread use of penicillin brought out the danger of the development of both general and local sensitivity to this substance. M. H. Kolodny and E. Denhoff found 32 allergic reactions in 124 patients who received penicillin intramuscularly. This high incidence of allergy was attributed to the presence of fungus infections in dermatologic cases. J. A. McGuire reported localized sensitivity of the hand following penicillin applications. Similarly L. Goldman reported allergy of the lips (cheilitis) following the use of a penicillin mouth rinse.

The danger from the use of the newly prepared virus vaccines grown in egg embryo was pointed out by A. J. Stull. He reported that the injection of such vaccines in egg-sensitive individuals may result in dangerous systemic reactions.

While these contributions emphasized the practical problems in allergy, work was also done on the fundamental questions and on the diagnosis of unusual allergic conditions. The importance of heredity as a background of allergy, while long recognized, was re-emphasized in a detailed study by K. A. Stiles and his co-workers. The authors studied the inheritance of respiratory allergies in 1 family of 5 generations with 232 persons. The incidence of allergy in this group was 22.4% in contrast with about 7% in the general population. They confirmed that the inheritance was for the general allergic predisposition rather than for the specific allergic condition and concluded that respiratory allergy behaves as an irregular dominant character.

In the field of diagnosis serious allergic involvement of the eye was reported by several workers. F. C. Cordes and R. Cordero-Moreno described four cases of atopic cataracts in

whom sensitivity to pollens and foods was established. L. Bothman studied six patients with iritis who were sensitive to pollens and moulds. Improvement of their condition occurred following adequate hyposensitization.

The occurrence of an allergic reaction in the joints to give the symptoms of subacute arthritis was described by L. H. Crip in four cases. The joint pains subsided after the elimination of foods to which these patients were sensitive.

Allied Council for Japan: see JAPAN.

Allied Military Government. In the year 1946 there was a shift from negative to positive civil affairs in military objectives in liberated and enemy countries. With the destruction of the enemies' military machines and the removal of the nazis, ultra-nationalists and militarists from the political and economic life, the long-term Allied program to aid these countries in qualifying for membership in the community of nations assumed dominance. In aid of the democratization objective, the defeated enemies were granted more and more responsibility for their own political and economic existence; the role of the occupying forces was contracted more and more towards its long-term function of guarantors of the maintenance of democratic processes and supporters for attainment of self-sustaining economies stripped of war potentials.

There was little change in the area of responsibility of the United States. In 1946 the United States was participating in the government of 200,000,000 people in the occupied areas of Italy, Korea, Austria, Germany and Japan. In Italy there were only two provinces under Allied control pending territorial settlements; controlled in the north by the U.S.S.R. and in the south by the United States, Korea was without political experience and a corps of trained government personnel to assume complete responsibility for its government; Austria, although divided into four zones for occupation purposes, was governed by a freely elected Austrian central government, which was subject to control by the Allied high commissioners pending execution of a peace treaty. The German reich and its central agencies disappeared with defeat of its army. In 1946 that country was controlled by the four-power Allied Control council in Berlin when inter-Allied agreement was possible, or on a zonal basis when agreement was not possible. The United States administered Japan as a unit with the assistance and advice of its Allies on matters of policy.

In Washington, D.C., the war department and the state and navy departments were the triumvirate formally banded together in a committee, known as S.W.N.C.C. (State-War-Navy Coordinating committee), which provided the policy, direction and guidance for U.S. military occupational commanders in Europe and in the far east. Also the war department, through its daily cable contact with its field commanders, reflected the practicalities and administrative limitations of U.S. occupation forces and brought this point of view to S.W.N.C.C. wherein the political and economic views were secured from the state

ALLIED PATROL TEAM, composed of a British, a Russian, a French and a U.S. military policeman, chat before starting their tour of duty through the British zone of Vienna in 1946

department. In March a new assistant secretaryship for occupied areas was created in the department of state. While the executive responsibility remained military, many civilians were hired in the United States and sent to the occupied areas to relieve military personnel. In the fall of 1945, there had been approximately 30,000 U.S. military personnel engaged in civil affairs in occupied areas. As rapidly as security considerations permitted, civilian personnel was employed so that the control would be more representative of all interests in the United States. Too, as conditions permitted transfer of responsibilities to indigenous governmental agencies, the over-all number of U.S. nationals employed in civil affairs was decreased. By the summer of 1946, the total employed in civil affairs had been reduced to 18,000, of whom 11,000 were military and 7,000 civilian. By fall, this number had been reduced to 13,500, of whom 7,800 were military and 5,700 civilian. The occupation forces of 730,000, deployed tactically throughout the areas, of necessity were military.

The Allies were faced at the outset with the repatriation of 10,000,000 civilians and almost 10,000,000 enemy military personnel. The enemies had, through varying degrees of coercion, imported millions of enforced labourers and had sent out millions of their own nationals to exploit occupied areas militarily and economically. Identification, care, and control of these displaced persons of Allied, friendly, neutral, and other non-enemy nationals at times taxed the facilities of the entire civil affairs and occupational forces organizations. These people reported to displaced persons camps only when they found it expedient to do so; too, there was constant and unauthorized movement across

zonal barriers. At the end of 1946, the task of moving this huge mass of people was more than 80% completed. Of displaced persons 6,000,000 had been repatriated from Germany, 3,500,000 of whom were from the U.S. zone. At the close of the year 550,000 remained in the U.S. zone, voluntary nonrepatriables who for political, economic or other reasons did not desire to return to their homes and who, under United States policy, had not been forced to do so. In the far east, 1,000,000 Koreans were repatriated from Japan. In addition to the displaced persons, the occupation forces had the task of moving hundreds of thousands of enemy nationals expelled from other countries. Of German civilians 1,500,000 were expelled from the Sudetenland, Czechoslovakia and elsewhere in Europe and moved to the U.S. zone of Germany; and 2,500,000 Japanese civilians were moved from Korea, China and elsewhere in the far east to Japan.

The civil affairs responsibility of most immediate interest within the United States was the purging of nazis and Japanese ultra-nationalists both from government and positions of influence in commerce and industry. These were the people charged with guilt for the war; the party members, collaborators and other adherents; the jingoists, chauvinists and expansionists. In the U.S. zone, Germany, of 1,456,467 persons in government and business investigated by military government, 373,762 were disqualified for government position or private position higher than that of labourer. Denazification in the U.S. zone was so far advanced and responsible German government of the zone so well established by the summer of 1946 that further denazification was delegated to the Germans to act under supervision and direction of the military governor. In Japan, where a government was found intact and willing to

carry out the orders of the supreme commander, purging of ultra-nationalists was from the outset made a responsibility of the Japanese acting under direction of the supreme commander. By the close of the year, 186,000 Japanese had been dismissed from government positions.

At the end of the year, the military forces of the enemy had been demobilized and the organization destroyed. In Germany the United States forces processed 7,818,752 prisoners of war. At the end of September 62,419 were being retained in labour units to assist the U.S. occupation forces.

Allied policy was to destroy or to remove as reparations all war and other plants surplus to the permissible peacetime needs of the enemies' economies. In this period much was accomplished in destruction of war plants and reparations. Of the 98 war plants in the U.S. zone of Germany, 64 were destroyed. In addition, 698 plants in the three western zones, 157 of which were in the U.S. zone, were labelled available for reparations, and the first shipments made to allottee nations. At the end of the period, further shipments were suspended pending agreement on the economic unification of Germany with which reparations were inextricably bound. In Japan, the enemy armed forces had been demobilized but destruction of war plants and reparation removals were awaiting soviet participation in an international reparations conference.

During the year much progress was made in the establishment of representative and responsible governments. In aid of this democratization program, a free press and democratic education system was developed and religion stripped of state control. The Japanese, in their 35-year occupation of Korea, pursued a policy which prevented the training of Koreans in government unless they demonstrated affection for Japanese control and disaffection for an independent Korea. The basic U.S. policy was to sponsor political growth among the Koreans and to train Koreans to administer their own government. By the close of the year 1946, there were Koreans in every department of government to whom was delegated all possible responsibility; political parties were organized and their leaders were advising the U.S. commander. The interim legislature for southern Korea was convened in Dec. 1946. Half of the members of this legislature were elected by the voters in the U.S. zone and the remainder appointed by the commanding general, U.S. army forces in Korea. After the liberation of southern Korea, U.S. forces dismissed the 70,000 Japanese and disaffected Koreans found in government office; all Japanese were dismissed from business and other private employment and all Japanese were repatriated from southern Korea. In Japan, much progress was made in the democratization of the dictatorial government. Political parties were permitted to organize; democratic national elections, in which women participated for the first time, were held and the constitution, rewritten to include democratic principles, was passed by the Japanese diet in October and announced by the emperor to the Japanese people in November. A revived press, freed of traditional control, played an important role in informing the public of the issues and in constructive criticism of the constitution.

Italy was, at the close of the year, under control of its own elected government, subject to authority exercised for security of Allied troops by the Allied commander in one small area. The Austrians elected a government which assumed responsibility for administration of the nation. In Germany, while Allied disagreements prevented the creation of German central administrative agencies as provided for by the Potsdam declaration, political parties were organized by states and were active in all the zones. The United States led all other zones in political development in Germany. In its zone, governments were elected for towns less than 20,000 in January; for county governments

in April; for cities more than 20,000 in May and for each of the three German states in the U.S. zone in November. As soon as the governments in the three states would have selected their ministries, all officials appointed by military government would have been replaced by officials elected by the people or by their representatives. Members of constitutional assemblies were elected in June in each of the states of the U.S. zone to draft democratic constitutions. These constitutions were drafted, submitted to the people and ratified in November and December. In October, elections for representatives to the city council and the 20 borough councils of Berlin were held. These were the first elections held in Berlin after the inception of the occupation and also the first elections held in Germany under the combined auspices of the four occupying powers.

Accompanying the program to make the defeated enemy peoples responsible for their government, exercising only that control necessary to assure continuance of democratic processes, there was a drive to make them responsible for their own economic existence. In both Germany and Japan access to the raw materials of the world was granted as rapidly as supplies were available and as rapidly as their industrial plants, reshaped and stripped of their war potentials, were able to use them. In addition to lack of raw material imports, the Germans suffered a critical shortage of transportation because of war damage and lack of fuel. Zonal shortages of fuel and, in part, materials were caused by the zonal boundaries of the occupying powers. The Potsdam declaration provided for administration of Germany as a political and economic unit. Economically and administratively, the four zones of Germany were interdependent. The zones were established to determine only troop occupation responsibility of the several Allies; insofar as these lines had been used to establish administrative and economic barriers, they impeded attainment of almost all the basic objectives of the Allies. Secretary of State Byrnes announced at Stuttgart in late summer the determination of the United States to provide for integration of the administration of Germany by the four powers insofar as possible and invited all the Allies to join with the United States. At that time the British agreed to a merger of the British and U.S. zones, to be effective Jan. 1, 1947.

In the program to make the occupied areas self-supporting, raw materials were being made available. As part of this program 890,000 bales of cotton were shipped from the United States to Japan, and 220,000 bales to Germany, the cost of the raw material to be repaid in finished products. In addition, imports valued at \$30,281,200, principally raw silk, were received in the United States from Japan, and \$2,458,641 from Germany. To stimulate further production of consumer goods and to make Germany self-supporting, businessmen were permitted to enter the U.S. zone of Germany for purchase of exportable commodities. Postal service between Germany and Japan and the outside world was expanded to include informational and non-transactional correspondence with respect to trade prospects and other messages looking toward the resumption of business relations.

Along with its other occupation duties, the Allies went ahead in 1946 in their determination to punish war criminals. Of major war criminals 49 were indicted for trial before international tribunals in Nuernberg and Tokyo. (*See WAR CRIMES.*)

One of the main objectives of military government in the occupied countries was to re-establish and encourage by positive means democratic life. The civil affairs division was responsible for the administration of a broad program of re-education to attain this end. To accomplish this the following means were being utilized and controlled: schools, churches, social organizations, cultural materials and mass media (press and radio, books and periodicals, films, theatres and music).

Before initiating this program of re-education, measures were

taken to remove individuals who had been closely identified with militarism or the totalitarian governments in the fields of education, information and religion. In Germany and Austria this was done through denazification and in Japan through the screening of teachers. Books and publications which expounded militaristic or ultra-nationalistic views were segregated. Publications licensed by military authorities in Germany, Austria and Japan were subject to post-publication censorship only. Militaristic and nationalistic propaganda, criticism of the Allied nations or of military government and violations of security regulations were forbidden. Within these limitations it may be said that a free press existed in those countries.

On the positive side much had been accomplished by the close of 1946. As of Nov. 1946, there were 44 newspapers with a circulation of 4,159,607; 238 periodicals and 1,664 books were licensed for publication by Germans in the U.S. zone of Germany. A newspaper, *Die Neue Zeitung*, with a circulation of 1,600,000, and 3 periodicals, *Heute*, circulation 400,000, *Amerikanische Rundschau*, circulation 200,000, and *Neue Auslese*, circulation 600,000, were being published by military government in Germany and the bulk of their materials was supplied by the civil affairs division. In addition, much feature and background material was sent to German newspapers. Special requests from the occupied areas for the publication of articles, books, periodicals and other material were handled and arrangements made for publication in the occupied areas. Of libraries and information centres 49 were already operating or were to be opened by the end of the fiscal year—20 in Germany, 4 in Austria, 1 in Trieste, 17 in Japan and 7 in Korea. In view of acquired responsibility for Okinawa and Trieste an additional library and information centre was expected to be opened in each of these places. These libraries were being supplied with a set of basic materials such as reference works and outstanding examples of democratic, particularly U.S., culture and achievement, comprising 3,000 vol. Each of these centres furthermore was being equipped with 200 to 300 U.S. periodicals, a collection of U.S. recorded music, a set of documentary and educational films, along with the necessary phonographs and projectors. Exhibits of U.S. painting and photography were also being provided for many of these information centres. Documentary films produced in the United States specifically for reorientation purposes were to be exhibited in theatres and also in information centres in the occupied areas. Many of these were primarily designed for use in the educational systems. A total of 622 licences for theatres were granted in Germany. Lending libraries of U.S. music were being set up in several key cities, with the scores available for borrowing.

Provisions were also made for the exchange of professors, students and cultural experts. This was limited to personnel going to the occupied areas from the United States for periods of two to six months for a specific task. It was contemplated that by July 1, a total of approximately 500 visiting specialists from the United States would have been sent as consultants to the occupied areas.

The elementary and secondary schools of Germany and Austria were opened and at the end of the first year had 97.4% and 93%, respectively, of the eligible pupils in attendance. More than 5,328,616 emergency textbooks were printed in Germany by military government for use in German elementary and secondary schools. Meanwhile, manuscripts were solicited from German educators and 842 were read and approved for current adoption and use. Of teacher training colleges 42 had been set up in the U.S. zone of Germany and had already produced 6,500 graduates to teach in German schools. Vocational and adult education was instituted on a large scale.

A project of assembling a collection of around 500 of the

best U.S. textbooks to be sent to 35 localities in the occupied areas was completed. The selection was made by groups of experts in elementary and secondary education from public and private schools. These books were designed as guides and examples for the native educators in the occupied areas whose responsibility it was to rewrite the textbooks for their own schools.

Youth activities under the direction of military government and with the co-operation of U.S. tactical troops were set up in each German county. These activities included sport, recreation, religious training and training designed to rehabilitate German youth. The total number of youth groups as of Sept. 1 was 2,901, with a membership of 500,000. These included revival of such organizations as Boy Scouts, Girl Scouts and Pathfinder groups.

Changes and reforms in the existing German educational system were also introduced by the responsible German authorities but with the encouragement of military government. These included an extension of state-sponsored free education for all social and economic classes, and for both sexes, the introduction of student self-government in the secondary schools and revisions of the structure of the educational systems in the various *Laender*. An education mission was sent to Germany in Aug. 1946 and in its report made recommendations for future action. A long-range policy statement for German education, published Aug. 13, 1946, stated the ultimate objectives of the educational policy. The constitutions adopted by all three of the German states in the U.S. zone in November and December made provision for a great extension of educational opportunity to all portions of the population, regardless of sex, social status or economic means.

In Austria the same program was followed in denazification, in revising the school system, in publications and information services generally.

In Japan many steps were taken to reform the educational system. Schools were demilitarized, state Shinto was abolished, textbooks and curricula were revised, co-education was extended and encouraged, private schools were operating with greater freedom than ever before and programs of adult education through radio, motion pictures, press and libraries were undertaken. The ministry of education set up advisory and reviewing bodies for carrying out the directives of S.C.A.P. (supreme commander for the Allied Powers). An education mission from the United States visited Japan at the invitation of the supreme commander and made recommendations for future developments in the field of education. Of periodicals, 1,780 with a circulation of 14,000,000 to 15,000,000 were appearing in 1946. Of the many newspapers published the 3 chief papers had a circulation of more than 8,000,000. Freedom of assembly, speech and religion were granted subject to the necessities of military security. The free criticism of the Japanese draft constitution indicated the extent of developments of a free press in Japan. The program of libraries and information centres was to be completed by the end of the year.

In all the occupied territories, freedom of religion was permitted and encouraged. As far as possible the ecclesiastical authorities in the occupied territories were given the responsibility of ridding themselves of any members of their faith who had been closely identified with militaristic and ultra-nationalistic activities. In every case the ecclesiastical authorities filled any vacancies in their churches subject only to the negative check of military government. Assistance was given in all of the occupied territories to the existing religious organizations in permitting conferences and meetings on church problems, pastoral letters and other religious publications and in the revival of youth activities. Aluminum. Production data became available during 1946 for most of the producing countries during the war years, and are shown in Table I. The peak of war demand was reached in 1943, at three times the prewar level, and subsequent declines brought the 1945 output down to a figure that was of the same general order as was expected for postwar operations.

United States.—A brief cross section of the progress of the industry in the U.S. is given in Table II.

In the disposal of the government-owned plant capacity built for war production, efforts were made to strengthen the com-

SCENE IN AN ALUMINUM sheet mill near Chicago, showing a machine cold rolling sheets of aluminum during 1946. Most of the raw material was aluminum battle scrap from war planes

petitive position of the industry.

As a result of the increased production capacity and reduced prices, postwar uses were expected to expand, especially in applications where saving of weight is a factor. (See also METALLURGY.)

American Citizens Abroad. During the period of about 50 years up to World War II, U.S. citizens had, in increasing numbers, taken up temporary domicile abroad of such duration as to constitute several years foreign residence. In 1939, at the outbreak of World War II, there were living outside the United States more than 300,000 U.S. citizens. This figure, of course, does not include those persons who were temporarily abroad as tourists or pleasure seekers or temporarily visiting relatives or attending school. In the fall of 1939 the U.S. government, through its official representatives abroad, urged the return to the United States of those persons whose presence outside the United States was not required by important and urgent matters which could not be

otherwise attended to than through their personal presence. Reasonable numbers began their homeward journey from the orient as well as from Europe but others remained in the belief that war and its consequences could not overtake them. When the United States entered the war its representatives were withdrawn gradually from those countries involved in the war on the side of the enemies and the protection of U.S. interests and U.S. citizens was left to the Swiss government. No census was taken of those who remained but as the countries of the occupation were recovered by the Allied armies U.S. citizens made themselves known and sought aid from U.S. representatives. During 1946 the return to the United States of many semipermanent residents abroad continued. But the cessation of hostilities made it possible and desirable for businessmen and professional people to concern themselves with the restoration of commercial trade and cultural intercourse between the United States and that part of the world which had been in enemy hands. As the military operations released aircraft and surface ships U.S. representatives went abroad in increasing numbers to visit their former connections not only in the war areas but in the neutral and Allied countries and actively restored trade and promoted a return to normalcy. Many former representatives of U.S. business, with their families, returned to their stations abroad and there was residing outside of the United States by Jan. 1947 a fraction of the more than 300,000 U.S. citizens who were resident abroad in 1939, augmented by this large number of U.S. citizens who returned to attend to commercial and professional matters as well as by those whose presence was required by alien relatives and family interests. In addition to this, the U.S. armies of occupation were in four foreign countries—Germany, Austria, Korea and Japan—and were being joined by members of their families from April 1, 1946. The rules covering the travel of dependents of servicemen were set up and carried out by the military authorities. The documentation of these people with passports was necessary in order that they might move about in countries other than the one in which they resided, as a relief from the monotony and hardships of occupation. From April 1, 17,769 dependents were sent overseas into the European area; into the Mediterranean area 1,739; into the China, Burma, India theatre 479; to the mid-Pacific 3,535; to the Philippines 1,852 and to the Japan, Korea area 4,289. In the number sent to the mid-Pacific were included persons who travelled to the smallest of the islands under U.S. occupation and were living comfortably in areas never reached before by U.S. women and children. There was temporary travel to Europe of several thousand persons solely for the purpose of assisting their relatives who had need not only of material things but of the consolation brought by the personal contact with their more fortunate relatives who escaped the personal experience of the horrors and hardships of occupation, bombing and extreme rationing. These U.S. citizens made an additional contribution to the return to normalcy in Europe by a moderate amount of travel and visiting such as was established on a rather large scale for use during furloughs granted soldiers of the U.S. forces in Europe and their families. In this way gradual restoration of local transportation, hotel facilities and betterment in food obtainable in restaurants was stimulated. Because of the ever-changing situation during the calendar year of 1946 it was not possible to do more than record an incomplete summary of people residing abroad (*see* table on p. 48).

In general the countries of the western hemisphere received, during the calendar year 1946, about the usual number of professional and business persons, students, teachers and those travelling for pleasure, health or cultural reasons. The full realization of travel plans for persons desiring to spend a year or more within the western hemisphere was hampered only by the lack

of the prewar type of surface and air transportation. In Asia, with the exception of Japan and Korea, businessmen, missionaries, government officials and civilian specialists to assist in rehabilitation work moved freely and found transportation adequate for their travel. In China specifically and in the countries of Europe, those U.S. citizens residing on a semipermanent basis in 1946 comprised an extremely large number of relief and welfare workers, persons rendering aid to government and to private individuals in economics, agriculture, reconstruction and rehabilitation of every character. An unusually large number of government officials were residing in Europe for war crimes work, for civilian employment in the occupation areas and as advisers in all forms of specialized activity. The year 1946 found an extremely critical food and housing shortage in most countries and travellers experienced personal hardship and privation, in a lesser degree, however, than in the preceding year.

American Dental Association. The American Dental association, founded in 1859, had in 1946 a membership of more than 61,000 dentists, approximately six-sevenths of the practising dentists in the U.S.

During the year, dentistry made noticeable advances in the field of dental research, particularly in relation to the control of dental caries. The American Dental association sponsored a bill in congress which, when passed, would enable the U.S. public health service to increase greatly its dental research activities. The association sponsored two additional bills in congress, one to provide grants-in-aid to states for dental health education and dental care, especially for children; and one to improve dental service in the U.S. army. It continued to co-operate with the Veterans' administration to improve dental service for veterans. It established health goals for children and youth and developed a manual on dental health programs for elementary and secondary schools. It established basic standards of hos-

pital dental service required of approved hospitals. It adopted standards for the approval of hospital dental internships and residencies and for the approval of courses for the training of dental technicians.

One new dental school was established in 1946, increasing the number of dental teaching institutions to 40, all of which, except three, had been approved or provisionally approved by the Council on Dental Education of the association.

The association increased its facilities for the certification of dental materials, medicaments and dentifrices and enlarged its public educational program. It increased the number of issues of the *Journal of the American Dental Association* from 12 to 24 per year and continued to publish the *Journal of Oral Surgery* on a quarterly basis.

A full scientific meeting of the association was to be held in Boston, Mass., in Aug. 1947.

Officers for the year 1946-47 were: president, Dr. Sterling V. Mead; president-elect, Dr. H. B. Washburn; first vice-president, Dr. E. B. Penn; second vice-president, Dr. B. B. McCollum; third vice-president, Dr. M. D. Huff; secretary, Dr. Harold Hillenbrand and treasurer, Dr. Roscoe Volland. (L. W. M.)

American Economic Association: *see* SOCIETIES AND ASSOCIATIONS.

American Federation of Labor. The membership of the American Federation of Labor reached an all-time high in 1946 with 7,151,808 paid-up members on Aug. 31. Two new international unions were formed during the year, and a new Maritime Trades department was created within the federation.

During the year the federation continued its activities in both national and international affairs affecting the workers. This included not only active participation in the International Labour organization, but in the re-establishment of free trade unions in both the old world and the new. The convention of the federation stressed the need for greater public understanding of the problems of the workers and the constructive work being done by trade unions. Federation plans for the future called on both management and the workers to establish true collective bargaining machinery for their mutual benefit, augmented by sincere efforts to work together for better and greater production. The federation favoured early and complete abandonment of unnecessary government controls over the economy of the U.S.; the re-establishment of the U.S. system of free enterprise and the negotiation of work contracts through the orderly processes of collective bargaining.

Legislative activities were continued on both state and national levels. Every effort was to be made to repeal existing antilabour laws, and to prevent the enactment of repressive legislation in the future. The federation continued its established practice of nonpartisanship in politics—calling on workers to reward friends and defeat enemies at the polls. The urgent need for a reorganization of the department of labour was emphasized by the federation, to the end that this government agency might be more effective in the work for which it was created. The reorganization plans which had been effected were unacceptable to the federation. The need for adequate public housing was stressed and the implementation of a constructive public housing program was urged by the federation.

The federation was especially active in the field of social insurance with special emphasis on (1) the development and introduction of legislation to establish a unified, comprehensive national system of social insurance, and (2) continued interim efforts to improve the state unemployment compensation programs. In the field of education, the federation sought greater

educational opportunities for all through federal aid for the school system. The federation was also vitally interested in a sound program for vocational education and directed special efforts in that field. Continued support was given to the Workers Education bureau, which is the educational agency of the federation charged with responsibility for development of adult education programs.

In its pronouncement on wages the federation reaffirmed its previous declarations in support of increased wages by which workers would receive a just and equitable division of profits accruing from the wealth they produce.

A special organizing drive was being carried on in the south. The federation also actively participated in an agricultural program designed to relieve the south of its economic dependence on cotton. A decided stand was taken for equal employment opportunity and full participation in unions of the American Federation of Labor, regardless of race, creed, or colour.

American Legion. The American Legion is an organization of U.S. veterans of World Wars I and II. Originally chartered as a World War I veterans' organization by congress in 1919, it became a two-war organization Oct. 29, 1942, when Pres. Roosevelt signed Public Act 767, making honourably discharged veterans of World War II eligible for membership.

The accomplishments of the American Legion in 1946 included: (1) the enactment into law of a bill to provide terminal leave pay for enlisted personnel and veterans of the armed forces; (2) enactment into law of a bill liberalizing National Service Life Insurance held by World War II veterans; (3) enactment into law of a bill amending the Surplus Property act to provide World War II veterans a set-aside list of surplus items for purchase and a priority in remaining items second only to that of the federal government; (4) enactment of federal legislation providing a 20% cost-of-living pension increase for all disabled veterans of both world wars and removing pension reductions for veterans during periods of hospitalization; (5) enactment into law of a bill to increase burial allowances for veterans; (6) enactment into law of a bill extending social security benefits to dependents of World War II veterans; (7) enactment into law of a bill increasing to 25,000 the number of regular army officers; (8) extending financial aid to 325,700 children of veterans as one of its many contributions in the child welfare field; (9) sponsoring the V.A.L.A.R (American Legion Army Recruiting) plan for which the legion was hon-

PAUL H. GRIFFITH (left), elected national commander of the American Legion at the Legion convention in San Francisco on Oct. 4, 1946. With him are D. A. Griffith, his father (centre) and John Stelle, retiring commander

oured by the war department; (10) expanding its rehabilitation service to 45 offices and contact points offering services and counselling to veterans in education, vocational training, disability allowances, discharge reviews, application for terminal leave and other problems; (11) allocating with its auxiliary \$50,000 for research into rheumatic heart disease; (12) making many recommendations to the Veterans' administration for improvement of services and facilities for veterans as the result of studies and surveys; (13) assisting in adjudication of hundreds of thousands of death and disability claims of veterans and their dependents; (14) strengthening its Americanism program to combat foreign "isms"; (15) conducting nation-wide youth training programs including junior baseball, boys' states, boys' forum on national government, national high school oratorical contests, school medal awards, essay contests and sponsoring more than 3,000 Boy Scout troops; (16) formulating a detailed plan of maximum employment based on sales, service and distribution as the result of a nation-wide survey of industry and business by employment division officials of the legion; (17) sponsoring a national "Jobs For All" essay contest; (18) producing with the American Mutual Alliance a film, *No Help Wanted*, urging employment of the disabled veterans; (19) drafting a comprehensive housing plan from recommendations of a special committee of World War II veterans who surveyed housing conditions in every section of the nation; (20) sponsoring a "Gifts To Yanks Who Gave" Christmas program; (21) participating in National Education Week, which it originated.

As a result of its 28th annual national convention in San Francisco the legion: (1) urged repeal of a law placing limitations and ceilings on the on-the-job training provisions of the legion-sponsored G.I. Bill of Rights; (2) urged elevation of the federal security administrator to cabinet rank; (3) asked restriction of all immigration until 1948; (4) proposed a single department of national security with provisions for army, navy and air forces on equal level; (5) demanded redemption of G.I. terminal leave government bonds into cash; (6) asked exemption for currently accrued federal income tax to the first \$5,000 of earned income for all honourably discharged World War II veterans; (7) proposed a world police force and a strengthened plan for United Nations.

All membership records of the American Legion again were broken in 1946. On Dec. 31, 1946, there were more than 3,321,-

ooo members in 15,700 posts. This was a gain of 1,700,000 over the membership in 1945. Of the members 68% were World War II veterans. The American Legion auxiliary, showing a gain of 170,000, had a membership of more than 800,000 in 10,600 units. The Forty and Eight completed the year with 72,000 members, and the auxiliary counterpart, the Eight and Forty, had 11,300.

The two national publications, the *American Legion Magazine* and the *National Legionnaire*, each had a circulation in excess of 3,300,000.

At the San Francisco national convention Paul H. Griffith of Uniontown, Pa., was elected national commander for 1946-47. (P. H. GH.)

American Library Association. American Library association (A.L.A.) is the oldest professional association of librarians, library trustees and friends of libraries. Although the association's membership, which is open to all persons and institutions, is drawn from all continents, it is primarily composed of individuals interested in library development in the United States and Canada. Organized Oct. 6, 1876, in Philadelphia, the association is affiliated with more than 60 other library associations throughout the world and works closely with organizations and government agencies concerned with education, research, recreation and public service. The activities of the association were carried on in 1946 by a headquarters staff of 83, assisted by more than 600 persons serving on approximately 80 volunteer boards and committees. Carl H. Milam was executive secretary of the association.

In June 1946 the A.L.A. transferred headquarters to one of the historic McCormick homesteads at 50 East Huron street, Chicago 11, Ill. Julia Wright Merrill, long active in the extension of free public library service, retired after 21 years with the association.

During the first postwar year, the association was again concerned with efforts to extend complete and adequate library service to the United States especially through the Public Library Service Demonstration bill, introduced in congress on March 12. It promoted the economic security and professional advancement of librarians by the formulation of new minimum salary standards and tenure policies. A long-term plan for the development of libraries neared completion and was to be published in 1947 as the *National Plan for Library Service*. It results from the work of several specialists over a period of years.

An A.L.A. International Relations office, located in the Library of Congress annex, Washington 25, D.C., was under the direction of Marion A. Milczewski. Harry M. Lydenberg, former director, retired in the course of the year. The International Relations office was engaged during 1946 in promoting cultural relations through the operation of U.S. libraries in foreign countries, the interchange of librarians and publications between nations, the importation of scholarly books and journals and the rehabilitation of war-devastated libraries. The association's work in Latin America, Europe, China and other devastated war areas is financed out of special funds from government, foundations or individual libraries. Late in 1946 the A.L.A. International Relations board voted to continue the work of the office for five years if funds could be found after the expiration, in 1947, of the existing grant.

The association participated in planning for the United Nations Educational, Scientific and Cultural Organization (U.N.E.S.C.O.), and its executive secretary served as a technical adviser to the U.S. delegation at its meeting in November. Ralph A. Ulveling of Detroit, Mich., then A.L.A. president, toured the European occupation zone in the spring of 1946 at the request of the war department and made recommendations

on library service for occupation troops.

Harry M. Lydenberg, former director of the A.L.A. International Relations office, participated in a Library of Congress mission to gain information about available research resources in Europe. Leon Carnovsky represented the A.L.A. as a member of the commission of educational advisers which visited Japan during the year.

Because of the need to integrate library welfare with government plans, the A.L.A.'s program had for some years focussed on Washington, D.C. An A.L.A. National Relations office was located at 1709 M street, N.W., Washington, D.C. Under the direction of Paul Howard, the office, established in Oct. 1945, promoted and safeguarded library interests throughout 1946.

Working in close co-operation with other library agencies, the National Relations office was concerned with the disposal of surplus books and other surplus property to libraries, recognition by the government of the essentiality of library service in any national research program, inclusion of libraries in public works proposals, social security for library employees, maintenance of low postal rates on books, improvements in document distribution and state demonstrations of public library service organized through the U.S. office of education.

Conferences.—The year 1946 saw the first A.L.A. mid-winter and summer conferences from the time travel restrictions were enforced in 1942. The midwinter conference was held in Chicago while the association's 65th annual conference drew 2,500 delegates including 20 foreign librarians to the Memorial auditorium, Buffalo, N.Y. The following officers were inaugurated at the conclusion of the conference: Mary U. Rothrock, Tennessee Valley authority, president; Paul North Rice, New York public library, first vice-president and president-elect; Nell Avery Unger, Library Association of Portland, Portland, Ore., second vice-president; Rudolph H. Gjelsness, University of Michigan, Ann Arbor, Mich., treasurer.

The annual citations for distinguished service as library trustees were awarded in Buffalo to James J. Weadock, vice-president of the board of trustees of the Lima public library, Lima, O., and Mrs. Myrtle J. Price of Tuscaloosa, Ala., chairman of the Alabama public library service division. At the same time, Lois Lenski received the 25th annual Newbery medal for *Strawberry Girl*, judged to be the outstanding contribution to children's literature in 1945. The tenth annual Caldecott medal for the most distinguished picture book was conferred upon Maud and Miska Petersham for *The Rooster Crows*, a book of U.S. rhymes and jingles. The John Cotton Dana publicity awards, sponsored by the *Wilson Library Bulletin* and the A.L.A. Public Relations committee were awarded to seven libraries for effective public relations programs.

By vote of the A.L.A. council, Frederic G. Melcher, president of the R. R. Bowker company, publisher of the *Library Journal* and the *Publishers' Weekly* was elected an honorary member of the association "for giving himself generously and effectively to the cause of books and reading." From its founding, the A.L.A. had conferred honorary membership on only 28 persons.

Income.—The association's endowment in 1946 was approximately \$2,100,000. The income in 1945-46 was about \$875,164, approximately \$92,215 was drawn from membership dues, sales of publications, etc., and \$69,150 was obtained from the endowment fund. Payment of group retirement annuity premiums was \$153,147 and \$415,466 came from outside sources in the forms of grants or payments for specific purposes. In September, the association received a gift of \$500 from the Wisconsin Federation of Women's Clubs, to finance a memorial membership for Mrs. Lucy Morris, founder of the federation.

Publications.—Despite higher production costs, the association's publishing program was self-sustaining. A.L.A. publishing

is a nonprofit, co-operative enterprise conducted for libraries in the interest of library progress and education generally.

During 1946, in addition to the regular periodicals, *A.L.A. Bulletin*, *Booklist*, *Subscription Books Bulletin*, *College and Research Libraries* and *Hospital Book Guide*, it inaugurated the selling of children's stories on records and the Canadian film, *Library on Wheels*.

The A.L.A. Board of Education for Librarianship gave special attention to the redirection of professional education in line with changing requirements for librarianship, to the need of recruiting more personnel for the profession and more scholarships in library schools, to certification, to accreditation and to the need of veterans for orientation. (M. C. T.)

American Literature. The historical parallel drawn by many between 1946 and 1919 apparently ceased when the literature of those postwar years was compared. After World War I, as after World War II, there had been labour strife, inflation, a housing shortage, political shifts, a Russian scare and a good deal of confusion. But the year 1919 produced a number of books foretoking new developments in American literature—H. L. Mencken's *Prejudices* (first series), Sherwood Anderson's *Winesburg, Ohio*, James Branch Cabell's *Jurgen*, Eugene O'Neill's *The Moon of the Caribbees*, Waldo Frank's *Our America* and John Reed's *Ten Days that Shook the World*.

Critics were unable to see any such trend, or indeed any such outstanding literary achievements as some of these were, in 1946. The fictional and poetic works of the year were generally of mediocre to fairly high grade but not particularly new in content or method. And though there were many solid and thoughtful nonfictional works, none suggested particularly novel lines of thought or action. Both fiction and nonfiction, as was to be expected, tended to look back to wartime experiences or lessons and to survey problems which had been apparent during the years of warfare.

There was, evidently, only a slight decline in the recently developed enthusiasm of the public for reading. As had been predicted, mounting gasoline sales were accompanied by declining book sales, but the decline was not as great a one as some had foreseen, and as yet few publishing houses could complain of hard times. About 7,500 new titles appeared on the lists, about a fifth of them fictional works and about a tenth histories and biographies. The sales of quite a number of these, by prewar standards, were large: several novels found more than 1,000,000 purchasers apiece. This was partly the result, to be sure, of the booming activity of the book clubs. These continued to grow, the two oldest achieving 2,250,000 members between them and one of the youngest acquiring a total of 225,000 members.

The book which probably caused more comment than any was one which had comparatively small sales, Edmund Wilson's *Memoirs of Hecate County*. The furor about this volume in some ways recalled the turmoil about *Jurgen* back in 1919, since much of the comment was stimulated by the extreme frankness of some passages in Wilson's collection of short stories. Cases against the publisher and author were tried in courts scattered from New York to California, and eventually the volume was withdrawn. Yet the excitement caused by the book actually was slight compared with that which had been created by *Jurgen*, and it was certain that Wilson's generally intellectual, symbolic tales would have nothing like the impact of Cabell's book upon the literary fashions of the years following its appearance.

Trends in Fictional Techniques.—Two first novels, both by women, revealed talents far above the ordinary and perhaps forecast coming developments of a technical sort in fiction. Both employed a modified stream-of-consciousness narrative method,

reminiscent of the procedure of the recently rediscovered Henry James or perhaps of Virginia Woolf. The first was *Do I Wake or Sleep?* by Elizabeth Bolton, which sets down the perceptions of the woman Millicent during a crucial 24-hour span in the year 1939. The happenings thus presented not only vitalize three leading characters but also body forth the impact of the coming of the war upon life in New York city. The other novel was *Delta Wedding*, the first novel-length narrative by an author who heretofore confined her activity to the writing of short stories—Eudora Welty. In this novel, as in Miss Bolton's, the narrative is a record of the perceptions of a sensitive but limited observer—this time a young visiting cousin at a wedding on a Mississippi delta plantation. The book is a subtle evocation of the scene as well as of the members of a family in the deep south.

Another fictional technique which flourished during the year was that of satire, much of it fairly ferocious. A variety of groups and institutions were attacked: Frederick Wakeman's *The Hucksters* satirized advertising and the radio. Helen Howe's *We Happy Few* giped at a snobbish group who lived in Cambridge, Mass., but who had recognizable prototypes among the intellectuals of many other towns and cities. John Marquand's novel, *B.F.'s Daughter*, satirized many contemporary attitudes. These three were very popular: all made best-seller lists. Less popular, but equally biting, were Pat Frank's *Mr. Adam*, a somewhat Rabelaisian fantasy which took off the Washington scene; Bentz Plagemann's *All for the Best*, which had at various aspects of civilian and naval life, and Jerome Weidman's *Too Early to Tell*, which dealt harshly with the wartime activities of the OWI.

Recurrent Fictional Themes.—These were the most noteworthy technical trends in fiction. In other outstanding novels, techniques of varied sorts, none very new, were used to consider several recurrent themes all of which had come to seem very important during the war—politics, religion, racial relationships, the war and history.

Among the novels dealing with political problems one at least was outstanding as a technical achievement—Robert Penn Warren's *All the King's Men*. This account of the rise and fall of a southern demagogue who in many ways greatly resembled Huey Long was interesting for its style and for its employment of the flashback. In addition, it had a good deal to say about problems of U.S. government and society. Less interesting technically was Upton Sinclair's old-fashioned narrative carrying along the saga of Lanny Budd, *A World to Win*. A third novel, Alfred Hayes' *All Thy Conquests*, dealt with the political problem abroad, presenting as it did a grim picture of postwar Rome during the occupation.

Books with religious themes, treating a topic quite important in U.S. fiction in late years, included Gladys Schmitt's *David the King*, Dorothy Clarke Wilson's *The Herdsman* (the story of Amos), Russell Janney's *Miracle of the Bells*, Elizabeth Hollister Frost's *Mary and the Spinners* and Donald A. Stauffer's *The Saint and the Hunchback*. Of these, the last was the most mature and rewarding.

Racial problems offered characters, plots and themes for several workmanlike novels. The problem of the Negro received consideration in the melodramatic but rather moving book *Third Ward, Newark* by Curtis Lucas and in Ann Petry's more lifelike picture of her own race in Harlem in *The Street*. Jo Sinclair's *Wasteland* was a psychological study of a Jewish family, and Arthur Miller's *Focus* was a work of real merit which made a blasting attack on anti-Semitism.

There were also a number of works by writers who, like some in the years after World War I, set forth accounts of life in the armed services. Thomas Hegen's *Mr. Roberts*, for instance, was

a collection of short stories vividly representing the tedium of war inactivity. Robert Lowry's *Casualty*, which dealt with a photo reconnaissance outfit in Italy, conveyed the boiling resentment of the G.I. William Saroyan, an older author, unfolded the tale of an American soldier in *The Adventures of Wesley Jackson*, a novel below his best achievements.

The historical novel flourished. In 1946, however, there was no outstandingly successful work in this field. The best works in this genre included *The Fields* by Conrad Richter, *The American* by Howard Fast and *Holdfast Gaines* by Odell Shepard and Willard Shepard. Less successful artistically but generally more popular were Frank Yerbe's *Foxes of Harrow*, Inglis Fletcher's *Toil of the Brave* and Theda Kenyon's *That Skipper from Stonington*.

Established Novelists in 1946.—Like Saroyan, a number of established authors were represented by novels which did not greatly add to their reputations. Examples were Theodore Dreiser's *The Bulwark*, James T. Farrell's *Bernard Clare*, Pearl Buck's *Pavilion of Women*, Charles Jackson's *Fall of Valor*, Louis Paul's *Breakdown*, Taylor Caldwell's *This Side of Innocence* and James Branch Cabell's *There Were Two Pirates*.

A number of the top-flight fiction writers of the country produced no works whatever during the year—Katherine Anne Porter, Ernest Hemingway, Sinclair Lewis, John Steinbeck, John Dos Passos, Glenway Westcott, Erskine Caldwell and Willa Cather. Several of these were readying novels which might make 1947 a better year for U.S. fiction.

Nonfiction: The Atom Bomb and the War.—In the field of nonfiction, as might have been predicted, the atom bomb, the war and the problem of international relationships loomed large.

The most widely discussed consideration of the bomb, its results and its implications was John Hersey's *Hiroshima*. This stern but quiet study of the effects of the bombing of a Japanese city upon some of its victims was first published as the contents of an entire issue of a magazine heretofore devoted to humour, *The New Yorker*. After this initial publication, it was read on many radio programs and thereafter it was published as a book which sold widely. A lucid account of the operation of the bomb was *Dawn Over Zero* by William Lawrence, the science editor of *The New York Times*. Other considerations of the problem of the bomb were George Gamow's scientific *Atomic Energy in Cosmic and Human Life* and Virgil Jordan's rhetorical *Manifesto for the Atomic Age*.

Accounts of the war were, of course, plentiful. Some were reports of correspondents in the tradition of the earlier *Berlin Diary*—Herbert Matthews' *The Education of a Correspondent*, Eric Sevareid's *Not So Wild a Dream* and Vincent Sheean's *This House against That House*. Some were historical accounts such as Walter Phelps Hall's *Iron Out of Calvary*, a compact record of backgrounds, military progress and diplomatic activities; and Charles Beard's *American Foreign Policy in the Making*, a case history of events preceding the conflict. Some were official histories—the *War Reports* of Generals Henry Arnold and George Marshall and of Admiral Ernest King. A number, written with varying degrees of objectivity, offered what purported to be "inside stories"—Ralph Ingersoll's *Top Secret*, Harry C. Butcher's *My Three Years with Eisenhower*, Captain Ellis M. Zacharias' *Secret Missions*. The war on the home front was reported in such books as Donald M. Nelson's *Arsenal of Democracy* and Jonathan Daniels' *Frontier on the Potomac*.

International Problems.—International problems were the concern of a number of authors. The general question of the relationship of the United States to the rest of the world was studied in E. B. White's readable *The Wild Flag*, in William C. Bullitt's *The Great Globe Itself* and in Sumner Welles' *Where Are We Heading?* Focussed upon particular areas or countries

were *Thunder Out of China* by Theodore White and Annalee Jacoby, *Soviet Asia Mission* by Henry A. Wallace, *Soviet Politics* by Frederick L. Schuman and *Dear Fatherland, Rest Quietly* by Margaret Bourke-White.

Neighbouring countries in the western hemisphere were the concern of others. Erna Fergusson's *Cuba* interestingly presented a bird's-eye view. Miguel Covarrubias told of life on the Isthmus of Tehuantepec in his *Mexico South*, and Neill James gave an account of the author's four year stay in Mexico in *Dust on My Heart*. Rexford Guy Tugwell offered a report on his administration in Puerto Rico and told of the problems of that country in *The Stricken Land*. Preston Everett, in *Brazil*, gave an up-to-date exposition of the geography and the economic history of an important neighbour. Most inclusive was John Armstrong Crow, *The Epic of Latin America*, an explanation of the life, institutions and attitudes of the peoples below the Rio Grande.

Domestic Problems.—A spate of books considered problems in the United States, and in a number of these, as in several fictional works, the problem of racial relationships was discussed. Dorothy M. Baruch, *Glass House of Prejudice* and Margaret Halsey, *Color Blind* argued in behalf of greater tolerance. Ellis A. Arnall, governor of Georgia, wrote on a number of southern problems, among them the problem of the Negro, in *The Shore Dimly Seen*.

Several biographies and autobiographies of contemporary leaders also necessarily touched upon domestic problems. *The Autobiography of William Allen White*, to cite one, covered U.S. history from White's point of view during the period from William McKinley to Franklin Delano Roosevelt. Josephus Daniels wrote *The Wilson Era: 1919-1923*. Alpheus Thomas Mason necessarily considered many contemporary issues in *Brandeis: A Free Man's Life*. Col. Edmund Starling, in *Starling of the White House* told of the impressions of presidents from Woodrow Wilson to Roosevelt he had gained while a secret service man.

More controversial than any of these, naturally, were a number of biographies or studies of President Roosevelt, most of them by those who were closely associated with him. Elliott Roosevelt's *As He Saw It* offered a definite interpretation and point-of-view and created much discussion in political columns and editorials. Frances Perkins's *The Roosevelt I Knew* was somewhat more objective and, in general belief, more revealing. A. M. Smith, in *Thank You, Mr. President*, told of Roosevelt as seen through the eyes of a Washington correspondent, and Ross T. McIntyre gave a doctor's report in *White House Physician*. Louis Adamic's *Dinner at the White House* analysed and interpreted not only Roosevelt but also Winston Churchill. Portions of Tugwell's *The Stricken Land*, written as they were by a man who had been both close to Roosevelt and alienated from him, impressed many as a very interesting and temperate attempt to evaluate his statesmanship.

The flood of books about U.S. sections and geographical units abated somewhat. Outstanding among those issued however were Frederick F. Van de Water's contribution to the American Lake Series—*Lake Champlain and Lake George*; Professor Donald Davidson's contribution to the Rivers of America Series—*The Tennessee*; Frank Waters' book for the same series—*The Colorado*; Walter Havighurst's consideration of the Northwest Territory—*Land of Promise*, Bruce Nelson's lively study of the Missouri valley—*Land of the Dakotahs*, Granville Hicks' study of village life—*Small Town* and Gertrude Atherton's reminiscences of a long life in a colourful city—*My San Francisco*.

Histories and Historical Biographies.—Numerically, books which concerned the Civil War stood at the top of the list of

historical works published during the year. Most ambitious of these was *Experiment in Rebellion* by Clifford Dowdey, a history of the government of the confederacy during the conflict. A. H. Bill's *The Beleaguered City* focussed upon a smaller segment of warfare from the southern point of view. The experiences of soldiers during the Civil War were recounted in John Beatty, *Memoirs of a Volunteer* and in the war letters and the diary of Oliver Wendell Holmes, Jr., edited by Mark DeWolfe Howe—*Touched with Fire*. Burton J. Hendrick surveyed the Washington scene in the war years in *Lincoln's War Cabinet*.

Wider spans were covered in a variety of books. Carl Swisher wrote an outstanding history of governmental problems and procedures in *The Growth of Constitutional Power in the United States*. Another facet of U.S. thought was covered in Joseph Dorfman's *The Economic Mind in American Civilization*. Sylvanus G. Morley's *The Ancient Maya* was hailed by critics and historians alike for its fascinating account of a civilization distant in time. History and philosophy combined in a thoughtful book, F. S. C. Northrup's *The Meeting of East and West*, which caused its author to be compared with Oswald Spengler for the scope of his survey.

Biographies dealt with varied historical figures. Nathan Schachner's *Alexander Hamilton* was a fairly objective account of the life of a man whose career, in the past, has usually been treated controversially. Edmund Fuller wrote a carefully documented, slightly fictionized biography of Frederick A. Douglas which read as well as many novels do—*A Star Pointed North*. Henry Luther Stoddard's *Horace Greeley* told of a leader in U.S. journalism during an exciting and important period of national development. Gerald W. Johnson presented an account of another great editor, Adolph S. Ochs, in *An Honorable Titan*.

Three collections of biographies told of fairly long eras of U.S. history in terms of a number of individuals. Members of the famous Lowell family of New England were considered by Ferris Greenslet in *The Lowells and Their Seven Worlds*. A Virginia family was studied in H. J. Eckenrode's *The Randolphs*. And Stewart Holbrook, in *Lost Men of American History*, presented a pageant of forgotten or obscure figures from the past—rebels, inventors, eccentrics and prophets whose experiences throw much light upon the society and the times in which they lived.

Humour.—U.S. humour during the year showed no particular trends. The type of humour which was famous in the 1920s was represented by S. J. Perelman's *Keep It Crisp*, a collection of pieces in which the comedy of free association mingled with that of burlesque and parody. Milt Gross employed the humour of diction and grammar which has amused Americans since the days of Artemus Ward in *I Shoulda Ate the Eclair*. The humour of the eccentric family which had been employed in Clarence Day's *Life With Father* and dozens of books which followed in its wake was employed by John Philip Sousa in *The Psychopathic Dog*, by Rachel Meisenhelder in *God Bless Our Aunts*, by Thelma Jones in *Skinny Angel*, by Stoddard B. Colby in *The Scholar and the Sprout* and by Robert Malloy in *Uneasy Spring*. Radio humour in which the smart turn of phrase is important figured prominently, of course, in Bob Hope's *So This Is Peace*.

Satire figured prominently in three humorous books which were widely appreciated. Eric Hodgins, *Mr. Blandings Builds His Dream House* was a wry account of the frustrations of a New York executive when he attempted to solve the housing problem. Max Shulman, *The Zebra Derby* treated the problem of the rehabilitation of the veteran with broad satire. Arthur Kober, *That Man Is Here Again* was a collection of monologues by Benny Greenspan, actors' agent, which took off the mores of the folk in the moving picture industry in Hollywood.

Poetry.—By 1919 the poetic renaissance which many asso-

ciated with the post World War I period was well under way. The movement in behalf of the "new poetry," as a matter of fact, had started several years before World War I and had continued during the war, and by 1919, such poets as Amy Lowell, Robert Frost, Vachel Lindsay, Edgar Lee Masters, Carl Sandburg and Edna St. Vincent Millay all had established their reputations. If any such movement was to be associated with World War II, critics had not yet managed to discover it.

Most of the better poetry of the year was written by poets who had displayed their wares in earlier books, and such new books as these added little or nothing to the reputations of their authors: E. E. Cummings, *Santa Claus: A Morality*; Alfred Kreymborg, *Man and Shadow: An Allegory*; William Carlos Williams, *Paterson (Book I)*; Stephen Vincent Benet, *The Last Circle*; Roy Addison Helten, *Come Back to Earth* and John Gould Fletcher, *Burning Mountain*.

Three new talents, none, to be sure, particularly novel in method or materials, highlighted the year. Most admired book by a new poet was Robert Lowell, *Lord Weary's Castle*, a collection of poems in the metaphysical tradition which was both learned in its allusions and savage in its intensity. Haniel Long, hitherto represented only by books in prose, produced, in *Grist Mill*, a collection of poems which were in a mode nearer that of the 19th century but which were quiet in tone and sure in their techniques and effects. And Elizabeth Bishop, in *North and South*, brought together a collection of poetic fantasies and descriptions which gave evidence of an intelligent mind, sensitivity of feeling and a sure control of the verse forms which she employed. American Mathematical Society: see SOCIETIES AND ASSOCIATIONS.

American Medical Association. The American Medical association included in 1946 more than 128,000 physicians who were also members of county and state medical societies. The American Medical association is governed by a house of delegates who are elected by the houses of delegates of the individual state societies. In 1945 the net income of the association amounted to more than \$1,000,000. The association had assets of property and equipment representing about \$1,500,000 and securities of about \$5,600,000, making a total of more than \$7,000,000. The association is incorporated not for profit and all its funds are devoted to promoting its objectives which, according to its constitution, are the promotion of the science and art of medicine and the betterment of public health.

The publications of the American Medical association include the *Journal of the American Medical Association* with a circulation of more than 130,000 weekly; *Hygeia*, a health magazine for the public, with a circulation of approximately 200,000 monthly; nine medical journals for various medical specialties; a complete directory of the medical profession, medical schools, libraries and hospitals, and the *Quarterly Cumulative Index Medicus*, which indexes regularly the contents of more than 1,500 medical periodicals. The association also prepares and publishes *The Standard Nomenclature of Diseases and Operations*.

Through its bureau of health education, its bureau of information and its bureau of investigation the association circulates millions of pamphlets devoted to education of the public in health, the prevention of quackery and the provision of medical care. The association in 1946 had two programs on national broadcasting chains and circulated thousands of radio transcriptions for use on local radio stations. The library of the American Medical association conducts a package library service

which sends articles and reprints to physicians on subjects of interest. The subjects most requested in 1946 were anaesthesia, heart disease, peptic ulcer, syphilis, penicillin, undulant fever and the Rh factor.

The association has a council on medical education and hospitals which is concerned with standardizing the quality of medical education, a council on pharmacy and chemistry which investigates new remedies and controls their advertising claims, a council on industrial health which establishes standards and promotes advancement in the care of workers in industry, and a council on medical service which investigates plans for medical care and encourages the growth of voluntary sickness insurance plans. There are also councils on foods and nutrition and on physical medicine. The association has aided also in the formation of Associated Medical Care Plans, Inc., which is a federation of voluntary sickness insurance plans which meet the standards of the council on medical service. The association maintains also a bureau of medical economics for studying problems related to the costs of medical care, and a bureau of exhibits for the preparation of exhibit material useful in educating both the medical profession and the public. A new activity was the establishment of a bureau of public relations. The association conducts its own printing establishment at its headquarters offices (535 N. Dearborn street, Chicago 10, Ill.) which in 1946 employed more than 700 people.

In aiding the advancement of health and medical care for the people of the United States, the association adopted the following ten-point program:

1. The American Medical association urges a minimum standard of nutrition, housing, clothing and recreation as fundamental to good health and as an objective to be achieved in any suitable health program. The responsibility for attainment of this standard should be placed as far as possible on the individual, but the application of community effort, compatible with the maintenance of free enterprise, should be encouraged with governmental aid where needed.

2. The provision of preventive medical services through professionally competent health departments with sufficient staff and equipment to meet community needs is recognized as essential in a health program. The principle of federal aid through provision of funds or personnel is recognized with the understanding that local areas shall control their own agencies as has been established in the field of education. Health departments should not assume the care of the sick as a function since administration of medical care under such auspices tends to a deterioration in the quality of the service rendered. Medical care to those unable to provide for themselves is best administered by local and private agencies with the aid of public funds when needed. This program for national health should include the administration of medical care including hospitalization to all those needing it but unable to pay, such medical care to be provided preferably by a physician of the patient's choice with funds provided by local agencies with the assistance of federal funds when necessary.

3. The procedures established by modern medicine for advice to the prospective mother and for adequate care in childbirth should be made available to all at a price that they can afford to pay. When local funds are lacking for the care of those unable to pay, federal aid should be supplied with the funds administered through local or state agencies.

4. The child should have throughout infancy proper attention including scientific nutrition, immunization against preventable disease and other services included in infant welfare. Such services are best supplied by personal contact between the mother and the individual physician but may be provided through child care and infant welfare stations administered under local auspices with support by tax funds whenever the need can be shown.

5. The provision of health and diagnostic centres and hospitals necessary to community needs is an essential of good medical care. Such facilities are preferably supplied by local agencies, including the community, church and trade agencies which have been responsible for the fine development of facilities for medical care in most U.S. communities up to this time. Where such facilities are unavailable and cannot be supplied through local or state agencies, the federal government may aid, preferably under a plan which requires that the need be shown and that the community prove its ability to maintain such institutions once they are established.

6. A program for medical care within the U.S. system of individual initiative and freedom of enterprise includes the establishment of voluntary nonprofit prepayment plans for the costs of hospitalization (such as the Blue Cross plans) and voluntary nonprofit prepayment plans for medical care (such as those developed by many state and county medical societies). The principles of such insurance contracts should be acceptable to the council on medical service of the American Medical association and to the authoritative bodies of state medical associations. The evolution of voluntary prepayment insurance against the costs of sickness admits also the utilization of private sickness insurance plans which comply with state regulatory statutes and meet the standards of

the council on medical service of the American Medical association.

7. A program for national health should include the administration of medical care, including hospitalization to all veterans, such medical care to be provided preferably by a physician of the veterans' choice with payment by the Veterans' administration through a plan mutually agreed on between the state medical association and the Veterans' administration.

8. Research for the advancement of medical science is fundamental in any national health program. The inclusion of medical research in a National Science foundation, such as proposed in pending federal legislation, is endorsed.

9. The services rendered by volunteer philanthropic health agencies such as the American Cancer society, the National Tuberculosis association, the National Foundation for Infantile Paralysis, Inc., and by philanthropic agencies such as the Commonwealth fund and the Rockefeller foundation, and similar bodies have been of vast benefit to the American people and are a natural growth of the system of free enterprise and democracy that prevail in the United States. Their participation in a national health program should be encouraged and the growth of such agencies when properly administered should be commended.

10. Fundamental to the promotion of public health and alleviation of illness are widespread education in the field of health and the widest possible dissemination of information regarding the prevention of disease and its treatment by authoritative agencies. Health education should be considered a necessary function of all departments of public health, medical associations and school authorities.

The American Medical association has consistently opposed plans for compulsory sickness insurance such as those proposed by Senators Wagner and Murray and Congressman Dingell. It has favoured, however, proposals for the extension and construction of hospitals and health centres throughout the United States, the extension of preventive medicine through the Social Security act, the establishment of a National Science foundation to encourage co-ordinated and intensified research, the widest possible development of public health facilities and encouragement to the individual states for the prepayment plans to provide medical care to the indigent and the medically indigent and for insurance against loss of wages due to illness and the costs of medical care.

The principal officers of the association following elections by the house of delegates in 1946 were: president, Harrison H. Shoulders, Nashville, Tenn.; president elect, Olin West, Chicago; secretary and general manager, George F. Lull, Chicago; treasurer, J. J. Moore, Chicago; editor of publications, Morris Fishbein, Chicago; business manager, Thomas R. Gardiner, Chicago.

The board of trustees included: James R. Miller, Hartford, Conn.; John H. Fitzgibbon, Portland, Ore.; E. L. Henderson, Louisville, Ky.; Louis H. Bauer, Hempstead, N.Y.; William F. Braasch, Rochester, Minn.; Ernest E. Irons, Chicago; R. L. Sensenich, South Bend, Ind.; Dwight H. Murray, Napa, Calif.; Charles W. Roberts, Atlanta, Ga. (M. Fl.)

American Veterans of World War II (Amvets).

This organization was founded at Kansas City, Mo., Dec. 10, 1944, by representatives of ten independent veterans' organizations from seven states and the District of Columbia, as an exclusively World War II veterans' organization.

Regular membership is open to any honourably discharged person who served in the armed forces of the U.S. or citizens in the armed forces of any ally of the U.S. between Sept. 16, 1940, and date of cessation of hostilities. Members of the

armed forces on active duty who meet the other requirements are also eligible for regular membership.

There were in 1946 more than 1,050 Amvet posts distributed over every state of the union and the territory of Hawaii; and approximately 100,000 members. National headquarters were located at 724 Ninth St., N.W., in Washington, D.C.

The Second National convention was held in St. Louis, Mo., Nov. 21-24, 1946, at which time Ray Sawyer, Arlington, Va., was elected national commander. At this time, a national program was established to expedite favourable legislation pertaining to veterans' rights and compensations and declaring a national policy and program on various national issues. The program as laid down by the convention includes the following points:

Amendment of the National Service Life Insurance act to make it equivalent in all regards with World War I insurance; the establishment of major veterans' committees in both houses of congress; establishment and protection of employment seniority rights for veterans who do not have re-employment rights under the National Training and Service act; reorganization of the Veterans' administration into a department of veterans affairs, headed by a secretary of cabinet rank; amendment of the federal constitution to enfranchise all 18-year-old citizens; legislation prohibiting the unauthorized wearing, manufacturing or sale of the World War II discharge button; enactment of federal legislation reimbursing amounts paid under state workmen's compensation laws in cases of "second injury" to disabled war veterans; additional \$500 personal income tax exemption for all taxpayers; extension of benefits under the Servicemen's Readjustment act to women who served a minimum of 90 days in the WAC, and were discharged for any reason other than their own misconduct; extension of the provisions of the act granting free cars to amputees so that it may include arm amputees, and so that the amount available to the amputee (\$1,600) may be used as part of a greater purchase price; extension of the amputee provision beyond the existing termination date of June 30, 1947; urging of the Veterans' administration to conduct its own research and purchase only highest quality prosthetic appliances; removal of on-the-job training subsistence ceilings, but increase of the authority of the administering agency to determine what constitutes a bona fide on-the-job program; increase of disability compensation and pensions automatically commensurate with periodic increases in cost of living indices as determined by the department of labour; provision of immediate optional cash redemption of terminal leave bonds; provision of dependency allowances in addition to disability compensation in cases where the veteran has dependents; provision of 15% increase in subsistence allowances for veterans receiving educational benefits under the Servicemen's Readjustment act; approval of the Acheson-Lilienthal report and the Baruch proposal for international control of atomic energy, as well as the reciprocal trade agreement program of the state department; retention of prewar immigration quota limitations; the development of an effective program of international cultural information; establishment of state labour relations committees, to meet at least monthly and study current labour problems within their respective jurisdictions; provisions to encourage research, development and action in the production of low cost rental housing, with guaranteed returns to the investor; retention of ceilings on rental housing and the \$10,000 ceiling on new veterans' housing units; legislation compelling government agencies owning or controlling surplus property and materials essential to veterans' housing to declare such property as surplus so that it may be channelled into the veterans' housing program.

(J. W. Hy.)

Amvets: see AMERICAN VETERANS OF WORLD WAR II.

Anaemia. In 1946 much attention was given to the use of folic acid (vitamin M, B₁₂, pteroyl glutamic acid, L. casei factor) in the treatment of macrocytic anaemias. After the oral or parenteral administration of 2-20 mg. of synthetic folic acid daily, an increase in the number of immature red blood cells in the peripheral blood was noted, followed by an increase in the mature forms. The therapy was effective in pernicious anaemia, and the macrocytic anaemias of sprue, pregnancy, pellagra and in gastrointestinal anaemia. A possible mechanism of action was the increase in cholinesterase after the ingestion of folic acid. Thymine (2-4-dihydroxy-5-methyl-pyrimidine) was found to have an effect similar to that of folic acid, but in larger doses (4.5-10.2 gr. daily). Megaloblastic anaemia in infancy, and pernicious anaemia in childhood responded to folic acid therapy and to liver therapy.

The relation of the Rh factor to haemolytic disease in the newborn was studied extensively. Some cases of maternal Rh sensitization without evidence of haemolytic disease in the child were reported. Rh positive blood was used successfully in the treatment of erythroblastosis fetalis. In adults with idiopathic haemolytic anaemia localized and generalized atrophy of the gastric mucosa was noted. A new type of familial congenital haemolytic anaemia in Filipinos was described, characterized by early appearance, severe symptoms, erythroblastosis, no spherocytosis, normal resistance of the red blood cells to hypotonic saline solutions, microcytosis and hypochromia. Splenectomy did not relieve the anaemia nor jaundice, but the red blood cells became large and hyperchromic. The first case of an acute febrile illness, characterized by thrombocytopenic purpura, haemolytic anaemia and generalized platelet thromboses in a male was reported.

In the military flying personnel the incidence of sicklaemia was 7.37% and there was no intolerance to lowered oxygen tension.

Rats fed on a protein-free diet developed anaemia and a reduction in the number of white blood cells. This change was prevented when 18% casein was added to the diet and corrected after it had appeared when 18% casein and folic acid were given. A diet of purified casein with sulfasuxidine produced a normocytic anaemia in a pig, relieved by liver extract.

In the anaemia of infection the plasma iron was found to be lowered, but the serum copper was increased in amount. Human or dog haemoglobin, injected intravenously into dogs with anaemia and hypoproteinaemia, was utilized in the production of new haemoglobin and plasma protein. Ascorbic acid enhanced the effectiveness of iron in relieving anaemia in children only when scurvy was present. Patients with severe scurvy had a normochromic, normocytic or slightly macrocytic anaemia, with reticulocytosis, moderate leukopenia and thrombocytopenia. Haematological and clinical improvement followed the administration of crystalline vitamin C. Molybdenum sesquioxide with ferrous sulphate was more effective than the latter alone in causing haemoglobin regeneration. Colloidal ferric hydroxide or oxide was utilized for haemoglobin production when given intravenously but was too toxic for therapeutic use. Angular fissures of the mouth and superficial glossitis, resembling vitamin B deficiency, were present in patients with iron deficiency anaemia and disappeared after iron therapy.

Of 1,500 repatriated prisoners of war, 52% showed anaemia (macrocytic, 73%; normocytic, 23%; microcytic, 4%). Some patients exposed to instantaneous doses of radiation (atom bomb) developed anaemia (1,000,000 red blood cells or less per cubic millimeter). Aplastic anaemia was reported following the use of tridione and phenobarbital, in some soldiers treated with atabrine (Quinacrine) and after exposure to products of the sulphite paper industry.

Anaesthesia. In 1946 the practice of using curare, which followed that of 1945, was expanded. There was some confusion with respect to the designation of the dose in units in contrast to milligrams. It became clear that one had better speak of the drug in terms of milligrams rather than units. Purified products were made as well as the crystalline d-tubocurarine, which was the purest and most easily used of all the products and had the virtue of being uniform.

The Centenary celebration at Boston, Mass., on Oct. 15, 16 and 17 emphasized the long and satisfactory use of diethyl ether and also the great change that had taken place in a century. At one time ether was the only good anaesthetic available but a century later no one anaesthetic could be said to be indispensable. The variety of agents available had increased the choice of anaesthetic so that one could meet most of the surgical needs as well as satisfy the wishes of the patient and his needs other than those which brought him to operation.

In one particular, a great need became evident: the lack of trained personnel for the administration of the various anaesthetic agents. Many institutions laid plans to establish departments of anaesthesiology for the purpose of making training in that field available.

The war had given hundreds of well-trained men the opportunity of demonstrating to many a surgeon for the first time in his experience what could be done by a specialist in anaesthesiology. When the surgeon returned home he carried with him the demand for this new type of service and the hospitals quickly acceded to his desire—so much so that the demand was greater than the supply of suitable personnel. This was true of medical men serving in the uniforms of a number of nations, so that there was a beginning movement all over the world for a change in anaesthesiologic methods and personnel.

Interest in the intravenous use of procaine hydrochloride increased. Procaine was used in the control of postoperative discomfort and in the relief of pruritus.

Anaesthesiologists began to pay much attention to the Rh factor in connection with transfusion of blood into their patients.

They also were concerned about the occasional case of hepatitis caused by virus infection that appeared to be introduced in the administration of solution of dried plasma. (See also SURGERY.)

Ananda Mahidol (1925-1946), king of Siam, was born Sept. 20, in Germany, son of Prince Mahidol of Songkhla. He was taken to Siam at the age of two and there received his early education. In 1933 he was sent to Switzerland where he spent most of the next 12 years as a student. After the abdication of his uncle King Prajadhipok, Ananda was proclaimed king of Siam, March 2, 1935, ruling under a regency. Although he continued studying in Lausanne, returning to his country only on brief visits, he was greatly revered by his subjects. His desire to return to Switzerland in early 1946, after one of his short sojourns at home, was thwarted by his mother, Queen Phraratanani Sri Sangwan, and powerful politicians.

The youthful monarch dutifully participated in many of the state functions while at the court, but found his greatest pleasure in playing the saxophone and riding over the palace grounds in his U.S. jeep.

In May 1946 he signed a new constitution which provided for a parliament made up of a senate and house of representatives. On June 1 he opened the first meeting of the new popularly-elected legislative body.

Less than a week later the government announced that the king and his royal party were planning to leave for Europe. On June 9, however, almost on the eve of his projected trip, the young monarch was found dead of a bullet wound in his bedroom in the royal palace. Police authorities described his death as accidental, but rumours continued to persist that he had either been murdered or had committed suicide. His brother, Prince Phumiphon Aduldet, succeeded him to the throne.

A formal report issued July 1 by a 20-man medical investigation board, including four foreign physicians, stated that King Ananda was "probably assassinated."

Anderson, Clinton Presba (1895-), U.S. government official, was born Oct. 23, in Centerville, S.D. He attended Dakota Wesleyan university, Mitchell, S.D. (1913-15), and the University of Michigan, Ann Arbor, Mich. (1915-16). Ill health forced him to give up his studies and he went to New Mexico. In Albuquerque, he worked as a reporter and editor on the *Journal* (1918-22) and later turned to selling insurance. In 1935, Anderson was placed in charge of the state's relief administration, and he was chairman of New Mexico's Unemployment Compensation commission (1936-38). In 1940, he was elected on the Democratic ticket to the federal house of representatives and was twice re-elected. Anderson's vote was divided on support of administration measures. He endorsed several domestic measures inimical to the Roosevelt administration, but on the other hand, he approved in large part the administration's foreign policy.

On May 23, 1945, President Harry S. Truman appointed Anderson secretary of agriculture, and on June 29, the president announced the transfer of the War Food Administration to Anderson's control.

In early 1946, Anderson rejected suggestions that food rationing be reimposed in the U.S. in order to alleviate world famine conditions, declaring it would prove impractical. He also favoured lifting of price controls, in opposition to Chester Bowles and Paul Porter who favoured their retention. Congress decided in Anderson's favour by inserting provisions in the new price control act (July 26) that gave the secretary of agriculture authority to act independently of other government agencies. On Oct. 10, he asked for lifting of price controls on meat; four days later (Oct. 14) most controls were lifted by President Truman's abolition of the second OPA bill.

Angling. Returns for fishing licence sales for the year were not available in January, but estimates of conservation officials placed the increase in the number of anglers in 1946 at from 10% to 25%.

The 38th annual casting tournament, held in Indianapolis, Ind., under the auspices of the National Association of Angling and Casting clubs, had a record-breaking attendance, and 6 new world records were set: Ernest Liotta set a $\frac{3}{8}$ -oz. distance bait record with a score of 407 $\frac{1}{2}$ ft.; Dick Miller made a new salmon fly distance record of 197 ft.; J. A. Halbleib cast the first perfect score of 100 in the $\frac{3}{8}$ -oz. accuracy bait; Dorothy Vogel scored 97 in Skish fly; Wilbur Brooks made a score of 82 in the Skish bait event and Charles Sutphin became accuracy baits champion with a new high score of 197.

Manufacture of fishing tackle was delayed by shortages of materials and the process of converting factories from war production back to their normal products. All items of equipment were scarce both in England and the United States.

Only one new world record fish was caught during the year. R. N. Rose took a 14-lb. spotted weakfish from Lake Worth, Fla., on Feb. 9. (T. Tb.)

Anglo-Egyptian Sudan. A territory in northeast Africa under the joint sovereignty of Great Britain and Egypt. Area: 967,500 sq.mi.; pop. (est. 1942): 6,591,000. Chief towns: Khartoum (46,311); Omdurman (117,041); Wad Medani (5,429); El Obeid (33,328); Kassala (30,026); Berber (20,000); Port Sudan (26,255); Atbara (19,757). Languages: English, Arabic and various Nilotic and Negro tribal dialects in the south. Religion: Mohammedan; south Sudan 20% Christian. Governor general in 1946, Major General Sir Hubert Jervoise Huddleston.

History.—All events in the Sudan in 1946 were overshadowed by the consultations taking place in Cairo between the British and Egyptians respecting the future status of Egypt. The future of the Sudan entered the discussions, but the British foreign secretary gave his pledge in March that no change should be made in its status before the Sudanese had been consulted "through constitutional channels." He also stated that the aim of administration in the Sudan was the establishment of self-government as a first step toward eventual independence. In the prevailing mood of excitement in the Sudan the Umma party, led by Sir Abdel Rahman el Mahdi, which stood for complete independence, persistently made its voice heard. Much rioting in Khartoum took place as a result of rumours and a statement by Sidky Pasha that the Sudan would be embodied under the Egyptian crown (*see* EGYPT). Gordon college was shut. Three thousand Umma party followers demonstrated in Khartoum in October and presented a petition to the governor calling for independence. The British foreign office paid £100,000 to the Sudan as the first instalment on the £2,000,000 to be paid over four years for improving the social services. In 1945 the Sudan had initiated a five-year plan for spending £11,500,000.

The report of the Sudan Plantations syndicate, an important cotton-growing combine, announced a dividend for 1945 of 10% and a bonus of 12%. The first quarter of the year saw heavy damage to the cotton crop from an insect pest, the *jassid*. The building of a new aerodrome at Khartoum was announced, at the intersection of the north-south and the east-west air routes across Africa. The government announced its intention of providing the capital for a company to be known as Sudan Airways. A war memorial dedicated to the forces of the Belgian Congo, who died fighting on Sudanese soil during World War II, was unveiled at Malakal. In September the Blue Nile overflowed its banks and part of Khartoum was under water. Considerable damage was done to maturing crops. The railway be-

tween Khartoum and Atbara was washed out. Thousands were made homeless in the northern province and river steamers were used to evacuate the inhabitants of the submerged islands. Relief measures were organized and food was issued to avert starvation. The proposals to make Atbara a municipality received the assent of the civil and financial secretaries. Arrangements were made for Sudanese judges to attend courses of study in Great Britain. The Sudan Medical association held its first meeting.

Education.—Elementary schools (1945) 117 (19,400 boy pupils); girls' schools 62 (6,700); technical schools 2 (221 boys); private schools 52 (6,900 boys and 3,300 girls); sub-grade and Koran schools 345 (23,000). Gordon Memorial college, students 134, excluding Kitchener school of medicine.

Finance.—Revenue £E6,578,769; expenditure £E6,529,662 (1944). Currency: Egyptian pound (£E)=413.8 U.S. cents.

Trade and Communication.—For the first six months of 1946 imports totalled £E5,787,000 and exports £E5,118,000. The principal government imports were 17,160 short tons of sugar valued at £E428,000 and 33,772 short tons of coal and coke valued at £E128,000. Great Britain contributed 20% of the imports and received 42% of the exports. India came next with 29% and 28% respectively, followed by Egypt with 18% for both imports and exports. Communications: roads for motor traffic *c.* 1,000 mi.; railways 1,991 route mi.; river service 2,325 mi.; motor vehicles licensed (1944) 3,399 cars, commercial vehicles and cycles; telephone subscribers (1945) 3,546. Telephone communication with Great Britain was re-established at the close of 1945.

Agriculture and Mineral Production.—Exported production for the first six months of 1946 (in short tons): raw Egyptian cotton 33,728; gum arabic 18,957; cotton seed 38,500. Gold production (1944): 0.062 kg. (G. A. V.)

Anthropology. The year 1946 was marked by a resumption and acceleration of anthropological activities which had been curtailed and retarded in most countries during the war years. In the United States the National Research council's committee on international co-operation in anthropology (M. J. Herskovits, chairman) continued its efforts to assemble information on the status of anthropology in countries affected by the war. In Europe the first concerted effort to re-establish contacts among anthropologists was a meeting at Oxford of the permanent council of the International Congress of Anthropological and Ethnological Sciences. Delegates from 21 countries participated in the meeting, which was arranged by Sir John Myres, permanent secretary of the congress. It was decided to hold the next full meeting of the congress in Prague in Aug. 1947. Following the Oxford meeting the Abbé H. Breuil delivered the deferred 1941 Huxley Memorial lecture before the Royal Anthropological institute on "The Discovery of the Antiquity of Man." On April 30 A. L. Kroeber delivered the 1945 Huxley lecture on the subject "The Ancient Oikoumene as an Historic Culture Aggregate." Miss Gertrude Caton-Thompson was designated Huxley Memorial lecturer for 1946.

With record enrolments in the universities and colleges, anthropology courses were expanded and teaching personnel increased. Anthropology was offered for the first time at Colgate

university, Hamilton, N.Y.; Hamilton college, Clinton, N.Y., and the University of North Carolina, Chapel Hill, and the following institutions enlarged their departments: Buffalo, Chicago, Connecticut, Cornell, Harvard, Hawaii, Indiana, Michigan, Ohio, Syracuse, Toronto, Wayne and Wisconsin. In England A. R. Radcliff-Brown retired from the chair of social anthropology at Oxford and was succeeded by E. E. Evans-Pritchard. S. Pigott became professor of anthropology at the University of Edinburgh, succeeding V. G. Childe who was appointed to the newly created chair of prehistoric European archaeology at the University of London. R. Firth assumed the post of professor of anthropology at the London School of Economics and F. Wood Jones was appointed to the chair of anatomy at the Royal College of Surgeons. In Norway, K. E. Schreiner retired as professor of anthropology at the University of Oslo and was succeeded by Jan Jansen.

George Foster became director of the Institute of Social Anthropology of the Smithsonian institution, replacing J. H. Steward who went to Columbia as professor of anthropology, where he succeeded R. Linton who accepted the Sterling professorship in anthropology at Yale. A. Metraux joined the staff of the United Nations as senior social officer in the department of social affairs.

The Museum of Anthropology of the University of Michigan announced the appointment of J. B. Griffin as director, and A. Leroi-Gouran was named assistant director of the Musée de l'Homme, Paris. In Oslo the rector of the university, D. A. Seip, resigned to become president of the Instituttet for Sammenlignende Kulturforskning (Institute for Comparative Research in Human Culture). G. Gjessing, of the institute, devoted the year to a comparative study of pictographs at research centres in the United States and Canada.

In the United States the *Yearbook of Physical Anthropology*, 1945, edited by G. W. Lasker and published by the Viking fund, made its first appearance in 1946. R. Linton assumed editorship of the Viking fund publications in anthropology, and W. B. Fagg and J. C. Trevor were appointed editors of *Man* and the *Journal* of the Royal Anthropological institute. A number of European publications which had suspended during World War II were resumed, and in France a new journal, *Le Journal de la Société des Océanistes*, was issued under the editorship of M. Leenhardt and Father P. O'Reilly. Vol. 50, nos. 1-2 of *L'Anthropologie*, covering the years 1941-46, appeared in June 1946. It contained a detailed study of the Chancelade skull by H. V. Vallois, who concluded that the skull did not show Eskimo affinities as had often been asserted. *Anthropos*, vol. 37-40, for the years 1942-45, also appeared in June 1946, carrying an article by C. C. Uhlenbeck "Ur- und altindogermanische Anklänge im Wortschatz des Eskimo." In this latest of his comparative linguistic studies Uhlenbeck presented extensive new evidence that Eskimo had been subjected to strong Indo-European influence in the remote past. This conclusion, of crucial importance in connection with the problem of the origin of the Eskimo, was accepted by the eminent Eskimo linguist, Wm. Thalbitzer, in an article "Uhlenbeck's Eskimo-Indoeuropean Hypothesis," which appeared in *Travaux du Cercle Linguistique de Copenhague*, vol. 1, 1945.

In a move to bring about closer co-ordination between the different branches of the discipline the American Anthropological association at its annual meeting in Dec. 1946 received the report of a committee (J. H. Steward, chairman) appointed to study and make recommendations concerning reorganization of the association. The committee's report was accepted and a new constitution was adopted which provided for reclassifying membership, setting up definite criteria for professional membership, and establishing an executive board of seven members, with broad powers, to work on behalf of the association between an-

nual meetings. Ruth Benedict was elected president of the American Anthropological association and Hortense Powdermaker of the American Ethnological society. The American Association of Physical Anthropologists re-elected W. M. Krogman as president.

The Viking fund announced the establishment of an annual award of three gold medals and prizes of \$1,000 each in archaeology, cultural anthropology and physical anthropology. Recipients of the prizes for 1946, selected by the representative American anthropological associations, were A. V. Kidder for archaeology, A. L. Kroeber for cultural anthropology, and F. Weidenreich for physical anthropology. In the U.S.S.R. the 1st and 2nd class Stalin prizes of 100,000 and 50,000 rubles were awarded respectively to F. S. Malkhasyan for his interpretative dictionary of the Armenian language and to B. B. Protrovskii for his archaeological and historical account of the old Vannic kingdom of Georgia. H. J. Fleure, president of the Royal Anthropological institute, received the Victoria medal of the Royal Geographical society for his researches in the human aspects of geography. Peter H. Buck, director of the Bishop museum, Honolulu, was knighted (K.C.M.G.) for his services to science and literature.

Field studies, though fewer than in prewar years, showed a marked increase in 1946. As part of the work of a joint Columbia-Yale-Smithsonian expedition to Peru, G. F. Willey and F. W. McBryde studied prehistoric and modern settlement patterns in the Viru valley and Alan Holmberg made a community study of the town of Viru. A Chilean scientific mission of nine members, sponsored by the University of Chile and directed by A. Lipschutz, conducted field studies among the Yahgan, Ona and Alakaluf of Tierra del Fuego.

Through a grant from the Arctic Institute of North America Margaret Lantis conducted psychological and ethnological studies among the Eskimos of Nunivak Island, Alaska. A. I. Halliwell, with a party of six graduate students from Northwestern university, spent two months among the Ojibwa of northern Wisconsin collecting data for a comparative study of personality under acculturation. Four anthropologists, W. R. Bascom, E. T. Hall, Jr., Leonard Mason and John Useem, participated in an economic survey of Micronesia for the U.S. Commercial company, under the direction of Douglas L. Oliver. Another research group, including John F. Embree, anthropologist, was sent out by the University of Hawaii to make a survey of anthropological, botanical, geographical and zoological conditions in Micronesia.

The Hill tribes of Burma were studied by H. N. C. Stevenson, director of frontier areas, and R. F. Fortune, government anthropologist. British anthropologists conducting field research in Africa included Mary Danielli, Madagascar; Eva Meyerowitz, Gold Coast; Phyllis Kaberry, Cameroons; and K. L. Little, Sierra Leone.

L. S. B. Leakey reported the finding of two jaws of the extinct anthropoids *Proconsul* and *Xanopithecus*, from the Lower Miocene deposits of Rusinga Island in Victoria Nyanza. G. H. R. von Koenigswald arrived in New York with all of the fossil hominid material he had discovered in Java, including the entire series of *Homo soloensis*, the *Modjokertensis* infant skull, the *Pithecanthropus robustus* and *Meganthropus* remains, as well as the *Gigantopithecus* teeth from China.

Under the direction of Stith Thompson, the Folklore Institute of America held its second summer session at Indiana university with 15 folklore specialists present. A second conference on Iroquois studies, organized by W. N. Fenton and bringing together ethnologists, linguists, archaeologists and historians on the Lower Great Lakes area, was held at Allegany State park, New York.

GIANT HUMAN TEETH and skull and jawbone fragments displayed on Sept. 19, 1946, at the American Museum of Natural History, New York city, by G. H. R. von Koenigswald, who brought them from China and Java. They were thought to be the most primitive human specimens ever discovered, dating back about 500,000 years

A number of important publications appeared in 1946. Outstanding among them were two bulletins of the Bureau of American Ethnology: *Handbook of South American Indians*, edited by J. H. Steward, and *The Indians of the Southeastern United States*, by J. R. Swanton. The handbook, vol. 1 and 2 of a 5-vol. series prepared in co-operation with the U.S. department of state, contained articles by 32 different authors and provided the first comprehensive summary of existing knowledge of the South American Indians. Swanton's volume of 953 pages assembled a vast body of information on the ethnology and history of the Southeastern Indians and represented the culmination of a lifetime of study devoted to these tribes. Two important volumes appeared under the authorship of Kaj Birket-Smith, a general handbook of ethnology, *Eine allgemeine Ethnologie*, and *Ethnological Collections from the Northwest Passage*, vol. 6, no. 2 of the Reports of the Fifth Thule expedition. The latter, a detailed description of the material culture of the central Eskimos, concluded with a further exposition of the author's views on the origin and relationships of Eskimo culture. Margaret Lantis' *The Social Culture of the Nunivak Eskimo* was the first complete and scientific study of the social culture of any Alaskan Eskimo group. *Outlines of the Geography, Life and Customs of Newfoundland-Labrador*, by the Finnish geographer V. Tanner, included a comprehensive study of the Labrador Indians, Eskimos, and whites.

In the field of linguistics a notable work was *Linguistic Structures of Native America*, no. 6 of the Viking fund publications in anthropology, containing 14 articles by H. Hoiyer and others. Another important linguistic contribution was Leslie Spier's

Comparative Vocabularies and Parallel Texts in Two Yuman Languages in Arizona, issued by the University of New Mexico.

In *Apes, Giants, and Man*, F. Weidenreich described the new fossils from Java and China which form the basis for his revolutionary theory that man's earliest ancestors were giants. Another work that held important implications for human phylogeny was *The South African Fossil Ape-Men—The Australopithecinae*, by R. Broom and G. W. H. Schepers. In this memoir of the Transvaal museum the authors presented new evidence that *Australopithecus*, *Plesianthropus*, and *Paranthropus*, whose teeth and limb bones exhibit a remarkable blend of hominid and simian features, should be assigned to the Lower or Middle Pliocene rather than the Lower Pleistocene.

Among other important works that appeared in 1946 were *Cheran: A Sierra Tarascan Village*, by Ralph L. Beals; *From Savagery to Civilization*, by Grahame Clark; *What Happened in History*, by V. G. Childe; *Heredity, Race, and Society*, by L. C. Dunn and Th. Dobzhansky; *Suye Mura, a Japanese Village*, by John F. Embree; *Human Genetics*, by R. R. Gates; *Malay Fishermen: Their Peasant Economy*, by R. Firth; *The Last Trek of the Indians*, by Grant Foreman; *Water Transport: Origins and Early Evolution*, by J. Hornell; *Caste in India*, by J. H. Hutton; *Legends and Cults in Ancient China*, by Bernhard Karlgren; *Delaware Culture Chronology*, by Vernon Kinietz; *Warriors Without Weapons*, by Gordon Macgregor; *The Eastern Timbira*, by Curt Nimuendajú, translated and edited by R. H. Lowie; *Primitive Education in North America*, by G. A. Pettitt; *Not by Bread Alone*, by Vilhjalmur Stefansson; *Dating the Past: An Introduction to Geochronology*, by Frederick E. Zeuner.

Antimony. The salient features of the antimony industry in the United States during late years are indicated in the table.

Data of Antimony Industry in the U.S., 1940-45

	(Short tons)					
Production	1940	1941	1942	1943	1944	1945
In ore	494	1,214	2,944	5,556	4,735	1,930
In alloys*	2,077	2,958	3,267	2,085	2,857	1,992
Imports	16,216	27,504	21,474	29,969	17,761	24,649
In ore	15,733	19,386	20,946	28,755	17,080	22,643
Metal	209	7,469	127	932	293	627
Other forms†	274	649	401	282	388	1,379
Consumption, primary	17,955	29,994	23,852	19,508	23,756	25,761
Secondary recovery	11,421	21,629	18,200	15,483	15,886	17,148

*Antimony content of antimonial lead produced from foreign and domestic ores.

†Estimated antimony content of alloys, oxide and liquated sulphide.

Production of metal from straight antimony ores was largely from imported ores; most of the domestic recovery was from concentrates separated from complex ores of antimony and gold, mercury, copper, or tungsten, or from lead-antimony ores that went to smelters of antimonial lead. The easing of war demand, combined with low prices and increasing costs of production, shut down several of the smaller smelters, and in 1946 the shortage became as acute as at any time during the war years—so much so, in fact, that it became difficult to supply storage batteries for automobiles.

Output was also heavily cut in the countries supplying ore imports to the United States, especially Bolivia and Mexico, and there was little prospect for improvement except through increased prices.

(G. A. Ro.)

Anti-Saloon League of America: see SOCIETIES AND ASSOCIATIONS.

Anti-Semitism. The world stood an excellent chance in 1946 of permanently eliminating overt anti-Semitism. More subtle forms might then also eventually disappear.

Despite Hitler's attempt to indoctrinate the occupied nations of Europe, Jews were slowly beginning to rebuild and re-integrate their lives. There was little talk of a "Jewish" problem in Belgium, the Netherlands, France or the Scandinavian countries. The population of Jews in these countries had been decimated. But freed of nazism, these traditionally liberal states reverted to their prewar pattern of life in which Jews found full equality of rights and responsibilities.

Italy, which had yielded only reluctantly to nazi pressure during the war, also reverted to its liberal treatment of Jews. In 1946 Italy welcomed new citizens of Jewish faith and offered all refugee Jews, stranded in Italy, opportunity to acquire Italian citizenship.

Czechoslovakia and Austria were bright spots in middle Europe. While in both countries restitution of property presented a more difficult problem where Jews were concerned than for those not of Jewish faith, on the whole anti-Semitism seemed to have passed with the collapse of nazism. Czechoslovakia offered Jews equal rights as individual Czech citizens. The country abolished all recognition of minority group rights and called for an abandonment of Zionism (Jewish Nationalism) as a part of the general program. But individual Jews who wished integration as Czech citizens were secure. Conditions in Austria had improved so that several thousand Jews attempted to return there from Palestine.

It was in eastern Europe, exclusive of the U.S.S.R., where anti-Semitism seemed to be indigenous and continued even after nazism's collapse. Poland was the scene of a pogrom in the

EUROPEAN JEWS in Palestine in 1946 still wore the Shield of David on their coats—a badge of shame in nazi concentration camps, a badge of honour in Palestine

summer of 1946. There were sporadic reports of mistreatment of Jews all during the year in Poland. Polish Jews seemed determined to leave the country and streamed across Europe to the U.S. occupation zone in Germany. Rumania, Hungary and Bulgaria, where a major percentage of Europe's surviving Jews lived, were still uncertainties in 1946. If they remained in the soviet orbit, it was likely that anti-Semitism would be forcibly eliminated in legal fashion as in the soviet. Eastern Europe therefore was a question mark, hidden behind the veil of soviet control. Yet, it probably held the key to the future of virulent anti-Semitism on the continent.

Two new trouble spots appeared in 1946 as a result of the attempt to claim Jewish national rights in Palestine. The Arab world became violently anti-Zionist. There was danger that this feeling might become anti-Jewish.

The same Palestinian crisis had its impact in England. British soldiers were killed in Palestine by Zionist terrorists, and in the summer British government headquarters in the King David hotel in Jerusalem were bombed, with a heavy loss of life. There was the serious possibility that in England, too, anti-Zionism might boil over into anti-Semitism. It was already noticeable in the British army as a result of the conflict in Palestine.

Latin America seemed relatively free of anti-Semitism. Brazil, Venezuela, Mexico, the Dominican Republic, were offering immigration opportunities to the displaced Jews of Europe or were being discussed as possibilities for such immigration.

In the United States the prewar anti-Semites failed to make a comeback during the most chaotic period of reconversion. Liberal forces seemed on the offensive against anti-Semitism. The Ku Klux Klan was banned in a number of states, among

them Georgia, where it had had its renaissance in the 1920s. Several states passed Fair Employment Practice codes. One benefit of such codes was a partial elimination of economic discrimination against Jews. There were numerous organized cooperative efforts enlisting Jews and Christians to root out anti-Semitism and eliminate it. There was a general awareness that anti-Semitism was a social malady that destroyed all society and could not be confined to disabilities for Jews.

Two thousand years during which anti-Semitism had existed cautioned against overoptimism. Yet, religious fanaticism was no longer a major force. The Hitlerian racial theories had been discredited. The peace that was still undefined and unfinished in 1946, therefore, held the answer to the future of anti-Semitism. If it recognized and encouraged a fragmented world, with segregation of all kinds of groups, anti-Semitism would be one friction caused by such policies. If the peace was to be broad and move nations and their people toward integration, anti-Semitism would be diminished by the degree to which such a peace obtained. Its rise had been part of world disintegration before 1946. It had reached a low ebb, in the over-all picture, in this year of transition. It would ebb out slowly or mount to new furies beyond 1946, depending upon democracy's ability to win the peace of the war it had so mightily won. (See also FASCISM; JEWISH RELIGIOUS LIFE; REFUGEES.) Antonescu, Ion (1882-1946), Rumanian soldier and statesman, was born on June 2 in Transylvania. He fought with the Rumanian armies in World War I and served as military attaché in his country's embassies in London and Rome after the war, later rising to chief of the army's general staff and war minister. German demands on Rumania early in World War II led to serious internal disorders and King Carol was compelled to offer the premiership to Antonescu, whose pro-Nazi sentiments were public knowledge. On taking office Sept. 5, 1940, he promptly forced Carol's abdication, established a totalitarian regime and ruled as an absolute dictator. Under Antonescu Rumania became a German puppet state and on June 22, 1941, he joined Hitler in declaring war on the Soviet Union. Rumanian armies, simultaneously with the German forces, invaded Russia; Antonescu assumed the title of generalissimo and commander of Rumanian armies in Bessarabia. During the Soviet counterattack which penetrated Rumania in 1944, Antonescu was arrested by King Michael I, who had succeeded his father Carol to the throne, and in Sept. 1944, Antonescu and other Rumanians accused of active collaboration with the Nazis were turned over to Soviet military authorities.

On May 17, 1946, after a ten-day trial in a Rumanian people's court, Antonescu and 12 of his associates were convicted on charges of war crimes and sentenced to death.

Both the Rumanian supreme court and King Michael refused his appeal for clemency and Antonescu was executed on June 1.

Aquariums. The outstanding aquarium event of 1946 was the reopening of Marineland, St. Augustine, Fla. This oceanarium was first able to equip and fill one of its two enormous tanks early in the year and later the other

was completed with its wide selection of local marine fishes and porpoises.

The aquarium of the London, England, zoo, was reopened during the year with a modest collection, but no others closed by the war were re-established.

Neither did any of those prepared in plan materialize, although there was a trend toward the use of such institutions for the study of fishes in general, with the view of conserving the last big natural resources of all countries—the oceans and their contents.

In only one major live-fish exporting country, Brazil, had collectors re-established themselves, but the fishes so far available were not of the species a large aquarium could use for its basic exhibits, most of the stock being mainly suitable for small domestic aquaria. These were all taken immediately by fanciers, however. (C. W. C.)

Aqueducts. Artificial waterways are essential in the development of the western rivers of the U.S. to provide irrigation, municipal and domestic water supplies, flood control and power. Up to 1946 the bureau of reclamation in the department of the interior had developed, designed and constructed many projects to conserve and wisely utilize the rivers and water resources in the 17 western states. It had built more than 15,000 mi. of main canals, more than 100 mi. of tunnels and had placed more than 13,000,000 ft. of pipe.

During 1946 the 71-mi. long San Diego aqueduct designed by the bureau had been more than half completed by the navy department. It was to connect with the Metropolitan Water district's 241-mi. Colorado River aqueduct near San Jacinto, Calif., and when finished would carry up to 50,000,000 gal. of Colorado river water daily to San Diego. The placement of precast concrete pipe varying from 48 to 96-in. in diameter and the excavation of 7 tunnels was in progress.

The 41-mi. long Salt Lake aqueduct on the Provo River project, Utah, was more than half completed by the bureau. It was to transport 150 second ft. of water from Deer Creek reservoir, located 16 mi. northeast of Provo, to the vicinity of Salt Lake City, where the water would be used for industrial, domestic and irrigation purposes. Completed portions totalled 23 mi. in length and included the 6½-ft. diameter Olmstead tunnel, the 3-mi. Alpine-Draper tunnel and 19½ mi. of 69-in. diameter precast concrete pipeline. The fabrication and placement of plate-steel pipeline at high pressure sections were under way.

Aqueduct construction on the bureau's Colorado-Big Thompson project involved the completion of the 13-mi. Alva B. Adams tunnel, "holeing through" of the 10-ft. diameter 1.3-mi. Rams Horn tunnel and excavation work on the 12½-ft. diameter 1.1-mi. Prospect Mountain tunnel and on the 10¾-ft. diameter Aspen Creek siphon. These structures between Estes Park and Grand Lake, Colo., would convey Colorado river water from the western slope of the Rocky mountains to the Big Thompson canyon on the eastern slope for power production and supplemental irrigation of 615,000 ac. of fertile farm land in northeastern Colorado.

Construction was completed or under way on 115 mi. of the 145-mi. long Coachella canal which branches from the All-American canal 18 mi. east of Yuma, Ariz., and extends northwest as far as Indio, Calif. It was to convey 2,500 second ft. of water to irrigate 75,000 ac. of land in the Coachella valley.

On the bureau's multimillion-ac. Central Valley project in Calif., the 47-mi. long Contra Costa canal for furnishing irrigation, municipal and industrial water supplies to the bay region of the Central Valley was rapidly nearing completion; the 160-mi. Friant-Kern canal which would assist the completed Madera canal in carrying water from Millerton lake at Friant dam to

the fertile San Joaquin valley was under construction to mi. 73; the Delta-Mendota canal for conducting water upstream along the San Joaquin river and into the river again at Mendota, Calif., was under construction for a distance of 24 mi.; and the 50-mi. Delta Cross channel for diverting Sacramento river water to the San Joaquin river was scheduled for early construction.

The construction of water conductors was initiated by the bureau on the Columbia Basin project for transporting Columbia river water stored in Lake Roosevelt at Grand Coulee dam to irrigate 1,000,000 ac. of land in central Washington. The work included 13 mi. of the largest irrigation canal in the Pacific Northwest; 6½ mi. of the West canal, a branch of the main canal; the 2-mi. Bacon tunnel and the 1,020-ft. Bacon siphon which are 23-ft. in diameter; and two 25-ft. diameter siphons on the West canal. (See also CANALS AND INLAND WATERWAYS; DAMS; TUNNELS.) (M. W. Ss.)

ARA: see AGRICULTURAL RESEARCH ADMINISTRATION.

Arabia. A peninsula of c. 922,800 sq.mi.; population (est.) 10,084,000. It consists politically of two independent Arab states, Saudi Arabia and Yemen, of the nominally independent sultanate of Oman and Muscat (Masqat), of the territories of the Trucial sheikhdoms of Oman and Qatar (British protectorates), of a nominally independent sheikhdom of Kuwait and of the colony and protectorate of Aden (*q.v.*). Language: Arabic; religion: Mohammedan. Rulers: Saudi Arabia, King Abdul-Aziz ibn Abdurrahman al-Faisal Al-Sa'ud; Yemen, Zaidi Imam Yahya ben Muhammed ben Hamid ed Din; Oman and Masqat, Sultan Sayyid Sa'id bin Taimur; Kuwait, Sheikh Ahmad ibn Jabir al Subah.

History.—On a state visit to Cairo in January King Ibn Sa'ud told Palestinian Arabs that the question of the Arabs and Palestine was a question for Islam in all Arab countries. On returning home Ibn Sa'ud declared that Egypt was "truly the example and hope of all Arabs" and advised all Arabs to rally round the Arab league. This league tended to become representative of the Arab upper classes rather than of the masses.

After publication of the Anglo-American report on Palestine an Arab rulers' conference at Cairo was attended by Emir Faisal of Saudi Arabia, King Abdullah of Transjordan, Emir Yahya of Yemen, Emir Abdul-Ilah, regent of Iraq and the presidents of the Syrian and Lebanese republics. On May 30 it was announced that the Arab kings and presidents would oppose any further immigration into Palestine. They hoped that the cordial relations between the Arab nation and Britain and the U.S.A. would not be disturbed by the insistence of the latter on measures affecting the rights of Palestine Arabs, since any disturbance in that country would be a threat to world peace.

The American-Arabian Oil Company (jointly owned by the Texas Company and Standard Oil Company of California in equal parts) agreed to an extension of its pipeline across Saudi Arabia from the Persian gulf to Egypt, and to the building of a new refinery at Suez or Alexandria. The Transcontinental and Western Air Inc. (of America) opened negotiations with Ibn Sa'ud for a civil aviation agreement. Saudi Arabia received a loan of £6,250,000 from the Export-Import bank.

(R. F. O. B.)

Finance.—The monetary unit in Saudi Arabia is the Saudian rial. Exchange rate, 1942: 1 rial=Rs. 1 (Indian)=30.12 U.S. cents.

Trade.—With Great Britain: (1945) Saudi Arabia and Yemen, imports £17,000; exports £94,000; (1938) Oman and Masqat, Trucial sheikhdoms and Kuwait, imports £40,262; exports £18,354. Saudi Arabia exports: skins, wool, gold, charcoal, cattle, dates, clarified butter, gum. (See also ARAB LEAGUE.)

Arab League. The League of Arab States (*Jāmi'at al-Duwal al-'Arabīyah*) came into existence at Cairo on March 22, 1945, when seven independent states signed a pact safeguarding the sovereignty and independence of each and promising mutual co-operation. These states were Syria, Trans-Jordan, Iraq, Saudi Arabia, Lebanon, Egypt and Yemen. The aim of the league, as stated in the pact, is "to strengthen the close relations and numerous ties which link the Arab states" and "to support and stabilize these ties upon a basis of respect for the independence and sovereignty of these states and to direct their efforts toward the common good of all the Arab countries." At the insistence of Lebanon, the only Christian state in the league, the right of each member to adhere or secede from the organization was recognized. The door was left open for other Arab states to join as they win their independence. In an annex to the pact "the independence of Palestine in the legal sense" was proclaimed and the league took upon itself the right of appointing an Arab representative for Palestine "until the country can effectively exercise its independence."

The pact provides for a council, several committees and a secretariat general. It makes Cairo the permanent seat of the league but authorizes the council to hold its sessions elsewhere. An Egyptian, 'Abd-al-Rahman 'Azzam Bey (later Pasha) was appointed secretary general. The council is composed of representatives of the Arab states, each one of which has one vote only. The council is entrusted with the task of carrying out the purposes of the league and collaborating with any international organizations to guarantee peace and security. The committees of the league study and report on matters of common interest including economic and financial problems, communications, cultural affairs, nationality, social welfare and public health.

The pact forbids resort to force in the settlement of disputes between member states. In case of aggression or threat of aggression, the league, at the request of the threatened member, takes whatever measures it deems necessary.

The league came as a culmination of prolonged attempts at co-operative effort for mutual benefit among Arab states going back to World War I. World War II introduced the Zionist problem and the mandatory system and enhanced Arab nationalism and the desire for collaboration. In a speech on May 29, 1941, British Foreign Secretary Anthony Eden declared that "His Majesty's Government will give full support to any scheme" that the Arabs may desire for "a greater degree of unity than they now enjoy." On Feb. 24, 1943, he declared, "As I have already made plain the British Government would view with sympathy any movement among the Arabs to promote economic, cultural, or political unity, but clearly the initiative in any scheme would have to come from the Arabs themselves."

The initiative came from Egypt. Its prime minister, Nahas Pasha, soon after that invited the various Arab governments to send representatives to Cairo for consultation. Iraq, Trans-Jordan and Syria showed the largest measure of enthusiasm. Lebanon was not prepared to go as far as these neighbours by way of federation or union. Saudi Arabia was hesitant, suspicious that Iraq, Trans-Jordan and Syria might form a bloc against that country. Egypt, which until then had developed no keen interest in any Pan-Arabic movement, contributed to overcoming the early difficulties in the way of organization. As the largest, richest and strongest of the Arab states Egypt now aspired for a position of leadership in Arab affairs.

The rising feeling of solidarity among the Arab countries, even before they were organized as a league, was manifest in the Franco-Lebanese crisis of Nov. 1943. During the Franco-Syrian crisis of May-June 1945 the council of the league declared France the aggressor, supported the demand of Syria and Lebanon

ARAB LEAGUE LEADERS, assembled in Cairo, Egypt, on May 28, 1946, to organize opposition to Jewish immigration to Palestine. Left to right, Seif al Islam Abdullah of Yemen, Sheikh Bishara el Khoury, president of Lebanon, President Shukri el Quwatli of Syria, King Farouk I of Egypt, King Abdullah of Transjordan, and Emir Saud, crown prince of Saudi Arabia

for immediate evacuation of French troops and promised aid. In June 1946 the council held a session in Bludhan, Syria, to frame replies to the United States and British governments, which had raised questions about the possibility of admitting 100,000 Zionists to Palestine. All the states took a firm stand against any further immigration into Palestine. (See also ZIONISM.)

Archaeology. **Eastern Hemisphere.**—Archaeological activity, in 1946, was getting ready, but was not quite going. On-the-spot organizations, such as the various national departments of antiquities, were busy, but the anticipated postwar burst of activity had not yet begun.

So far as reports were available, no highly spectacular discovery was made during 1946, although several very important contributions to archaeological and historical knowledge did appear. One of the most provocative of these was the information on a Roman trading establishment in India. At this site, Arikamedu, on the southeast coast of India, in the tiny French holding at Pondicherry, the French authorities generously gave permission to excavate to the Archaeological Survey of India. The spirit in which this excavation was accomplished, and the historic sense of the extent of the Indo-Roman economic relationships which it calls up, augured well for the coming new phase of archaeology.

The most important find of Palaeolithic material reported in the year was L. S. B. Leakey's Acheulean "camp sites" at Olor-

gesailie, Kenya, Africa (*Antiquity* xx). Only the latest aspects of the widespread Acheulean facies had been found on actual living floors. The earlier Acheulean type of flint tool has always appeared in geologically redeposited beds. The Olorgesailie sites lie on old land surfaces which later became interbedded between layers of lake sediments, but the original human disposition of the camp sites is said to be undisturbed. The animal bones of the Olorgesailie sites are of extinct species of elephant, hippopotamus, giraffe, pig and baboon—the latter two of giant size. This fauna is assessed as middle Pleistocene.

Leakey reported round stone balls, often found in sets of threes, which he interpreted as bola stones. Bolas are thong-connected groups of stones, used to hurl at the legs of running animals so as to entangle and trip the prey, which can then be finished off with a club. These, taken with the Acheulean type hand axes and cleavers, were the only tools reported—flake tools were not mentioned. Fire was not evidenced, nor graves. The bones of the animals were usually found in a split condition, and their skulls had been smashed—presumably the hunters sought the marrow and brains as well as the meat of their prey.

Europe.—The year's discoveries in Britain were more in the way of detailed substantiation of materials already known, than of spectacular new finds. The *Illustrated London News* showed newly recovered Neolithic sacred circles of Windmill Hill context, and also accounted for several occurrences of tessellated pavements and mosaics of Roman times and of Romano-British pottery. The great circular structures or "henges" of England are usually associated with Early Bronze Age materials. Information appeared on one remarkable find, a treasure of Roman silver plate. This treasure was turned up by a farmer while plowing, near Mildenhall, Suffolk, England. The treasure included trays, dishes, bowls, spoons and detached

handles. The trays are especially handsome examples, with mythological scenes worked in relief as ornamentation. The treasure probably was the plate of a Roman household of the 3rd century A.D.

The investigation of prehistoric archaeological sites in France was being continued. An excellent résumé of accidental discoveries and clearances made during the occupation appears in the *Proc. Prehist. Soc.*, XI. Among the available notes on post-occupation activities is one concerning drawings of animals (of a temperate climate), discovered on the walls of a cave at Ebbo, Ardèche. The Abbé Henri Breuil assessed this art as Aurignacian.

L'Anthropologie, L, contains a final report, with commendable detail, on the original excavations at the rock shelter of Laussel, France. This journal also has much news of the various fates of archaeological collections, museums and personalities during the war.

The post-Pleistocene occupation of a large rock shelter near Gramat, Lot, France, was reported. The shelter contains six upper layers of Tardenoisian type, and one of Sauveterrian at the base of the deposit. It seemed probable that the uppermost Tardenoisian layers were occupied at a time when Neolithic and possibly even later industries flourished nearby.

Sculpture of the Gaulish tribe of Salians, who lived near Aix in Provence, France c. 400-123 B.C., was found by the Germans during World War II. The Salians imprudently attacked the Romans in 179 B.C., and in 123 B.C., Gaius Sextius Calvinus wiped them out and destroyed their capital. The sculpture, of human heads and torsos, shows the traces of the Roman hammers which broke them up.

Antiquity, xx contains an important report by G. Bersu on a late bronze and iron age hill-fort in Switzerland. The site is the Wittnauer Horn, a long narrow promontory, with naturally steep slopes save for the gentle rise on the neck of land which connected it to a plateau. The fortification of the promontory consisted of building a great rampart across the neck, thus increasing the slope at this point to a high angle like that of the natural steep slopes on the other sides of the promontory. Bersu explains why the rampart was not built with a vertical face. The warfare of the Hallstatt A-B phase was carried on with sling stones, and dead ground at the base of a vertical wall would have been an inconvenience to the defenders.

The floors of the houses on the Wittnauer Horn were in part cut into the rock of the perimeter of the promontory, and in part built up on platforms facing out over the slope. The wooden beams of the platforms projected far enough out over the slope so that a defensive parapet ran around the promontory slopes, outside of the houses.

The Wittnauer Horn village seems to have contained a community of people of equal social standing, who lived in much the same way as did the Swiss lake dwellers. In fact, it was believed that the two types of sites were connected culturally. The bones of the various domesticated animals were of the same breed as those known from the latest bronze age lake dwellings and the pottery is identical. It even appeared that the same catastrophe which brought the lake dwellings to an end resulted also in the destruction of the Wittnauer Horn.

The *Illustrated London News* contains Prof. K. Absolon's description (the first detailed one yet made) of his grandfather's remarkable discoveries in the cave of Byči Skala in Moravia. Knowledge of the earlier range of the deposits in the cave are supplemented by Absolon, who excavated a nearby site in 1922 and 1939. A primitive Aurignacian, a Gravettian and a long Magdalenian occupation are accounted for. Then, after a hiatus, represented in the cave section by a sterile travertine layer,

FIVE CYLINDRICAL STRUCTURES, hollow and made of mud bricks, were found in excavations at Helwân, near Cairo, Egypt, which by 1946 had revealed more than 4,000 tombs

comes a sequence of Neolithic to iron age antiquities. The item of greatest interest is the iron age deposit, of about 600 B.C. At first the cave was the workshop of a blacksmith who made iron rings (analysis had yet to prove these were cast; if they were, it would be the earliest use of this technique in ironworking in Europe). Then the blacksmith seems to have been dispossessed, for the cave became the scene of a chieftain's burial.

As in a much earlier case in the royal tombs at Ur, in Mesopotamia, this chieftain was conveyed to his cave-tomb, and laid at rest in a wheeled wagon. About him, numerous retainers were slaughtered to serve him in the hereafter; all but 5 of some 40 skeletons were those of young women. Many animals and great quantities of grain were also deposited with the dead, also a fine variety of ornaments and implements of late Hallstatt iron age type. The pyre was then burned, and the site heaped with stones. The find supplies a remarkable insight to the stage of culture in central Europe at the same time when Greek civilization was beginning to flourish.

S. P. Tolstov, director of the Institute of Ethnology of Moscow, U.S.S.R., has reported (in *Antiquity*, xx) on the Russian excavations at a site in the Kizil Kum desert, in Transcaspia. The site, called Janbas Kala no. 4, contained traces of a large wood and thatch communal enclosure of polygonal form, roofed at least in part, and with a central and subsidiary hearths. The site contained pottery with stamped and scratched ornaments; flint blades, chisels and points including blade-tool micro-liths; and simple pointed bone tools. The bones of wild boar, deer, turtle and of many birds occurred, also great quantities of fish bones. Tolstov believed that his site must not be

later than the beginning of the 3rd millennium B.C.

In H. Field's list of the immediately prewar archaeological activity in Russia (*Am. Rev. of the Soviet Union*, vii-4), it also appeared that about 30 expeditions took the field in the 1945-46 season. No details of their activities were known up to the end of 1946.

Work was being resumed by the various national schools in both Greece and Italy. U.S. field parties were "cleaning house" on the sites of their prewar excavations at the Athenian Agora and at Corinth, but no details were available as to results. A complete Roman cemetery, with pagan and early Christian tombs—for some of which the family names survive—was discovered during the lowering of a floor in crypts under St. Peter's, in Rome.

Near East.—For most of the near east, the still troubled political situation prevented the resumption of large-scale excavations by western European and U.S. excavators. The Oriental institute's epigraphic work at Luxor in Egypt was resumed, and several British and French parties were in the field, but details of their findings were not known.

K. Erguvanli's note (in the *Belleten*, x) adds to the growing information on the Palaeolithic in Turkey. The note accounts for several convincing core-bifaces of Acheulean type, and some utilized flakes, from the district northwest of Gaziantep in the Anatolian highlands. Early in the year, news also came of H. Th. Bossert's discovery of late Hittite sculpture in the same general area.

Information on Syria and Palestine was scanty, but word reached the United States that substantial clearances of important materials in the early bronze age range of Palestine were made late in the year. The work of the Jewish Palestine Exploration society at Khirbet Kerak and of the École Biblique et Archéologique Française at Tell el-Fâr'ah was believed to be especially important. N. Gleuck's intensive survey of early bronze age and Chalcolithic sites in the Jordan drainage continued. Clearance of graves from a ridge near Tel Aviv, Palestine, yielded pottery ossuaries containing human bones and pottery vessels of the type known at the sites of Ghassul and Hadera. This material probably goes back to the beginning of the 4th millennium B.C.

P. Dikaïos, curator of the Cyprus museum, reported interesting copper age finds from the sites of Ambelikoú and Philíá on Cyprus. At both sites there were remains of settlements of the 3rd millennium B.C., and some tombs appeared at Philíá. On the second of two areas at Ambelikoú, evidence of copper working was said to have been found. This was important, for while Cyprus is suspected to have been a great source of ancient copper in later times, no copper workings earlier than the end of the 2nd millennium B.C. had yet been found.

In Egypt, the traces of a prehistoric village establishment, apparently quite similar to that at Merimdeh, were reported from el Omari near Helwân. Plain and burnished pottery appeared, also flint work recalling that of the Fayum, silos, emmer wheat and barley, and a fauna with some apparently domesticated forms.

Somewhat more spectacular work was also carried on at Helwân, by Zaki Bey Saad of the Egyptian Department of Antiquities. Zaki Bey's excavations, in the fourth year of their sponsorship by King Farouk I, concerned some 4,000 graves of the 1st and 2nd Egyptian dynasties. The excavator believed there might be some evidence to indicate a pre-1st dynasty (*i.e.*, a zero dynasty) range. All of the tombs so far exposed were plundered in antiquity; in one case, the skeleton of a man trapped by a falling stone is identified by his water jar and lamp as a grave robber of Roman times. These excavations were expected to add much detail to existing knowledge of the

time of birth of the Egyptian state.

Another important tomb discovery of the 1st Egyptian dynasty, reported by E. Drioton, director of the Department of Antiquities, was made at Sakkāra. This tomb, in which the seal of Queen Mer Nith was found, was said to be the largest royal tomb yet discovered for the 1st dynasty. It seems to have been looted as early as the 2nd dynasty.

Important architectural clearances of the city walls and gates of mediaeval Cairo were made by the Egyptian Department of Arab Antiquities.

The directorate-general of antiquities of the Iraq government continued its fine record of excavations with the clearance of Tell Harmal, near Baghdad. Taha Baqir reported in *Sumer* on the site, which yielded the architectural remains of a fortified enclosure with a single entrance. Buildings of a public character and a large temple appeared within the enclosure; the whole complex dates to the earlier part of the 2nd millennium B.C. Life-size terra-cotta lions flanked the entrance and sanctuary doors of the Tell Harmal temple. The temple itself was an impressive building with niched walls. Some 1,300 cuneiform tablets—lists, salary records, inventories, etc.—go together with other evidence to suggest that Tell Harmal was the administrative centre of an agricultural district in early Babylonian times.

Splendid panels of 'Abbāsīd carved brickwork appeared, when renovations were being undertaken on the Mirjan mosque in Baghdad. The building was being made into a national monument.

India.—The year saw the appearance of three articles on early materials from the Baluchistan-Indus area of northwestern India. One of these articles was general; Stuart Piggott, "The Chronology of Prehistoric Northwest India," *Ancient India*, i. Piggott makes an assessment of the chronological positions and early interrelationships of the earliest village horizons in the area, and also indicates the discovery of one or more types of pottery which are pre-Amri. The Amri material was the earliest known village material of the Indus valley, and did not seem to go back before 3500 B.C.

TOMB EXCAVATED AT HELWÂN, near Cairo, Egypt, and thought to be more than 5,000 years old, was discovered in a project which, under the sponsorship of King Farouk I of Egypt, completed its fourth season in 1946

The second article on the northwest Indian area was the report of an unusually intelligent amateur, the late Brigadier E. J. Ross of the British army, on clearances made by him at Rana Ghundai in Baluchistan (*Journal of Near Eastern Studies* v). In his "Prefatory Remarks" to the Ross report, D. E. McCown of the Oriental institute synthesizes the Rana Ghundai finds with Piggott's Indian study and with the archaeological materials of Iran and Mesopotamia. McCown was, at the close of the year, in India, and on his return was to collaborate with Piggott in a joint report; for the moment, the separate McCown and Piggott studies cited above form an up-to-date analysis of current knowledge of late prehistory in the Baluchistan-Indus area. The Rana Ghundai material itself forms an important link in understanding the connection between northeastern Iran and the Indus. The site yielded at one point a very handsome black-on-red pottery with animal motifs as painted decoration.

The third article concerns the time of the full flower of the Indus civilization of the 3rd millennium B.C., when great urban centres supported clever craftsmen in pottery, sculpture and metalworking, and writing (in 1946 still undeciphered) was known. After its discovery in 1922, the clearances made in cities of the Indus civilization had in no case yielded traces of fortifications or city walls. It was sometimes supposed that here was a case of a peaceful utopian kind of state, much different from the contemporary situations in ancient Egypt and Mesopotamia. New work by R. E. M. Wheeler, director general of archaeology in India, on the mound of Harappa revealed traces of great mud brick citadel walls, faced with a glaze of burned bricks. The proposition for a northwest Indian utopia of 2500 B.C. no longer holds. Moreover, Wheeler recalled the later Aryan legends of the god Indra as a "fortress destroyer," as probable corroboration for the suggestion that the Indus cities (and their civilization) were destroyed by the incoming Aryans about 2000 B.C. or just later.

Ancient India also includes a report on Arikamedu, an Indo-Roman trading station near Pondicherry on the southeast coast. A warehouse and several other structures of about A.D. 50 had been exposed on the site, also numerous sherds of Arretine and other Italian types of pottery. One untrimmed example of an intaglio decorated gem, in the Greco-Roman style, suggests that even western craftsmen themselves may have lived and worked at this far-off site. The presence of this Roman market on the southeast coast of India is a remarkably fine substantiation of the accounts of both classical and Tamil writers that such "factories" existed. In effect, a new chapter was added to the history of India's economic relations with the west.

No important archaeological news from the far east was available for the year. More details and photographs of the tomb of the T'ang emperor, Wang Chien, became available.

(R. J. B.)

Western Hemisphere.—In connection with the Canadian military exercise called "Operation Musk Ox," an archaeological survey was conducted by Maj. Graham Rowley. Among his discoveries was a promising site near Baker lake in the area northwest of Hudson bay.

L. J. Giddings, Jr., of the University of Alaska, collected dendrochronological specimens along the Mackenzie river and arctic coast. This material was expected to be of aid in the dating of ancient Eskimo sites.

Dr. Douglas Leechman of the National museum of Canada made an archaeological survey of the upper Yukon and Porcu-

pine rivers. He found remains of non-ceramic cultures in geological contexts that would indicate considerable antiquity.

Eastern North America.—The excavation for the new John Hancock Life Insurance building, 800 ft. from the site of the Boylston street fishweir in Boston enabled Frederick Johnson of the Peabody museum, Andover, Mass., to make additional study of the sediments associated with this ancient site. Although no actual portions of the fishweir were found, Johnson, in collaboration with a number of other scientists, obtained much additional information concerning the sediments in terms of studies of foraminifera, diatoms, pollen and other organisms.

Douglas S. Byers of the Peabody museum conducted a limited reconnaissance and sampling of shell heaps in Hancock county, Me.

During the summer the Rochester museum expedition, under the direction of Dr. William A. Ritchie, excavated an early period Owasco site in Onondaga county, N.Y. This site was a deposit of quantities of large pottery fragments of the Canandaigua type, numerous fragments of animal bone, mostly black bear, two pitted hammerstones, a fired clay pipe and a clay phallus. Probably this find is indicative of a prehistoric ceremony analogous to the historic feast of the dead.

In November, Joseph Caldwell began an archaeological survey of the Allatoona basin above Cartersville, Ga.

During Nov. and Dec. John W. Griffin began a program of exploration and excavation for the Florida park service in the little-known area of southwestern Florida.

Under the direction of Glenn A. Black a party of students from Indiana university carried out excavations at the famous Angel site near Evansville, Ind. This site was a large village and ceremonial centre of the middle Mississippi Indians c. A.D. 1400-1650.

Dr. Emerson F. Greenman of the Museum of Anthropology of the University of Michigan completed his ninth field season at Killarney, Ont. Excavations were continued in an early post-glacial site, dated at 10,000 to 15,000 years old by its association with an ancient raised beach. Quantities of artifacts made of flaked quartzite have been found. A basilar portion of a Yuma-like blade suggests the possibility of relationships with the west.

Under the direction of Richard G. Morgan of the Ohio State Archaeological and Historical society, surveys were made of the Delaware and Dillon reservoir areas in Ohio. Plans were formulated to salvage as much archaeological material as possible before these proposed reservoir areas were flooded by dam construction.

In Aug. an Adena mound in Fayette county, Ky., was excavated under the direction of Dr. William S. Webb and William G. Haag of the department of anthropology and archaeology of the University of Kentucky. This mound, unit C of the Mount Horeb Earthworks group, covered one of the richest caches of flint and copper artifacts ever found in Kentucky.

The tremendous archaeological program in connection with the proposed flooding of reservoir areas by the Missouri Valley authority was begun during the summer. A number of state institutions co-operated with federal agencies in the archaeological survey of the areas to be flooded. Surveys of these areas and excavation of key sites must be undertaken while the areas are still accessible. The Missouri Basin survey program was carried out under the direction of Dr. Waldo R. Wedel of the U.S. National museum. Although the program was far from completion, about 550,000 sq.mi. were surveyed archaeologically and hundreds of sites were recorded. About 200 sites were selected for excavation.

Western North America.—The department of anthropology

of the University of Washington conducted an archaeological survey of the San Juan Islands during the summer. The survey was undertaken as a field course by students under the direction of Arden R. King. This survey marked the beginning of a long-term archaeological investigation of the North Pacific coast—a region almost completely unknown.

A month's program of excavation and survey in the John Day region of north central Oregon was undertaken by Dr. L. S. Cressman of the Oregon State Museum of Anthropology. Efforts were made to determine the possible connections of the cave culture of the south central part of the state with the Columbia river region in the north.

Under the leadership of Dr. Paul S. Martin the Chicago Natural History museum's 1946 archaeological expedition to the southwest was in the field from June to Sept. The expedition completed the excavation of the "SU" site (interrupted by the war) in New Mexico about 100 mi. north of Silver City.

The "SU" site, tentatively dated at A.D. 500, is a manifestation of the Mogollon culture. Prewar expeditions of the museum established the styles of house types, pottery, tools, weapons, utensils and ornaments as they occurred at this site. The aim of the 1946 expedition was to recover charcoal specimens from burned roof beams and supports in the old Mogollon pit-houses. About 150 charcoal specimens were found and were to be used for obtaining the exact date of the "SU" site by means of dendrochronology. In addition to the charred logs, 1500 potsherds and 500 stone and bone tools were excavated from the pit house ruins.

In August the department of anthropology of the University of Arizona and the Arizona State museum concluded their first season's field work at Point of Pines, 75 mi. east of San Carlos on the San Carlos Indian reservation. The expedition consisted of ten students under the direction of E. B. Sayles, curator of the Arizona State museum and Dr. Emil W. Haury, head of the department of anthropology at the University of Arizona and director of the Arizona State museum.

The season's work inaugurated a 10 to 15-year research program and the establishment of an archaeological field school.

Archaeological work consisted of the clearing of debris from 14 rooms of a small 14th century pueblo. The rooms were full of household goods and since there was no evidence of fire, it looked as if the pueblo had been abandoned hastily. A possible cause of such hasty and enforced evacuation might have been the arrival of Apache Indians from the east.

Tests indicated that there were pit houses beneath the floors of the rooms in the pueblo. Associated pottery fragments indicated that these pit houses were occupied by 12th century Pueblo people, an exceptional situation because the Pueblo people to the north lived in large communal and many-storied houses.

The Point of Pines area promised to be important to archaeological research in the southwest. A previous survey by Haury and Sayles showed that this region contained numerous ruins, large and small, occupied from the early centuries of the era to about A.D. 1400. The major southwestern cultures, Anasazi (Basket Maker-Pueblo), Mogollon and Hohokam are represented in the occupancy of the ruins in the Point of Pines area.

A significant contribution to southwestern prehistory was the publication of "Archaeology of Alkali Ridge, Southeastern Utah" by J. O. Brew (*Papers of the Peabody Museum of American Archaeology and Ethnology*, Harvard university, vol. xxi).

Mexico.—The Instituto Nacional de Antropologia continued its numerous and varied excavations. Under the direction of Dr. Alfonso Caso investigations were continued at Monte Alban in Oaxaca.

COLOSSAL BASALT HEAD from the site of San Lorenzo on the Rio Chiquito, in southern Veracruz, Mexico, being photographed by a member of the 1946 National Geographic Society-Smithsonian Institution Archaeological expedition. It was one of five such heads found there

Excavation of an Aztec temple ruin near the Plaza de Santiago produced among other things an excellent series of Aztec ceramic periods including the earliest fabric-impressed pottery found in Mexico. This investigation was undertaken by Dr. Pablo Martinez del Rio. Dr. James B. Griffin of the Museum of Anthropology of the University of Michigan collaborated with Dr. del Rio in the ceramic studies.

During the winter and spring Dr. Wilfredo du Solier undertook exploration of the Tamuin site near Valles, San Luis Potosi. This was a Huasteca ruin of the fifth and sixth periods and consisted of a temple and pyramid. The outstanding features of this site were the murals on the walls of the temple. The depictions in these murals provide the first good archaeological evidence of Huastecan ceremonial activities.

At Buena Vista a Huasteca site excavated by Du Solier produced polished black pottery with engraved designs. This pottery was somewhat similar to certain Caddo types (Fulton Aspect) found in the southeastern United States.

Dr. James B. Griffin of the Museum of Anthropology of the University of Michigan was in Mexico from Feb. to Sept. searching for evidence of prehistoric relationships between Middle America and the southeastern United States.

From Nov. 1945 to June 1946 Richard MacNeish of the department of anthropology of the University of Chicago conducted an archaeological survey of the coast of Tamaulipas, Mexico, between the Sola Marina river and the Texas border.

Archaeological discoveries in this region included late Huasteca (periods five and six) and six new cultures previously unknown. Five of these newly discovered cultures were non-ceramic, probably the products of groups of nomadic Indians

who lived by hunting and food collecting. The sixth culture, named Pueblito, was more elaborate.

The Pueblito culture found in the Sierra de Tamaulipas area was characterized by pyramids of stone, round house platforms of stone, village sites located in defendable areas and unpainted pottery of poor paste with engraved designs.

Typology and stratigraphy of the pottery indicate three ceramic periods of Pueblito culture. These periods seem to correlate with middle and late Teotihuacan and perhaps with Huasteca periods three, four and five.

Huasteca camp sites of the period c. A.D. 1100-1500 were found within 30 mi. of the Texas border, thus considerably extending the northward range of the Huasteca culture.

MacNeish found some evidence of relationship between Huasteca and cultures of central Texas and the Caddo culture of eastern Texas. There were 40 specific resemblances between the Caddo and Huasteca cultures, evidence, perhaps, of small groups of Huasteca traders or similar people who wandered up the Tamaulipas coast to the Rio Grande, then up the Rio Grande and across central Texas to the eastern region of Caddo culture. If MacNeish's data are clearly demonstrable, they will offer the first concrete and specific evidence of cultural relationships between Mexico and the southeastern United States.

With a grant from the Viking Fund, Inc., of New York, Dr. Helmut de Terra undertook a study of the Late Quaternary period in Mexico in search of evidence of early man. Two ancient cultures were discovered. One culture, characterized by scrapers, flakes, chipped pebbles of obsidian and chalcedony and a pointed bone tool was represented at three localities in alluvial and beach formations containing remains of mammoth, bison, horse and other land animals of the Upper Pleistocene. This culture is believed to date back to about 15,000 B.C.

Another old culture, represented by choppers, cores, high-keeled and flat discoidal scrapers, end scrapers and hammerstones, all made of basalt, was manifested in ancient valley fills and fossil caliche soil of early postglacial age, 5,000 to 10,000 B.C.

Guatemala.—Dr. Helmut de Terra extended his search for early man from Mexico to Guatemala, but failed to find evidence of ancient remains in Guatemala. He reported a fossil land mammal fauna in the Motagua valley, probably synchronous with the fauna associated with the earliest finds in Mexico.

In March the United Fruit company began a five-year project of archaeological research in the Guatemala highlands. Under the direction of John M. Dimick, assisted by Stanley H. Boggs, work was begun at Zacaleu near Huehuetenango and about 175 mi. northwest of Guatemala City. One small tomb was discovered and much of the site was reconstructed.

Ledyard Smith of the Carnegie institution excavated a tomb associated with some mounds near Nebaj, department of Quiché. The tomb, nearly ten metres beneath the surface of a low platform, contained jades and fine pottery.

Peru.—The Virú valley program of the Institute of Andean Research lasted from April to Dec. Eight individuals representing five institutions participated in this co-operative study.

Eight periods of culture were tentatively formulated: (1) Cerro Prieto (coastal preceramic); (2) Guañape (Cupisnique); (3) Puerto Moorin (Salinar); (4) Gallinazo (Virú Negative); (5) Huancaco (Mochica); (6) Tomaval (North Coast Tiahuanaco); (7) La Plata (Chimu); and (8) Estero (Inca influence).

Junius Bird of the American Museum of Natural History investigated the preceramic remains of coastal Peru. The preceramic culture was based in part on an agricultural economy—gourd, squash, lacuma and cotton were present in the remains

along with bark-cloth, twined textiles and percussion-flaked tools of stone.

The Chicago Natural History museum expedition under the leadership of Donald Collier obtained stratigraphic evidence showing the cultural evolution from the Guañape (Cupisnique) period to the Puerto Moorin (Salinar) period. Previously there had been a cultural gap between these two periods.

James A. Ford of the American Museum of Natural History made an analysis of the pottery types from surface collections and excavations. He was able by such analyses to place chronologically a number of unexcavated sites in terms of the range of occupancy indicated by the pottery types.

Dr. Gordon R. Willey of the Bureau of American Ethnology made a study of the settlement patterns in the Virú valley as revealed by archaeology. In periods one and two there were small, isolated populations living by marginal horticulture. Periods three and four are marked by increases in population, irrigation and developed horticulture, and the first appearance of large politico-religious centres. Period five presents evidence of political conquest. Period six was a time of disruption. Periods seven and eight show a trend toward urbanization and the building of planned communities.

Dr. Wendell C. Bennett of Yale university conducted intensive excavations in the Gallinazo group belonging to the Gallinazo period. Sites of this group contained pyramid and mound platform combinations, platform dwelling mounds, refuse mounds and simple mounds with refuse and burial. A number of building levels were determined.

Dr. W. Duncan Strong of Columbia university assisted by Clifford Evans of Columbia university conducted stratigraphic work in refuse deposits and graves. Two excavations gave detailed data on the transition from Puerto Moorin (Salinar) to Gallinazo (Virú Negative). A third site placed Huancaco (Mochica) over Gallinazo (Virú Negative), and a fourth site isolated the Puerto Moorin (Salinar) burial complex.

Archery. The 62nd championship tournament of the National Archery association, the first after 1941, was held at Cincinnati, O., Aug. 5-9, 1946, with the record number of 316 archers participating.

The championship winners were:

Senior Division			
Women's Championship	Scores:	Double National Round	Ann Weber, Bloomfield, N.J. 142-1026
		Double Columbia Round	143-1159
Men's Championship	Scores:	Double York Round	G. Wayne Thompson, Richmond, Calif. 271-1585
		Double American Round	180-1390
Junior Division			
Boy Champion	Scores:	Single Junior American	Jay Reeg, St. Louis, Mo. 90-678
		Double Junior American	180-1334
Girl Champion	Scores:	Single Columbia Round	Alice Ann Bredehoft, Millington, N.J. 71-459
		Double Columbia Round	143-909
Flight Shooting			
Women			
Regular Style	Millie Hill, Dayton, O.	434 yd. 10 in.	
	Mrs. Cecil Modlin, Evansville, Ind.	564 yd. 6 in.	
Men			
Regular Style	Herbert Henderson, Evansville, Ind.	521 yd. 11 in.	
	Charles Pierson, Cincinnati, O.	658 yd. 2 ft. 8 in.	
Junior Division			
Boys			
	Richard Knorr, Cincinnati, O.	378 yd. 6 in.	
Girls			
	Peggy Dunaway, Springboro, O.	427 yd. 2 ft. 9½ in.	

An important archery event in 1946 was the first championship tournament of The National Field Archery association to determine the field archery championships of the United States. This was held at Allegan, Mich., Aug. 9-12, with 476 field archers competing for the national titles.

The championship winners were: Erwin C. Pletcher, Bakersfield, Calif. (men); Mrs. H. A. Bitzenburger, Los Angeles, Calif. (women); M. LeFavour, Fort Wayne, Ind. (junior boy); Kathleen Powell, Portland, Ore. (junior girl).

During 1946 the National Archery association conducted several nation-wide contests by mail, as was done during World War II. These included the Olympic Bowmen league for indoor shooting, the Women's Intercollegiate contest, the Inter-scholastic contest, a clout shoot, a target shoot and a flight shoot.

(L. C. S.)

Architecture. During the year 1946 there developed the full realization of the colossal task of rebuilding the devastated areas of the world and of making up the lag in construction in the countries which had concentrated on production for World War II. The warnings of professional bodies concerning the magnitude and complexity of the task changed from abstract theories to acute needs felt in lack of shelter, overcrowding, mounting building costs and rents.

In most countries active governmental intervention in the building industry became necessary and housing and town planning were political issues. The demand for all types of building was so great and material and labour so inadequate that various systems of priorities, allotments and price controls were maintained throughout 1946.

Great interest in the problems of architecture was a natural result and ranged from exhibits of prefabricated houses by the various occupying armies in Germany to an unprecedented number of books on home design and ownership in the United States. In most cases the enthusiasm for the promises of what was to be had been lost in the acute realization that the world-wide building crisis would last for many years.

While a record volume of building construction got underway, few large projects were completed during 1946. The increasing complexity of modern buildings made them susceptible to delays because of the lack of small but essential items often slow in returning to the market. As a result, any evaluation of trend and progress has to be based in the main on published plans, presentation drawings and models.

It was clearly observed that modern design, seeking a straightforward solution to contemporary problems by exploiting today's materials and methods, outweighed the traditional and electric expression favoured in the first part of the 20th century. Modern solutions to commercial and industrial are universal and it is in domestic and governmental work that traditional design is most persistent. National variations of style were apparent and the concept that there should be an "international" style, a style for all regions, was disproved and disavowed by many once holding this idea.

The influence of science and technology on architecture was increasing, though in actual building this change was not readily apparent as the "tooling-up" period and co-ordination of parts required time for careful planning, testing and widespread use. The application of new wartime developments in materials and methods was promised with increasing assurance but was not fulfilled to any appreciable extent.

An increased awareness of the necessity for, and economy to be found in large-scale building projects was noticeable, not only in the countries to be rebuilt but in the United States. The problems of city planning received greater attention from both architects and laymen alike. While housing construction re-

ceived the greatest attention, a great deal of building for commercial distribution and factories was undertaken along with building for public services and veteran rehabilitation.

Design and Planning.—The modern approach to planning and design became more firmly established. With architects' offices everywhere deluged with commissions, preoccupation with problems of increased building cost forced an increase in the use of simple, direct solutions. The acceptance of modern design was shown by polls of consumer preferences in the United States which indicated a majority interested in modern or "ranch type" homes. The latter is a style characterized by large windows, pitched roofs, often utilizing natural materials and long and low in appearance because of being one floor. In competitions, juries found in favour of modern design. In the U.S.S.R., published designs varied from this general trend and were characterized by a neo-classic trend or an insistent national feeling created by the regional handling of local materials.

In general, the absence of applied ornament was being compensated for by a careful interplay of the textures of building materials. The critics who condemned an architecture without decoration were joined by the Dutch architect Jacobus Oud, once famous for a severe style, who completed a building notable for areas of extremely bold decoration. This independent exception contrasted with a general interest in developing the expression of each building from its own peculiar function, site and materials and methods employed.

In residential design trends apparent before the war continued. Rooms became smaller because of rising costs, but were often made to serve double functions and the art of the designer was used to give a greater sense of space. This was done by means of large glass areas and free planning which allowed one room to merge with another in a manner adding space to both. The decreasing size and number of rooms in dwelling units reflected the decreasing number of children in families, fewer servants and a greater number of women in business and professions. In the United States a Veterans' Emergency Housing program set out to construct single family houses costing under \$10,000. The failure of this program late in the year was followed by emphasis on more desired rental housing. More and more interest in row and group housing appeared in the United States in spite of government aid in financing, and other stimulation of single home ownership. A number of co-operative housing projects were completed or started during the year, in which groups sought the economies to be found in larger-scale building operations.

The lessons of wartime production led to the initiation of many new industrial projects in which flexible techniques of manufacture and new machines accompanied an increased study of the workers' needs based on scientific measurement of light, colour comfort and psychological atmosphere.

The danger of atomic warfare seemed to have had little effect on building plans generally, although reports from Sweden indicated advances in subterranean factories. It was claimed the excess initial cost of such plants was offset by decreased maintenance to a marked degree. The totality of future war was so well understood that more hope was being placed in international action to prevent war than planning and design as a defense against its terrors.

Shop buildings in many countries showed the merchants' eager efforts to return to peacetime competition with an increased emphasis on architectural design as an aid to merchandising. New shops smartly emerged from the rubble in the form of temporary buildings which in simplicity and scale showed an ever-closer relation between purchaser and the displayed merchandise. In the United States the all-glass "open front" design of stores spread to other commercial enterprises. The Trans-

continental and Western Air ticket office in Chicago, Ill., illustrated an outstanding example of this type of design, where outside and inside were blended by extending the plane of walls or ceiling beyond the transparent front wall and utilizing artificial light to further break the barrier between customer and interior.

Many new office buildings were projected or were under construction. New standards of summer air conditioning and utmost flexibility in possible partitioning of space made increasing demands on the designer. Continuous windows based on modular design, flush ceilings of interchangeable panels and lighting units, increased use of aluminum and parking space in each building block were featured. Though students predicted the end of the era of high buildings for New York city, a score of relatively high buildings were started or only awaited freedom from government restrictions on materials and permits.

The great number of medical facilities planned or started in 1946 reflected the need for care of those wounded in the war as well as higher standards in the care of the sick. Health insurance, by the state or by voluntary associations, lies behind some of the expansion. Many of the great hospital projects were in connection with university medical schools or medical research foundations. Highly specialized functions and elaborate circulation and service problems were skillfully met. The special psychiatric hospital made its debut in recognition of the importance of this growing field of therapy.

Materials and Methods.—Throughout the world great interest and faith was placed in the promise of prefabrication. By the end of the year enthusiasm was replaced by an equally unrealistic sense of failure. Experts who proposed metal houses for devastated Europe without realizing the time necessary for the reconversion of productive facilities and manufacturers wishing to be subsidized for entering a new field of production without experience all promised more than it was possible to deliver. The failure of 1946 to produce the hundreds of thousands of dwelling units expected was not one of technology, but of time.

While increased efficiency of the mechanical plant of the home, especially heating, was to be expected, most buildings were erected with prewar types of equipment. The first commercially available mechanical core for the home, containing heater, bath, kitchen and laundry in one unit, went into production. As a demonstration of its flexibility a group of houses designed by outstanding North American architects was built in Kalamazoo, Mich. One example was called a solar house because of a correctly oriented glass area which takes the fullest advantage of the sun's rays, an overhang eliminating undesirable summer sun, yet allowing the lower-angled winter sun to do its work. This particular house used the hot air of the heating unit in under-floor ducts to afford radiant heating, a principle which gained wide acceptance.

The use of plastic and other composite materials increased but no new material threatened the widespread utilization of various forms of masonry, wood, steel and glass.

The expanding scale of builder operations was significant. Contractors once averaging 5 to 10 houses a year were undertaking developments of 100 and more houses at a time. Using site assembly methods, power tools and often monotonously repeated designs, the housing shortage was being met for the time being more effectively by moving machines to the site than by factory fabrication.

The complexity of the construction industry and the interdependence of various materials and equipment which must somehow be fitted together in a building, resulted in greater interest in standard dimensioning of architectural components. In the United States a 4-in. module was gaining slow recognition.

In the Soviet Union the same problem was recognized by the Soviet Academy of Architecture which had proposed to the various government bureaus a module of 10 cm.

A series of disastrous hotel fires in the United States focused attention on the rewriting of many municipal building codes. These were being studied to take advantage of new materials and methods now forbidden by archaic laws as well as to increase safety to life and property. They promised greater opportunity to the designer.

Education.—In every country the crisis in building was completed by a lack of trained architects, technicians and building labour. The schools of architecture were overcrowded. The overwhelming majority of schools presented a modern approach to design problems which could only result in an ever-increasing trend toward modern design forms. Many individuals were concerned with over-specialization of design and proposed that architecture, at least in its training, recognize as its scope not only building design but also the design of building components and city and group planning. In the United States, the growing profession of industrial design accepted design responsibility covering architecture so that clear-cut professional areas of action had not emerged. The increasing industrialization of the building industry was inevitably making changes in the make-up of design groups in spite of laws meant to safeguard the profession.

Examples of 1946 Architecture.—In the United States the collapse of government controls and a homebuilding program aimed at securing new homes for sale to veterans occurred at the end of the year. The acute problem was given to private enterprise, the main government effort being in the form of cheaper financing which aimed at spurring rental construction. A comprehensive national policy on housing including consolidation of government functions, research in the building industry, encouragement of public and private low-rent housing, both urban and rural, and urban redevelopment failed enactment during the year by congress but was scheduled for reconsideration in early 1947. Indignation by veterans' groups and the citizens generally made the failure of the building profession under private initiative alone a political issue.

Erection was started on a number of large rental projects financed by insurance companies. A vast commercial development including markets, theatres, shops and parking and served by moving stairways was announced for Brooklyn. A city of 30,000 people, *Cidade dos Motores*, was begun in Brazil following the designs of Paul L. Wiener and Jose L. Sert. In contrast to the disciplined organization of this plan a more romantic development of similar size was announced as a satellite town for Chicago which would also contain shopping and recreational centres, public services and provision for industry.

The completion of test models of Buckminster Fuller's Dymaxion House—probably the first truly industrially conceived machine for living—captured the imagination of all who saw it. Its unusual form is the result of rethinking the problem of shelter within the limits and possibilities of machine production. This house differs from other prefabrication proposals in that the others adapt the machine to the production of forms originally developed for traditional handicraft methods.

The completion of the Copenhagen Broadcasting building by Vilhelm Lauritzen marked a trend in straightforward, uninhibited design and planning. The peculiar charm of Swiss and Scandinavian architecture accurately reflected the democratic, mature culture of these countries. In Sweden an outstanding apartment group consisting of seven tower buildings by Sven Backstrom and Leif Reinius was dramatic, intelligent and livable.

One of the very few, and certainly the most unusual, religious projects completed during the year was the chapel of St. Francis

Above: RENDERING OF an office building which was under construction in New York city during 1946. Kahn and Jacobs, architects

Left: PROGRESSIVE COMMERCIAL DESIGN applied to the TWA, Trans World airline, new offices in Chicago, 1946. Transparent street walls and extension of the ceiling were basic to the "open front" trend

Above: SOLAR HOUSE erected at Kalamazoo, Mich., in 1946, one of 12 demonstration homes designed around the Ingersoll Utility unit. In this unit the water, gas, sewer, electrical, heating and ventilating systems of the house are built into a prefabricated central core. Architect of this house, George Fred Keck

Pampullia, in Brazil, by Oscar Niemeyer. This concrete arched building, decorated with tiles, entered under a cantilevered marquee and dominated by a tower narrower at the bottom than the top, is excitingly located on a hill overlooking a lake. It was certain to provoke interest and controversy concerning ecclesiastical forms.

At the year's end a committee of the United Nations accepted a gift of land extending six blocks along the New York water front from John D. Rockefeller as a site for the permanent home of this international organization. A committee including the famous French architect Le Corbusier (Charles Édouard Jeanneret) covered the Atlantic seaboard in search of a suitable site. At the end of the year Wallace K. Harrison of New York was appointed head of design for the buildings of the United Nations in New York.

Once again the septuagenarian, Frank Lloyd Wright, provoked interest and ire by a house to be built in Connecticut. His work was widely published during the year, especially his home and school, Taliesin II, in Arizona. During a year of frustrated building, the prophecies and designs of this great architect took on greater meaning. (See also BUILDING AND CONSTRUCTION INDUSTRY.)

Archives, National. Established by congress in 1934, the National Archives preserves the valuable noncurrent records of the United States government and makes them available to the government and the people.

There were more than 750,000 cu.ft. of such records in the custody of the archivist by the close of 1946. Ranging in date from the Revolutionary War to 1946, they came from almost every federal agency. Notable among records received in 1946 are the files of the house of representatives, 1789-1940; records relating to the establishment of post offices and the appointment of postmasters, 1790-1930; naval records, 1911-27, collected by the office of naval records and library; and the files of such World War II agencies as the Office of Censorship, the War Relocation authority, the War Refugee board and the office of the chief counsel for the United States (Justice Robert H. Jackson), international military tribunal. A number of Japanese surrender documents and Adolf Hitler's marriage certificate, private will and last political testament, signed the day before he is believed to have died, are documents of particular interest among the records received.

To facilitate the use of records in the archivist's custody, a brief guide to them, *Your Government's Records in the National Archives*, was published and a comprehensive guide was almost completed during the year. A project to describe the recorded experience of the government in World War II, as it is embodied in materials in the National Archives and elsewhere, was also undertaken.

Current government regulations that have general applicability and legal effect and descriptions of the organization and procedures of federal agencies are published by the National Archives in the *Federal Register*. The archivist of the United States is also responsible for the Franklin D. Roosevelt library at Hyde Park, N.Y., which houses the papers of the former president. During 1946 some of these papers were opened for research. (S. J. Bu.)

Areas and Populations of the Countries

of the World. The table that follows gives the area, population and population per square mile for

the various countries of the world. For many countries it was difficult under conditions of 1946 to secure population data which were entirely satisfactory.

The latest available figures relate to different dates in different countries; and in some cases different dates connote different areas.

The table gives figures for practically the entire world, however, with a minimum of overlap or similar complication and with a sufficient degree of accuracy to serve as a source of general information with respect to the relative importance of the several countries.

Areas and Populations of the Countries of the World

Name of Continent and State	Area (in sq.mi.)	Population (in thou- sands)	Popula- tion per sq.mi.
World total	52,177,643	2,231,716	42.7
AFRICA	11,524,825	163,163	14.1
Belgian colony and mandate	925,094	13,767	14.8

*Average for settled area only.

†1945 figures used in computing totals.

Argentina. A federal republic in southeastern South America, the second largest on the continent. Area (excluding the Falkland Islands, which Argentina claims), 1,079,965 sq.mi.; pop. (Dec. 31, 1944 est.), 14,130,871. The population is estimated to be 97% of European (mostly Spanish and Italian) descent; the total of foreign-born population in 1940 was 2,355,900. Urban population is approximately 75%. Population density at the beginning of 1944 was 12.96 per sq.mi. The capital and chief port is Buenos Aires (pop., 1945 est.,

2,608,333). Other important cities (with latest official pop. ests.) are Rosario (521,210), Avellaneda (399,021), Córdoba (339,375), La Plata (256,378), Tucumán (169,566), Santa Fé (149,926), Bahía Blanca (121,055), Mendoza (100,429) and Lomas de Zamora (100,000). Under the constitution of 1853 (the oldest in any Latin American state) Argentina includes 14 provinces and 9 territories. The government is headed by a president chosen by an electoral college for a six-year term, and a bicameral congress composed of a senate of 30 and a chamber of deputies of 158 members. Presidents in 1946: Gen. Edelmiro Farrell, until June 4; Juan Domingo Perón, following that date.

History.—The year 1946 opened with Argentina's most dramatic presidential campaign in full progress. Elections had been set for Feb. 24, 1946. The Democratic union, a coalition built around the Radical party and including other opposition groups, gave its presidential and vice-presidential nominations on Dec. 30, 1945, to Sen. José P. Tamborini and Enrique P. Mosca. Juan D. Perón was made the nominee of the Labour party (a group of his own creation) and a dissident wing of the Radical party. Choice of a running-mate finally went to Dr. Hortensio J. Quijano, a dissident Radical. The campaigning from the beginning of January to the election on Feb. 24 proceeded at a furious pace, the opposition charging that the government was throwing all possible hindrances in Tamborini's way. Perón on Jan. 30 made the sensational charge that the U.S. embassy was involved in smuggling arms into Argentina, but the foreign office later repudiated the charge; on Feb. 9, however, Perón made a gesture toward closer relations with the United States. The U.S. state department on Feb. 12 published a startlingly frank memorandum on the Argentine situation in which it charged Argentine-nazi political and social collaboration, negotiations for nazi military assistance to Argentina, efforts by the latter government to subvert the governments of neighbouring countries, and the existence of a strongly fascistic regime in Argentina. The so-called Blue Book was a diplomatic sensation and resulted in strong attacks

JUAN DE PERÓN (left centre) at the ceremony during which he received the presidential sash of office from the outgoing president of Argentina, Edelmiro J. Farrell, at Buenos Aires on June 4, 1946

FOLLOWERS OF PERÓN CELEBRATE HIS VICTORY in the Argentine presidential election in the spring of 1946

by Perón on Spruille Braden, the anti-Perónist U.S. ambassador to Argentina in 1945 and by 1946 the assistant secretary of state, as well as formal repudiation of the charges by the Argentine government. The Blue Book entirely failed to accomplish the hoped-for Argentine reaction against Perón's candidacy. The election was peacefully held on the date scheduled, the votes were apparently freely cast and honestly counted, and Perón won an overwhelming victory. The final electoral vote was announced as 304 for Perón to 72 for Tamborini; the popular vote was relatively closer, 1,474,447 to 1,207,359. The newly elected congress included 26 pro-Perón senators to 4 opposed and 109 favourable deputies against 49. The Democratic union was formally dissolved April 16. On May 23 Perón announced the organization of the National Revolutionary party as a merger of all groups that had supported him.

The U.S. state department on March 21 notified all other American foreign offices except that of Argentina that it would not sign a permanent hemispheric peace and security pact, proposed at Mexico City in 1945, if the Perón government were a signatory; in effect, however, this position was reversed in April. At about the same time, George S. Messersmith, U.S. envoy in Mexico and a pro-Argentine advocate at the San Francisco conference in April 1945, was appointed U.S. ambassador to Argentina. Gestures toward a rapprochement, both by Argentina and the United States, were guarded but positive later in the year. Perón's forces were in full control of the chamber of deputies when it met April 29 for the first time after 1943. The government again lifted the state of siege on May 24. Various nationalistic steps were taken in the early months of 1946: the central bank of the republic was nationalized by decree on March 25; absentee land-owning was heavily penalized by a new tax law in May; stock exchanges and export and insurance businesses were placed under national control on May 30; the Perón-controlled newspaper *El Laborista* predicted that various foreign-owned oil concessions would be expropriated. The Perón-Quirano inauguration took place June 4, the third anniversary of the revolution which brought the army group to power. Pres. Perón declared on Aug. 1 that in case of another world war Argentina would fight alongside the United States.

One of the early actions of the new regime was establishment of relations with the U.S.S.R., despite earlier bitter recriminations between the two governments; a soviet ambassador arrived in Buenos Aires Aug. 31. The United States demanded at various times during the year that Argentina take steps to implement its commitments against nazi Germany but as late as Oct. 30 Ludwig Freude, a prominent German in Argentina, was absolved of charges of nazi activity. Government efforts to reduce the cost of living, begun just after Perón's inauguration, allegedly slowed almost to a halt by mid-August. When the senate and the chamber of deputies, on Aug. 19 and Aug. 30, respectively, approved the Chapultepec and San Francisco agreements of 1945 by large majorities, at Perón's behest, nationalistic demonstrations were set off. The government in September took steps to bring about the impeachment and removal of four of the five members of the supreme court, which had frequently invalidated Perónist measures. Perón in November presented a comprehensive five-year plan for Argentina to the congress. It included 27 basic laws, ranging from complete reorganization of government departments to general reform of the customs laws; proposed legislation on most aspects of agricultural and industrial economy was included. The government also projected a 50-year immigration plan to raise Argentina's population to 100,000,000. The chamber of deputies on Nov. 29 passed a bill providing universal conscription for all men and women from 12 to 50 years.

Education.—School enrolment in 1946 was almost 2,000,000. The literacy rate was estimated at 85%. The government on May 2 seized all six national universities for alleged interference in politics and named interventors for them.

Finance.—The monetary unit is the peso, valued on Nov. 15, 1946, at from 20.24 to 26.81 cents, U.S. currency, depending on the type of exchange. The ordinary budget for 1946 (decreed Jan. 5) estimated revenues at 1,390,000,000 pesos and expenditures at 1,769,000,000 pesos, leaving a deficit of 379,000,000 pesos. The preliminary figures did not include any proposed bond issues. The 1945 budget (not finally decreed until Dec. 17, 1945) indicated total expenditures of 2,849,000,000 pesos, of which 1,155,000,000 pesos came from bond issues and 1,694,000,000 pesos from ordinary revenues; the revenues were estimated at 1,355,000,000 pesos, leaving a deficit for that year of 339,000,000 pesos. Military expenses represented 46% of all 1945 expenditures, public works 12.5%, justice and public instruction 10.5%, other ministries 16.5% and debt service 11.5%. The consolidated debt Jan. 1, 1946 (not including the floating debt) was 12,300,000,000 pesos, an increase of 700,000,000 pesos in one year. Bank deposits on Jan. 1, 1946, were 8,140,000,000 pesos and discounts and loans 3,419,000,000 pesos; postal savings Oct. 31, 1945, totalled 328,000,000 pesos. National revenues in the first quarter of 1946 were 427,000,000 pesos (same period in 1945: 367,000,000 pesos). Commercial banks on Feb. 28 had 7,776,000,000 pesos in loans, advances and investments and 798,000,000 pesos in capital and reserves. The government's nationalization of the central bank on March 25 was followed by a decree April 24 putting all bank deposits under control of the central bank, with the government undertaking to guarantee all deposits. A decree of May 8 gave the central bank control over all foreign exchange operations. The United States agreed on June 25 to release \$700,000,000 of Argentine gold frozen by the federal reserve bank during wartime. The Argentine government in July announced plans to redeem foreign debt amounting to \$135,400,000 and 56,000,000 Swiss francs. A 1,000,000,000-peso bond issue, intended partially for debt retirement, was authorized Nov. 19. Three tax-increase bills were passed just before Perón's inauguration: on personal incomes, on undistributed profits of corporations and on divi-

dends and interest remitted abroad; the government also adopted a capital gains tax. The official cost-of-living index at the beginning of 1946 was 137 as against 100 for 1939; the wholesale price index in March was 228.7 as against 100 in 1926. The cost of living was estimated to have risen 11% for workers and 23% for middle- and upper-income groups in 1945. Inflation continued early in 1946. Argentina on April 26 granted Spain a \$7,500,000 loan for food purchases. Two British financial missions went to Buenos Aires early in the year to explore the whole field of mutual financial relations; they proposed to discuss the liquidation of blocked sterling amounting to about £150,000,000, a new trade agreement, railroad negotiations and other matters. The British put a value of £250,000,000 on their railway investment in Argentina, although others estimated it at £90,000,000. The financing of the proposed five-year plan would require approximately 6,662,000,000 pesos exclusive of national defense expenditures; some of the items included were: organization costs, 72,700,000 pesos; power projects, 2,000,000,000 pesos; public works and transportation, 3,500,000,000 pesos. Each law involved called for funds from special appropriations to be supplemented by new bond issues.

Trade and Communication.—The wartime foreign trade pattern of emphasis on exports of meats, hides, leather goods and mineral products tended in 1946 to shift to a more normal emphasis on grain exports. Total exports in 1945 were 7,046,000 short tons valued at 2,485,200,000 pesos (1944: 2,360,400,000 pesos); imports were valued in 1945 at 1,154,000,000 pesos (1944: 1,007,154,000 pesos); the 1945 export balance was thus 1,331,200,000 pesos (1944: 1,353,200,000 pesos). Exports in the first quarter of 1946 were 1,731,000 short tons (same period in 1945: 1,510,000 tons) and imports 1,988,000 tons (1944: 1,012,000 tons); the favourable trade balance for the quarter was 280,000,000 pesos. The United States was the principal supplier by value in the first quarter of 1946, with 22.4%. Other fractions were: Brazil, 20.8%; Great Britain, 13.4%; Sweden, 5.7%; and Switzerland, 4.7%. Brazil was the principal supplier in 1945. Exports of various products in 1945 included: wheat, 2,357,302 metric tons; quebracho extract, 225,000 metric tons. Various imports in 1945 included: coal, 779,803 long tons (of which 423,014 tons came from South Africa); crude petroleum, 1,002,000 bbl.; fuel oil, 2,800,000 bbl.; gas oil and Diesel oil, 510,000 bbl.; chemicals, 80,483,000 pesos. Wool exports for 1944-45 (on a grease-wool basis) were 136,381 metric tons (1943-44: 121,460 tons); the 1945-46 clip was estimated at 230,000 tons. Grain exports for the first four months of 1946 were 1,226,000 metric tons (same period in 1945: 1,116,000 tons); wheat exports in the first quarter dropped to 285,000 short tons from 760,000 tons in the first quarter of 1945. The estimate of exportable corn for 1946 was about 2,200,000 metric tons. Exports of quebracho extract in the first seven months of 1946 were 176,197 metric tons (same period in 1945: 144,646 tons); cotton exports in the same period were 22,432 metric tons (same period in 1945: 4,085 tons) valued at 28,345,841 pesos (1945: 4,081,525 pesos). Great Britain and Argentina on Mar. 11 extended their trade agreement (the Roca-Runciman pact) to Aug. 21 but it then expired. A new agreement, signed in mid-September, included chiefly financial provisions but revived the lapsed trade pact until Dec. 31, pending later negotiations. Argentina negotiated trade agreements with India on Sept. 27 and with Spain on Oct. 31; Perón received a soviet trade mission on April 10 for discussions and negotiations were also anticipated with Czechoslovakia, Bolivia, Venezuela and Switzerland. The government established a foreign trade institute Aug. 27 as the sole agent for meat exports.

Railways and highways totalled, respectively, 26,384 and 254,370 mi. The Argentine merchant fleet owned 27 ships of 134,811 tons; the coastal trade carried about 500,000 tons per year. The government in 1946 considered plans for a merchant fleet of at least 100 vessels for the inter-American trade. The United States on April 11 lifted various shipping restrictions against Argentina. The government program for aviation development provided for establishment of six zones for domestic air lines, expenditure of 3,500,000 pesos on six major airport projects and other improvements. Air France was authorized to fly to Argentina and through Argentina to Chile. A decree of Jan. 2 established the Flota Aérea Mercante Argentina (F.A.M.A.) to emphasize air express and freight service. Argentina, jointly with Chile, considered plans for a new tunnel under the Andes, for both trains and automobiles, at a length of 12.5 mi. and an estimated cost of 170,000,000 pesos. Freight carried by Argentine railways in the last half of 1945 was 26,845,000 metric tons (same period in 1944: 27,238,000 tons); passengers totalled 138,985,000 (an increase of 15%). The government considered a five-year plan for expanding telephone facilities; telephones totalled more than 500,000.

Agriculture.—Estimates of various crops in the 1945-46 season included: wheat, 4,300,000 metric tons (five-year average: 6,384,000 tons); linseed, 1,401,000 tons (1944-45: 1,405,000 tons); oats, 825,000 tons (1944-45: 719,000 tons); barley, 1,012,000 tons (1944-45: 540,000 tons); rye, 340,000 tons (1944-45: 290,000 tons); corn, 4,700,000 tons; sunflower seed, 979,000 tons (1944-45: 985,000 tons); peanuts, 158,000 tons; cotton, 76,900 tons; flaxseed, 1,200,000 tons. Sugar cane ground in 1945 totalled 6,478,000 metric tons (1944: 5,445,000 tons); sugar production in 1945 was 449,147 tons (1944: 459,000 tons); the estimate of sugar production in 1946 was 530,000 tons. Cereal and linseed prospects were considered good for 1946-47. Slaughter of hogs in 1946 was estimated at 1,850,000 head (only 55% of the 1945 slaughter); the sheep population was estimated July 1, 1945, at 58,181,800; hide production in the first quarter of 1946 included: cattle, 1,428,090; calf and kidskins, 314,832.

Manufacturing and Mining.—All industry closed for a three-day lockout beginning Jan. 14 in protest against the government's bonus decree in Dec. 1945. The average worker's wage reached a six-year peak in Nov. 1945 (index of 144 as against 100 for 1940) and was expected to continue upward in 1946; it was questionable, however, whether real wages showed any gain. Argentina's 191 flour mills with a daily capacity of 9,500 metric tons did not represent the country's total milling capacity; by March 1946, an additional 54 mills with a daily capacity of 1,200 tons were inactive. Yarn and fabric production in 1945 included: cotton yarn, 64,962 metric tons; cotton fabrics, 35,000 tons; wool fabrics, 19,000 short tons; rayon yarn, 4,016,400 kg. of viscose and 178,580 kg. of acetate. Estimate of raw cotton consumption in 1946 was 78,000 metric tons (1945: 74,548 tons). Various strikes in 1946 (especially in *frigoríficos* and shoe factories) considerably reduced industrial production.

Crude oil production in 1945 was 22,880,007 bbl. (1944: 24,229,634 bbl.); of this amount Yacimientos Petrolíferos Fiscales (Y.P.F.), the government petroleum agency, produced 15,453,863 bbl. (a decrease of 751,498 bbl. from 1944) and private firms 7,426,144 bbl. (decrease of 598,129 bbl.). Petroleum reserves were estimated at 238,300,000 bbl. (See also FASCISM.)

Arizona. The "Grand Canyon state" lies in the southwestern part of the United States. It borders Mexico on the south; the Colorado river forms most of the western boundary. Area 113,909 sq.mi. including 329 sq.mi. of water. Population (1940) 499,261; estimated population (1946) 650,000. The 1940 census showed 65.2% rural population and 34.8% urban; native-born whites 78.1%; foreign-born whites (including Mexicans) 7.3%; Negroes 2.9%; other races (mostly Indians) 11.5%. The capital is Phoenix with an estimated (1946) population of 90,000; chief cities with their estimated populations: Tucson 60,000; Yuma 12,000; Mesa 11,000; Douglas 10,250; Flagstaff 8,100; Prescott 8,000; Bisbee 7,000; Globe 6,500.

History.—The state officials in 1946 were: chief justice, Rawghlie C. Stanford; governor, Sidney P. Osborn; secretary of state, Dan E. Garvey; treasurer, William T. Brooks; attorney-general, John L. Sullivan; superintendent of public instruction, E. D. Ring. All were re-elected on Nov. 5 except the treasurer and the superintendent of public instruction; to these positions Mit Simms and Nolan D. Pulliam were elected. The legislature met in two special sessions, on April 23 and Sept. 9. At the first, provision was made for housing married veterans attending the university and the two state teachers' colleges. At the second, appropriations were made to increase old-age assistance to \$50 per month, to administer the national school lunch program, and to increase state officials' salaries. Among several constitutional amendments presented at the November election, the "right to work" measure carried, although it was most bitterly contested.

Education.—The net enrolment for 1945-46 and the number of teachers in the public schools stood respectively as follows: elementary schools 98,562 and 2,803; high schools 24,330 and 970. In addition there were 50 private and parochial schools.

Social Insurance and Assistance, Public Welfare and Related Programs.—In May 1946, there were 26,022 persons receiving assistance from the state department of social security and welfare. The total appropriation to the department (1946) was \$5,267,475. Other appropriations for 1946 were for: industrial school \$128,000; juvenile girl offenders \$95,000; prison \$220,000; state hospital for insane \$746,969. In June 1946, Arizona ranked 11th among the states with an average of \$38.78 a month for old-age assistance. By October this had been increased to \$49.49, because of the action of the September special session.

Communication.—State and federal aid highways in 1946 totalled 3,825 mi.; county rural roads 15,543 mi.; national forest roads 3,377 mi.; and railroads 2,617 mi. There were four air bases for interstate travel. Telephones numbered 98,000.

Banking and Finance.—National banks in Sept. 1946, had deposits of \$278,592,200; loans and discounts \$73,021,911; U.S. government securities \$152,655,710. State banks had deposits of \$101,047,746; loans and discounts \$18,974,847; U.S. government securities \$63,066,001.

Agriculture.—For the first time in several years the cotton crop was harvested by volunteer labour, German and Italian war prisoners and Mexican nationals having been used during World War II.

Manufacturing.—During 1946, 8.4% of the population was engaged in manufacturing. The number of various establish-

ments was as follows: bread and food products 72; ice, ice cream and ices 47; newspapers and publishers 33; soft drinks 24; meat packing 16; saw mills and lumber mills 16.

Table II.—Mineral Production of Arizona, 1945

Products	Weight	Value
Copper, lb.	574,406,000	\$77,544,810
Gold, oz.	77,223	2,702,805
Silver, oz.	3,558,216	2,530,287
Zinc, lb.	80,452,000	9,251,980
Lead, lb.	45,734,000	3,933,124

Mineral Production.—Because of labour strikes in smelters, which caused a number of mines to stop production, the estimated production for 1946 was decidedly below that of 1945.

(H. A. H.)

Arkansas. Arkansas is an inland state in the south central United States, admitted to the union in 1836. Area 53,102 sq.mi., 377 of which are normally under water.

Pop. (1940) of 1,949,387 amounted to an increase between 1930 and 1940 of 5.1%. The average of inhabitants was 37 persons to the square mile. Population decreased during World War II because of military service and job opportunities in industrial centres elsewhere, but was increasing in 1946. On July 1, 1945, the census bureau estimated the population was 1,779,817. The 1940 census showed 53 towns and cities, 431,910 urban and 1,517,477 rural population. The Negro population, 506,770, was chiefly in the southeast half of the state. Capital, Little Rock (pop. 1940, 88,039). Other cities: Fort Smith, 36,584; Hot Springs, 21,370; Pine Bluff, 21,290; North Little Rock, 21,137.

History.—The principal state officers during 1946 were Ben T. Laney, governor; J. L. Shaver, lieutenant governor; C. G. Hall, secretary of state; J. O. Humphrey, auditor; J. V. Clayton, treasurer; Guy E. Williams, attorney general; C. A. Rankin, land commissioner. All were re-elected in Nov. 1946, for two-year terms, except the lieutenant governor, who was not a candidate. Nathan Gordon became lieutenant governor for 1947 and 1948.

The chief accomplishments of the Laney administration in 1945 and 1946 were the consolidation of the natural resource agencies into one agency, co-operation of the state government with private agencies in economic rejuvenation, improvement in educational funds and improvement in the state's financial position and distribution of state revenues to agencies and services. The governor's program for 1947 and 1948 included continued industrial expansion, new revenues for state highway construction on a cash basis, further debt reduction and expansion of resource protection and development.

Education.—Total expenditures, state and local, for public schools in the school year 1945-46 were \$22,918,587. Total attendance was: white, 245,447; Negro, 76,926; total, 322,373. Per capita expenditure, \$71.90. Teachers totalled 12,242 of which 6,329 were white elementary, 2,040 Negro elementary, 3,362 white high school and 511 Negro high school. The commissioner of education was Ralph B. Jones, beginning his seventh year Jan. 1, 1947.

Social Insurance and Assistance, Public Welfare and Related Programs.—The state in 1946 maintained 30 charitable and correctional institutions, including the state penitentiary farms, the state farm for women, girls' industrial school, boys' industrial school, Negro boys' industrial school, state hospital for nervous diseases, tuberculosis sanatoriums, school for the blind, school for the deaf, Confederate veterans' home and children's home and hospital. The legislature of 1945 appropriated \$4,770,000 for expenditure through the state welfare department for old-age assistance and related benefits in each of the years 1945-46 and 1946-47. Increased appropriations for all these

Table I.—Leading Agricultural Products of Arizona 1946 and 1945

Crop	1946 (est.)	1945
Wheat, bu.	567,000	504,000
Oats, bu.	319,000	384,000
Sorghum grain, bu.	2,088,000	1,815,000
Corn, bu.	448,000	437,000
Cotton lint, bales	140,000	117,000
Grapefruit, boxes	4,300,000	4,100,000
Oranges, boxes	1,270,000	1,210,000
Horses, head	64,000	68,000
Cattle and calves, head	986,000	930,000
Sheep and lambs, head	601,000	586,000

agencies were before the legislature for the next biennium.

Communications.—Highways, local, state and federal, totalled about 75,000 mi. in 1946. About 7,700 mi. of nearly 10,000 mi. on the state system were surfaced with concrete, asphalt or gravel. About \$8,000,000 in contracts for new construction under the federal aid-postwar program were let in 1946. Total highway revenues in 1946 were \$22,000,000, a new high record. Railway mileage was about 5,000 mi. Air service expanded in 1946 and much airport construction work was scheduled for 1947. The corps of engineers, U.S. army, comprehensive plan for navigation of the Arkansas river, across Arkansas and to Tulsa, Okla., was approved by congress in 1946.

Banking and Finance.—In Sept. 1946, there were 210 state and national banks with total deposits of \$754,496,000. Net liquid assets of Arkansas individuals and corporations rose from \$109,000,000 in 1940 to \$1,190,000,000 in 1946, according to the Federal Reserve bank of St. Louis.

The total bonded debt of the state was reduced approximately \$8,000,000 in 1946 to approximately \$125,540,500 on Jan. 1, 1947. Treasury balances totalled approximately \$57,000,000 Jan. 1, 1947, of which about \$27,000,000 was invested in securities earning about \$500,000 annually.

Agriculture.—The total agricultural income in 1946 was estimated at \$435,000,000 gross. Agricultural production was widely diversified, the chief products being cotton, rice, corn, soybeans, peaches, chickens, livestock, berries, truck crops and dairy products. Cotton and rice predominate in the southeast; broilers, fruits, truck and dairy products in the northwest. Canning output increased 300% in the years of World War II, compared with 49% national increase.

Manufactures.—Lumber production from 20,000,000 ac. of forest land was estimated at 1,500,000,000 bd.ft. in 1946.

Gross manufacturing production in 1946 was estimated at \$650,000,000, an increase of \$32,000,000 over 1945. The Arkansas economic council-state chamber of commerce reported a 2-year gain in new industries and important expansions up to Jan. 1, 1947, as: 941 new and expanded enterprises; \$70,183,000 investments; 24,915 jobs; \$42,377,950 annual pay roll. Industrial use of the state's own raw materials predominated in the new plants.

Mineral Production.—Mineral production for 1945 (severance tax records) reflected a total value of \$51,431,536 and included: petroleum 28,567,474 bbl.; natural gas 63,216,688,000 cu.ft.; coal 1,680,035 tons; bauxite 1,000,419 long tons; limestone 299,560 tons; barite 261,406 short tons; cement 711,000 bbl.; chert (roofing) 13,952 short tons; clay 162,658 short tons; gravel 1,726,723 short tons; gypsum 14,446 short tons; manganese and manganiferous ores 7,737 short tons; novaculite (abrasive) 504 tons; dimension and crushed stone 794,286 tons.

(C. F. Bs.)

Arliss, George

(1868–1946), British actor, was born on April 10 in London. He joined a theatrical company at the age of 18 and toured the English provinces. He scored a major triumph in 1900 when he appeared with Mrs. Patrick Campbell in *Mr. and Mrs. Daventry* and in *The Notorious Mrs. Ebbsmith*. He went to New York city in 1901, and appeared in *The Second Mrs. Tanqueray* and in *The Darling of the Gods*. His suave performances captured Broadway, and in the 1907–08 season he was billed with Mrs. Minnie Maddern Fiske in Henrik Ibsen's *Rosmersholm*, Franz Molnar's *The Devil* and in *Septimus*. He made his greatest success, however, in 1911, in the Louis N. Parker play, *Disraeli*. On his return to the London stage after a 22-year absence, he starred in *The Green Goddess*, which ran for 12 months. A superb character actor, Arliss was famed for the skill and finesse of his perform-

ance. He used a minimum of makeup, sported a monocle where possible and preferred the contrasts afforded by sinister characterizations although his comedy roles were enthusiastically received in both England and the United States. In 1929, the adaptation of *Disraeli* in motion pictures brought him new success and he subsequently starred in the screen versions of *The Green Goddess*, *The Man Who Played God*, *Old English*, *The Millionaire*, *Voltaire*, *The House of Rothschild* and *Cardinal Richelieu*. His last film, *Dr. Syn*, was produced in England in 1937. Mr. Arliss was the author of several plays including *The Wild Rabbit* (1899), *There and Back* (1900) and *Widow Weeds* (1910), and two autobiographies, *Up the Years from Bloomsbury* (1927) and *My Ten Years in the Studios* (1940). He died in London on Feb. 5.

Armies of the World.

Statistics covering this subject were not available from official sources during 1946, and the information which was publicly available was not considered reliable. The article was therefore omitted. (For related topics see AVIATION, MILITARY; MUNITIONS OF WAR; SELECTIVE SERVICE, U.S.; WORLD WAR II.)

Arsenic.

Nearly half of the world output of white arsenic comes from the United States and Mexico. The output of the major producing countries is as follows:

World Production of Arsenic

(Thousands of short tons)

	1937	1939	1940	1941	1942	1943	1944	1945
Australia	2.30	1.59	3.73	3.78	3.05	2.56	2.58	?
Belgium (exp.) . . .	3.35	3.67	?	?	?	?	?	?
Brazil	0.79	0.78	1.19	1.29	0.99	0.93	?	?
Canada	0.69	0.87	1.05	1.77	3.92	1.58	1.31	1.02
France	7.17	?	10.16	6.77	2.49	4.12	2.14	?
Germany (exp.) . . .	3.14	1.96	?	?	3.95	6.18	?	?
Italy	—	1.27	1.41	1.32	?	?	?	?
U.S.	11.86	7.79	10.22	14.16	20.41	22.39	16.87	16.55
Mexico	16.81	22.34	24.98	32.48	28.68	31.20	36.09	24.35
United States	16.81	22.34	24.98	32.48	28.68	31.20	36.09	24.35
Total	61.7	69.5	79.2	?	?	?	?	?

United States.—Production declined by one-third in 1945, but remained higher than in any prewar year. Imports increased from 9,965 short tons in 1944 to 13,149 tons in 1945, exports dropped from 2,401 tons in 1944 to 858 tons in 1945, and consumption dropped from 43,500 tons to about 39,000 tons. Insecticides and weed killers absorbed the bulk of the output.

Mexico.—There was only a minor decline in Mexican output in 1945, but the drop after the peak output of 1943 was more than one-quarter, as compared with a one-third drop in the U.S. in 1945.

Canada.—Demand declined, and production decreased from 1,314 short tons in 1944 to 1,016 tons in 1945.

Sweden.—The refining of the byproduct crude arsenic from the Boliden mine was discontinued during the war years, but considerable amounts of the crude were utilized in wood preservation.

(G. A. Ro.)

Art: see AMERICAN LITERATURE; ARCHITECTURE; PAINTING; SCULPTURE; etc.

Art Exhibitions.

Despite transportation difficulties, strikes, and the high cost of labour, there was no curtailment in the number of art exhibitions during 1946. Modern trends became more apparent in the contemporary annuals and in general the chief prizes and honours went to artists working along progressive or experimental lines. Even the staid Pennsylvania Academy of the Fine Arts in its largely invited 141st annual veered very much to the left. Gregorio Prestopino was awarded the much coveted Temple medal for the "Death of Snappy Collins" and Benjamin Kopman's "Landscape" won the Sesnan medal.

Chicago's 50th local annual at the Art Institute inaugurated the new Walter M. Campana prize of \$1,000 which went to Margo Hoff for "Murder Mystery."

Carnegie Institute in Pittsburgh, in an all-invited annual titled "Painting in the United States, 1946," tended in the modern direction despite the sprinkling of conventional portraits. Karl Knaths won the \$1,000 first prize for "Gear," Jack Levine the \$700 second prize for "Welcome Home" and William Gropper the \$500 third prize for "Don Quixote, No. 1."

Industry continued to support art with Pepsi-Cola as the leader in the field. Their third annual "Paintings of the Year," held in the galleries of the National Academy, spread \$15,250 in prize money, the top three being \$2,500 to Boris Deutsch for "What Atomic War Will Do to You," \$2,000 to Carlos Lopez-Rey for "Carnival in Madrid" and \$1,500 to Robert Gwathmey for "Lullaby." The Syracuse Museum, after a respite during World War II, revived the noted ceramic annual on an even more expansive scale. Top ceramic artists from all over the United States submitted their best work and an impressive array of prizes was distributed to such well-known artists as William M. Swallow, Carl Walters, Edward Winter, Marguerite Wildenhaus, Gertrud and Otto Natzler and Henry Varnum Poor.

Important one-man exhibitions featured significant phases in U.S. art. The Whitney Museum assembled 30 canvases by Robert Feke who, next to John Singleton Copley, was the most accomplished portrait painter of the colonial period. George Inness (1825-1894), the noted landscape painter, was given a full-length showing at the George Walter Vincent Smith Art Gallery in Springfield, Mass., later shown at the museums in Brooklyn and Montclair.

Theodore Robinson (1850-1896), who brought the flavour of French Impressionism to U.S. painting, was accorded a comprehensive exhibition at the Brooklyn Museum. In Chicago the Art Institute gave a complete resumé of the work of George Bellows who put new vitality into U.S. painting and revived the art of lithography.

M. Knoedler and Company, veteran New York dealers, celebrated their 100th anniversary with a nostalgic exhibition of the taste of the past century. In like manner the Metropolitan Museum held a 75th anniversary exhibition, the "Taste of the Seventies," featuring such old favourites as Alexandre Cabanel's "Birth of Venus," Rosa Bonheur's "Horse Fair" and paintings by Adolphe Bouguereau and Jean Meissonier. Of far greater importance in the Metropolitan's diamond jubilee was the featuring of three outstanding loans from Europe: Michelangelo's tondo relief of the "Madonna and Child" from the Bargello in Florence; the "Good Shepherd," famous early Christian sculpture from the Vatican in Rome; and Eugène Delacroix' "La Barricade" from the Louvre.

Internationalism was further stressed when 230 U.S. oils and water colours covering the period from colonial times to the present were sent to London for exhibition at the Tate Gallery. British opinion seemed to be that only a few artists like Winslow Homer and Thomas Eakins were truly American, the rest was thought to be inspired by England and France. Two travelling exhibitions were being sponsored by the state department, one being sent to Europe and the near east while the other was to tour Latin America. Seventy-nine pictures were bought outright to make up these good-will art groups.

"Pioneers of Modern Art in America" held at the Whitney Museum gave a most interesting account of the background of progressive movements in the United States. Work by 34 artists were shown including John Marin, Joseph Stella, Max Weber, Marsden Hartley, Man Ray and Alfred Maurer.

One of the most colourful exhibitions of 1946 was the comprehensive showing of the paintings and prints of Marc Chagall

arranged jointly by the Museum of Modern Art and the Art Institute of Chicago. At the latter showing a special installation was designed by Raymond Breinin who was born in the same city in Russia, Vitebsk, as Chagall.

Unquestionably the most dramatic and most unusual exhibition of the year was the "Arts of the South Seas" at the Museum of Modern Art. Carvings, weaving, sculpture and other art expressions of the native tribes inhabiting the islands of the Pacific were arranged and showed the extraordinary sense of suitability of materials, and feeling for colour and design possessed by these islanders.

An important exhibition of paintings by the 19th century French artist, Camille Corot, was arranged at the Philadelphia Museum.

The climax of the year was the loan of paintings by William Hogarth (1697-1764), John Constable (1776-1837) and J. M. W. Turner (1775-1851) from King George VI and the great museums in London, the National Gallery, the Tate Gallery and the Victoria and Albert Museum. This was arranged by the Art Institute of Chicago and, after being shown there, was scheduled for early 1947 at the Metropolitan Museum in New York.

(F. A. Sw.)

Art Galleries and Art Museums.

For the third time Samuel H.

Kress made a gift of major importance to the National Gallery of Art in Washington. Wide variety was shown in the collection numbering 110 works ranging from the 15th to 19th century. Among the outstanding paintings are "The Healing of Palladia by St. Cosmas and St. Damian" by Fra Angelico; a Madonna by Sandro Botticelli; "Adoration" by Fra Filippo Lippi; two pictures by the Sienese master, Stefano di Giovanni Sassetta; "Christ on the Sea of Galilee" by Jacopo Tintoretto; "Cardinal Pietro Bembo" by Titian (Tiziano Vecellio); "Portrait of an Old Woman" by Jean-Baptiste Chardin; "Portrait of Madame Bergeret" by François Boucher; "Madame Moitessier" by Jean Ingres.

Drawings came into prominence as both the Art Institute of Chicago and the Metropolitan Museum displayed the cream of their collections. Chicago's varied group, mostly recent purchases made possible by Mrs. Tiffany Blake, Mrs. Potter Palmer and Carter Harrison, included Paul Gauguin's "Tahitian Woman," Paul Cézanne's "Harlequin," Vincent van Gogh's "Tree in a Meadow," as well as Canaletto's "Ruins of a Courtyard" and a notable 18th century French drawing, "The Letter," by Jean-Honoré Fragonard.

At the Metropolitan, Leonardo to Ingres included such highlights as "Two Nude Figures" by Filippino Lippi; "Cupid Bending a Bow," by Giorgione; "Madonna Adoring the Child" by Leonardo da Vinci; "Study for the Libyan Sibyl" by Michelangelo (Michelagnolo Buonarroti); and six drawings by Ingres.

One of the great acquisitions of the year occurred when the Museum of Fine Arts in Boston purchased a 14th century triptych "The Crucifixion" by Duccio di Buoninsegna, formerly owned by J. P. Morgan and seldom seen as it hung in his English country home at Aldenham. A monumental still life by Jean-Baptiste Chardin was acquired for the Springfield (Mass.) Museum. Signed and dated 1764 it was formerly in the Jacques Doucet collection. After ten years of litigation the John and Mable Ringling Museum at Sarasota was turned over to the state of Florida. With this went the fabulous home of the circus owner which is destined to become a Venetian museum; the two properties together are valued at \$15,000,000.

William Randolph Hearst donated \$100,000 to the Los Angeles County Museum whose collections, as a result, were greatly enriched with purchases which include a 13th century

French Romanesque capital, a 14th century French carved "Madonna and Child," Jacob Jordaens' "Satyr Visiting a Peasant Family" and Peter Paul Rubens' "Sketch of Hercules Killing the Lion."

Edgar Degas' "Frieze of Dancers," an important work dating from about 1880, was purchased for the Cleveland museum. This painting was for many years in the collection of the noted German Impressionist painter, Max Liebermann.

The first major postwar museum building construction to get under way was the Des Moines Art centre. Designed by Eliel Saarinen, the structure measures 380 by 224 ft. and was expected to be completed in 1947.

Major reconstruction was started at the Cincinnati museum where a newly acquired collection of sculpture of first quality was a feature at the fall opening. Egypt, ancient Greece and Rome, China, mediaeval France and Renaissance Italy are represented by sculpture of the best periods in their artistic development.

In Philadelphia the Pennsylvania Academy of the Fine Arts purchased more than \$10,000 worth of contemporary U.S. art. In the group were "Seated Girl" (stone) by Concetta Scaravaglione, "Magic Forest" by John Atherton, "The Round Table" by Abraham Rattner and "Lime Kiln" by Julian Levi.

Nineteenth century U.S. paintings were a feature of purchases during the year 1946 at the St. Louis museum: Thomas Cole's "Dream of Arcadia," George Inness' "Roman Campagna," William Harnett's "With the Staats Zeitung" and a well-known early Winslow Homer, "The Country School" (1871).

A varied group of paintings entered the collection of the Museum of Modern Art in New York and included "The Card Players," (1913-14) by Pablo Picasso, "Front Page" by Stuart Davis, "Two Witnesses" by Ben Shahn and "Republican Automats" by George Grosz. A significant group of U.S. paintings was acquired by the Butler Art institute in Youngstown, O., and included "Street Urchins" by the 19th century genre painter, David Blythe, "Sugaring Off" by Eastman Johnson, "The Oregon Trail" by Albert Bierstadt and "The Portrait of General Cadwalader" by Thomas Eakins.

Progressive trends in contemporary art were stressed in the new acquisitions at the Walker Art centre in Minneapolis. In the group were a wholly abstract composition by Irene Rice Pereira called "Rose Planes," "Landscape with Drying Sails," by Stuart Davis and "The Sleeping Canyon" by Amedee Ozenfant.

With the return of precious objects from war storage, museums had an opportunity to rearrange their collections to advantage. One of the most distinguished new installations was in the department of Egyptology at the Metropolitan museum. The visitor could not only enjoy the finest examples of the art of Egypt but also, through many small objects of every day life, could obtain a clear idea about the customs and beliefs of these ancient inhabitants of the Nile.

Art Treasures and World War II.—Reconstruction of buildings damaged by bombing was proceeding in all the devastated sections of Europe. The vast amount of movable works of art which were carried off by the nazis and secreted in various mines and castles in Germany and Austria were in 1946 fairly well located and catalogued. Three central collecting points were set up at Munich, Frankfurt and Wiesbaden, where displaced art was assembled for examination and identification. Germany's own great collections were stored with the loot from other countries. The best things from the Kaiser Friedrich museum, Berlin, were found in the Merkers mine. In the monastery at Hoenfurth were found two of the greatest private collections in Europe, the Rothschild of Vienna and the Mannheimer of

Amsterdam.

One of the most fabulous discoveries was in the salt mine at Alt Aussee. Here had been placed the objects which Adolf Hitler intended to install in the proposed Fuehrer museum at Linz, the birthplace of his mother. The famous Michelangelo marble Madonna from Bruges was found and was almost immediately returned to Belgium. Nearby was the Ghent altarpiece, masterpiece of Hubert and Jan van Eyck, painted in 1432. Another section of the mine contained 2,000 paintings, among which were collections taken from Amsterdam and Bruges including outstanding works by Frans Hals, Pieter Brueghel, Titian, Rembrandt, Rubens, and Van Dyck. In another section were 6,000 paintings, many from famous Jewish collections, Rothschild, Gutmann and Mannheimer; Jan Vermeer's "Portrait of the Artist in His Studio," from the Count Czernin collection, Vienna; 15 cases of painting and sculpture from Monte Cassino, Italy; and the great treasures of the Naples Museum: "The Annunciation" by Filippino Lippi, "The Crucifixion" by Van Dyck, "Danaë" by Titian, "The Madonna of Divine Love" by Raphael and the "Blind Leading the Blind" by Pieter Brueghel.

Hermann Goering's private collection had been sent by special train to Berchtesgaden just ahead of the French troops, so most of it was still in the train at the time of surrender. Thirty-one trucks were required to transport the collection to the collecting point in Munich. Included was "Christ and the Woman Taken in Adultery," the fake Jan Vermeer made by Hans von Meegeren.

At the castle of Neuschwanstein were found the paintings from the museums of Munich, 2,000 gold objects from the David-Weill collection in Paris and all the records of Alfred Rosenberg who was at the head of the nazi looting task force.

Hidden in a cellar in Nuernberg across the street from Albrecht Duerer's house, was found the great carved altarpiece by Veit Stoss from the church of St. Mary at Cracow, Poland, and the coronation regalia of the Holy Roman empire, a shield, an orb, two swords and the crown of Emperor Conrad (so-called "Crown of Charlemagne").

High lights of the objects assembled at Wiesbaden were the Egyptian head of Queen Nefertete and the crown of St. Stephen of Hungary, dating from the year 1000. (F. A. Sw.)

The exhibit was organized by the National Gallery of Art in Washington, D.C. On the left is John Rothenstein, director of Tate gallery, and on the right is John Walker, curator of the National Gallery of Art

Arthritis. Probably the greatest advance in rheumatoid arthritis has been its recognition and segregation as a condition entirely separate from other disorders of the joints. Consequently, it is possible to classify this disease according to the stage of severity and to weigh the results of treatment according to definite yardsticks. Two investigators set up a "score card" for judging the response to treatment. Several features of rheumatoid arthritis were selected and given set values so that the degree of improvement could be calculated in percentage figures. The criteria chosen included the amount of joint swelling, the degree of joint motion, the amount of joint tenderness, the amount of pain present, the feeling of well-being, the weight loss, and results of certain tests of the blood. By following a method such as this it was believed that different physicians could furnish more consistent information on the value of the various methods of treatment available.

The cause of rheumatoid arthritis remained unknown. For many years workers pointed out that many patients with this type of joint disease developed in their blood a special power to agglutinate certain streptococci. The possible relation of these streptococci to rheumatoid arthritis was considered suspicious. In one study of this factor, about 60% of the patients with rheumatoid arthritis were found to possess an increased agglutination for streptococci. Although gold did not have any specific effect on the agglutination power of the blood there was a lessening or disappearance of the agglutinins of those patients who showed great improvement in the rheumatoid arthritis whether they had received gold treatment or something else.

Although considered a specific disease of the joints, rheumatoid arthritis involves other tissues as well. An inflammation of the muscles, together with nodule formation, was found associated with that disease. These changes were believed to be specific for rheumatoid arthritis and fitted into the general pattern of the other lesions known to occur in the disease.

In arthritis other than the rheumatoid variety, some attention was paid to an epidemic form of arthritis which occurred in Australia, the cause of which was not determined. Also a condition called Reiter's disease, consisting of the combination of inflammation of the urethra, of the conjunctiva and arthritis received attention. Neither the epidemic arthritis of Australia nor Reiter's disease were probably related to rheumatoid arthritis.

Not much progress was made in the treatment of most forms of arthritis. Those types which are due to known germs, such as the pneumococcus, streptococcus, or the gonococcus, could be successfully treated in almost all cases with penicillin or the sulfonamide drugs. Penicillin and the sulfonamides, however, were not effective in rheumatoid arthritis. Gold salts continued to be used with some success in rheumatoid arthritis, although serious side effects were common and gold must be employed with great caution. Muscle spasm is common in rheumatoid arthritis and is the cause of some pain and deformity. Previously neostigmine had been used to relieve spasm. Lately, a drug called physostigmine was tried as a means of helping to prevent some of the deformities of rheumatoid arthritis, to lessen the severity of deformity already present, to simplify the drug used, to lessen the cost to the patient and to relieve pain.

Increased recognition was given to the need for organized research on arthritis and the desirability of increasing the facilities available for the care of patients. With this in mind a National Research Foundation for Arthritis, sponsored by prominent physicians and laymen, was in process of organization at the end of 1946.

Art Sales. An all-time high was reached in auction totals for the 1945-46 season and probably was the peak, for a slight decline in prices was already beginning at the close of the year 1946. The Parke-Bernet galleries in New York announced a total of \$6,684,045. Aside from the fact that prices in general were high, there was an increase in attendance at auctions because of greater interest in painting and art objects and people seem to have become more discriminating in their taste.

Paintings accounted for \$1,210,215 of the Parke-Bernet total, the highest single picture being Rembrandt's "A Pilgrim at Prayer," acquired by Billy Rose at the Willys sale for \$75,000. Frans Hals' "Portrait of Joseph Coymans" went to a New York dealer for \$34,250 and Diego Velasquez' "Portrait of a Girl" brought \$30,000.

Twenty-five paintings from the collection of Sir William Van Horne of Montreal fetched a total of \$221,500. At the top of the list were Henri de Toulouse-Lautrec's "Gueule de Bois" which went for \$30,000, and his "Femme Rousse Assise dans le Jardin de M. Forest" for \$27,500. Paul Cézanne's "Portrait of Madame Cézanne" brought \$34,500. Albert Pinkham Ryder's famous "Siegfried and the Rhine Maidens" was purchased by the National gallery, Washington, for \$23,500, highest price ever paid for a Ryder.

The Eldridge R. Johnson collection of books, prints and drawings brought \$270,499. In this sale a Rembrandt etching, "Presentation in the Temple," sold for \$6,300. Parts 3 and 4 of the Frank J. Hogan library on early English literature sold for \$209,888, and early American furniture, Georgian silver and English china belonging to the actress, Marion Davies, brought \$204,772.

The Plaza Art galleries totalled \$1,441,471.95. Their highest single painting, Jean Baptiste Greuze's "Portrait of a Child" went for \$7,200 at the Maurice Baudler sale. Their most unusual item was a carved stone 17th century French cloister from the collection of George Grey Barnard which sold for \$2,550. A pair of Dresden porcelain vases brought \$1,500 and a dozen Hepplewhite chairs, \$1,650.

In London auction prices maintained a high level. Sotheby sold a full-length portrait, "George Washington as Commander-in-Chief" by Charles Willson Peale, dated 1779 (Earl of Albemarle collection) for £5,700. A "Madonna and Child with Donor" by the rare Venetian master, Bartolomeo Montagna (estate of Violet, Lady Melchett) sold for £8,200. An 87 piece Sèvres dessert set decorated by Pierre Aîné (dated 1767) brought £950.

At Christie's the furniture of Lionel de Rothschild brought top prices, a French Louis XV commode going for £3,990. Furniture and porcelain of the late W. J. Holt totalled £37,806 with £966 for a Queen Anne bureau-bookcase. An Italian gold chalice, dated 1648, brought £1,100 and a silver Monteith (1691) £1,250. Silver belonging to Captain Frederick Montagu totalled £17,977 with six silver-gilt dishes of 1573 bringing £7,000.

Pictures at the Earl of Crawford sale went for £26,769 with top item a "Madonna and Child" attributed to Sandro Botticelli bringing £5,880. Most important was the Lord Swaythling

sale (total £121,996) in which John Constable's famous "Stratford Mill on the Stour," dated 1820, brought £43,050. Thomas Gainsborough's "The Harvest Wagon" brought less than expected, £20,475, and Meindert Hobbema's "Woody Landscape" £11,025. (F. A. Sw.)

Asbestos. In 1945 the sales of domestic asbestos in the U.S. recovered from the decline suffered in 1942-44, reaching 12,226 short tons, double the 1943 low, but only half of the 1941 high. Demand had been declining after 1943, and imports were 374,199 tons in 1945, as compared with 383,049 tons in 1944 and a high of 440,255 tons in 1943. While most of the imports were from Canada, certain war uses required the special properties found only in the South African and Southern Rhodesian products.

In Canada, production increased from 419,265 tons in 1944 to 460,051 tons in 1945, and to 250,217 tons in the first half of 1946. The 1946 rate exceeded the former record high of 477,846 tons in 1941.

The Southern Rhodesian output dropped from 58,293 tons in 1944 to 56,348 tons in 1945, a figure close to that of 1943, but 10% lower than the high of 1942. South African production declined sharply, from 34,582 tons in 1944 and a high of 35,656 tons in 1943, to 21,821 tons in 1945. Swaziland, appearing as a new producer with 7,973 tons in 1939, expanded to 32,659 tons in 1944. No data was available on production in 1945.

The building industry is an extensive user of asbestos in so many forms that the demand in the expanded building program of the next five years was expected to help greatly in cushioning the shock of reduced consumption for war uses.

Asphalt. Production of petroleum asphalt in the United States rose from 6,996,100 short tons in 1944 to 7,126,600 tons in 1945, while sales rose from 6,735,200 tons to 6,851,000 tons. Highway and street construction took 64% of the domestic sales, and roofing 26%. Bituminous rock production dropped from 740,454 tons in 1944 to 642,600 tons in 1945. The native asphalt gilsonite, produced only in Utah, increased from 49,051 tons in 1944 to 61,273 tons in 1945.

Imports of asphalts amount to only a few thousand tons a year, mostly from Trinidad and Cuba, but exports of petroleum asphalt in prewar years exceeded 200,000 tons annually.

(G. A. Ro.)

Assassinations. The assassinations of 1946, actual or attempted, included the following:

Jan. 5. Sir Amin Osman Pasha, Egyptian political leader, was shot and killed by an unidentified assassin.

July 21. La Paz, Bolivia. Young Bolivian student revolutionaries hurled Pres. Gualberto Villarroel from balcony; Villarroel died immediately and his body was hung from a lamp post in the plaza facing the presidential palace.

Nov. 23. Fawzi Hussein, cousin of Jamal Bey Hussein, chairman of the Arab higher committee, was murdered in Palestine, reportedly by Arabs for selling land to the Jews.

Astronomy. New instruments for scientific investigation have often marked the beginning of new eras of scientific discovery and progress. Developments in the field of electronics contributed new instruments to the astronomer during 1946. The application of radar to astronomical observation was dramatized by officers of the signal corps, U.S. army, when they successfully observed radar signals reflected from the moon. Successful radar observation of meteors and microwave radio observation of the sun established radio as an effective instrument for astronomical observation.

* New photoelectric cells of the electron multiplier type provided a marked advance in the precise photometry of stars. These new tubes, which have an antimony-caesium sensitive surface, amplify the photocurrent by means of nine stages of amplification within the tube. Thorough tests of these tubes by G. E. Kron showed them to be about 25 times more sensitive than the photoelectric cells formerly in use. Using the 36-in. refractor of the Lick observatory, Mount Hamilton, Calif., and one of the new multiplier cells, Kron found that he could observe photoelectrically any star he could see visually with the telescope. This was a truly remarkable gain in sensitivity over the cells formerly used. Kron predicted that a few improvements would make it possible to measure the light of faint stars by actually counting the number of photoelectrons. He estimated that a star of magnitude 21.4 at the focus of the 100-in. telescope should give a photocurrent of about 20 electrons per second. This could easily be measured by commercially available counters. An exposure time of 90 minutes is required to photograph a star of magnitude 21.0 with the 100-in. reflector. It seemed likely that the sensitivity of the photoelectric method might soon equal or surpass that of the photographic emulsion.

Another new type of photoelectric cell which is particularly sensitive to infra-red light was developed by R. J. Cashman. This new cell is of the photoconductive type with a sensitive surface of lead sulphide. Preliminary tests of this cell were made at the McDonald observatory, Mount Locke, Texas, by W. A. Hiltner and G. P. Kuiper. The tests showed the cell to be satisfactory for infra-red stellar photometry, with a sensitivity in this region of the spectrum hitherto unattainable.

Solar System.—*The Sun.*—The largest sunspot group ever observed was seen in Jan. 1946. The leading spot of this group appeared around the east limb of the sun on the morning of Jan. 29, but so large was the entire spot group that two days were required for the sun's rotation to bring the entire group into view. The spot group consisted of two large spots and a number of smaller ones. The large following spot had an area of 4,440,000,000 sq.mi., the largest single spot ever observed. The area of the entire sunspot group was 6,300,000,000 sq.mi. Brilliant flares were observed in the neighbourhood of the spots on Feb. 6 and 7. At 10^h. 20^m. Greenwich time on Feb. 7 a magnetic storm began. This magnetic disturbance reached its greatest intensity between 0^h. and 3^h. on Feb. 8, and caused interference in short-wave communications to South America and Europe. The magnetic storm began about 16 hours after the appearance of the intense flares of Feb. 6. The spot group was much diminished in area when it returned to the east limb of the sun on Feb. 26. A bright prominence was observed above the group at that time.

Magnetic storms resulting from the appearance of intense solar flares have been observed many times. The consequent interruption of radio communication is in effect an indirect observation of solar activity by means of radio. The appearance of solar flares affects the ionized layers of the earth's upper atmosphere, and the radio waves which are reflected from these ionized layers are thus likewise affected. During 1946 direct observation of the varying radiation of the sun was made in

radio frequencies. Australian scientists used a microwave radio receiver equipped with a parabolic antenna which had exceptional directional characteristics. When this antenna was pointed toward the sun the microwave radiation of the sun and even the disturbance of the radiation produced by sunspot groups were observed. Similar observations were made in the United States by R. H. Dicke and R. Beringer. Using a carefully calibrated microwave radiometer they were able to measure the effective black body temperature of the sun in radiation having a wave length of 1.25 cm. They found the temperature to be approximately $10,000^{\circ}$ K.

Planetary System.—On the night of Oct. 9–10, 1946, the earth passed close to the orbit of the Giacobini-Zinner comet. A brilliant meteor shower had been predicted, for it was expected that the earth would sweep up some of the swarms of meteoroids which travel in orbits nearly coincident with that of the comet. Bright moonlight made many of the faint meteors invisible. Even so a spectacular shower was observed in the western United States where skies were clear. At some stations observers counted meteors at the rate of one per second. In the eastern United States clouds prevented visual observation, but successful observations were made by radio and radar.

Ten comets were observed during 1946, none of them being of naked-eye brightness. Five were new comets not previously observed. The others had been observed at earlier approaches and special search for them had been made. One of these was the Giacobini-Zinner comet whose accompanying swarm of meteoroids was responsible for the brilliant meteor shower. The discovery of an additional object was announced in Argentina, but this object turned out to be the asteroid Hertha.

Stars.—*Special Stars and Stellar Structure.*—Diameters of a few of the largest stars were measured directly with the beam interferometer, and diameters of a considerable number of eclipsing stars were determined from their light and velocity curves. During 1946 A. E. Whitford succeeded in measuring the angular diameters of four stars by a new method. By using one of the new electron multiplier phototubes with an oscilloscope and motion picture camera, he obtained a high speed record of the variation of a star's light as the star was occulted by the moon. Measurement of the recorded diffraction pattern, provided the star's distance is known, yields the angular diameter. Whitford found that he could successfully measure stellar diameters of from $0''.005$ to $0''.018$ with a probable error of about 10%.

Many attempts were made to explain the observed distribution of energy in the continuous spectrum of the sun and stars. A satisfactory explanation must identify a source of continuous absorption in the stellar atmosphere which will produce the observed distribution of energy in the continuous spectrum and also the observed law of darkening at different wave lengths. It is also necessary to explain the observed relations between colour and effective temperature. Rupert Wildt suggested in 1941 that some of the continuous absorption in stellar atmospheres might be produced by negative hydrogen ions. His preliminary computations were based on poorly determined absorption coefficients, however, and failed to give a satisfactory explanation of the observed energy distribution. During 1946 S. Chandrasekhar and F. H. Breen redetermined the absorption coefficient for negative hydrogen ions. Chandrasekhar showed that with the new coefficient the distribution of energy in the continuous spectrum can be quantitatively accounted for as due to these ions. He also found that observed colour temperatures of main sequence stars of types AO to GO can be explained in terms of continuous absorption produced by neutral hydrogen atoms and negative hydrogen ions. These new results require a very considerable revision and extension of the general theory

of stellar atmospheres. It seemed likely that Wildt's discovery of the continuous absorption of negative hydrogen ions provided the key for the solution of a number of the problems of stellar atmospheres.

The Cepheid variable Polaris has the smallest amplitude of light variation of any Cepheid of its spectral type. Joel Stebbins observed this star photoelectrically in six wave length regions from the ultra-violet to the infra-red. He found a range of amplitude of from 0.166 magnitude at 3530A to 0.036 magnitude at 10,300A. This means that the star changes colour during the light variation, and this corresponds to a change of spectral type from cF6 to cF7.

Phenomena Visible in 1947.—*May 20, 1947. Total Eclipse of the Sun.*—Total phase visible in Chile, Argentina, Brazil, the Atlantic ocean and central Africa. Maximum duration of totality $5^m. 14^s.$ in latitude $1^{\circ} 22'$ north and longitude $19^{\circ} 15'$ west.

June 3, 1947. Partial Eclipse of the Moon.—Visible in Europe, the eastern south Atlantic ocean, Africa, southern Asia, the Indian ocean and Antarctica; the ending also visible in the southwest Pacific ocean and Australia. Maximum eclipse 0.024 moon's diameter.

Nov. 12, 1947. Annular Eclipse of the Sun.—The annular phase visible in the eastern Pacific ocean, Peru and northwestern Brazil. Partial phases visible in western and southern United States, Cuba, Mexico, Central America and northwestern South America. Maximum duration of annular phase $4^m. 3^s.$ in latitude $1^{\circ} 41'$ south and longitude $110^{\circ} 13'$ west.

Atomic Energy. By the start of 1946 it was apparent to the whole world that the control of atomic energy constituted in many ways the most important problem facing the human race. Used in another war it would result in the destruction of civilization. But in its peacetime applications to industry, transportation and other activities, it promised the start of a new era, the Era of Atomic Energy, capable of becoming the most glorious period in the history of mankind.

Three major trains of events in the field of atomic energy held the attention of the world in 1946. The first was the battle in the United States congress over the adoption of a law for the domestic control of atomic energy. The second was the effort of the United Nations Atomic Energy commission to deal with the problem of international control. The third was the atomic bomb tests held by the United States joint army-navy task force 1 at Bikini Atoll. The author was an observer at the first of the two tests at Bikini.

Although there was a general appreciation of the power of the atomic bomb in 1945, its full fury was not appreciated until detailed reports of studies of Hiroshima and Nagasaki were made public in 1946.

Casualties at Hiroshima and Nagasaki.—On June 30, 1946, the war department made public the results of the official investigation of the bombing of Hiroshima and Nagasaki. The report had been compiled by engineers and scientists of the Manhattan project who had access also to data assembled by the U.S. Strategic Bombing survey, the British mission to Japan and the Joint Atomic Bomb Investigating group (medical).

This report stated that Hiroshima suffered 135,000 casualties or more than half of its population. Nearly half, or 66,000, of

Above: NAVY FIREBOAT flushing radioactive materials from the surviving target battleship "New York" after the July 25, 1946, explosion

Above: BOW OF THE U.S. CARRIER "INDEPENDENCE" showing damage done by the blast of the atomic bomb during the first test explosion at Bikini lagoon, July 1, 1946

Below: AIRCRAFT CARRIER "SARATOGA" slowly settling beneath the waters of Bikini lagoon approximately seven and one-half hours after the underwater explosion of the second test bomb on July 25, 1946; radioactivity was too intense to permit salvage men to board it and prevent it from sinking

the casualties were deaths. The greatest number of these occurred immediately after the bombing.

Nagasaki, a city of 195,000, suffered 64,000 casualties according to this report, of which 39,000 were deaths.

The effects of the atomic bombs on human beings were of three main types, the report states: (1) burns, including "flash" burns caused by the instantaneous heat and light radiations, (2) mechanical injuries, resulting from flying debris, falling buildings and blast effects, and (3) radiation injuries due entirely to gamma rays and neutrons emitted at the instant of explosion and similar to the results of severe X-ray over-exposure. The wide ground area over which burns were inflicted was particularly remarkable.

Burns caused about 60% of the deaths in Hiroshima and about 80% in Nagasaki. Falling debris and flying glass caused 30% of the deaths in Hiroshima and 14% in Nagasaki. Radiation caused 10% of the deaths in Hiroshima and 6% in Nagasaki. The investigators reported that no harmful amounts of persistent radioactivity were found in either of the two cities.

Destructive Effects.—The investigators were convinced that the destruction at both Hiroshima and Nagasaki was such as to justify the original statement that the general effect of the atomic bomb would be equivalent to an explosion of 20,000 tons of T.N.T.

In Hiroshima almost everything up to about one mile from the point on the ground directly below the burst was completely destroyed except for the buildings of reinforced concrete. In them, however, the interiors were gutted and doors, sashes, frames and all windows were ripped out. More than 60,000 of the estimated 90,000 buildings in the city were destroyed or severely damaged.

In Nagasaki, reinforced concrete buildings with 10-inch walls and 6-inch floors, situated 2,000 ft. from the point on the ground below the bomb burst, collapsed. At the same distance some 9-inch concrete walls were completely destroyed.

A Weapon of Saturation.—Dr. Philip Morrison, professor of physics at Cornell university and one of the scientists who worked on the bomb, went to Japan at the request of the war department to visit Hiroshima and study the effect of the atomic bomb. He said that the bomb is "pre-eminently the weapon of saturation." He pointed out that it destroys so large an area so completely and so suddenly that the defense is overwhelmed. The bomb knocked out 27 of the 33 fire stations in Hiroshima, killing or severely injuring three-fourths of the fire-fighting personnel. At the same time the bomb started hundreds of fires in the city. Of 298 registered physicians, only 30 escaped injury and were able to care for the survivors. Only 600 of the city's 2,400 nurses and orderlies escaped injury. Every hospital in the city but one was badly damaged. Electric power plants, railroads, telephones and telegraph lines were all put out of commission. Every citizen of Hiroshima had the impression that the bomb had exploded over his own house.

The Battle in the U.S. Congress.—The United States congress was the scene of a protracted battle during 1946 over the adoption of a law for the domestic control of atomic energy. While a considerable number of bills for this purpose had been introduced into congress in 1945, the fight centred about two of them. One was the May-Johnson bill introduced on Oct. 3, 1945 by Senator Edwin C. Johnson (Democrat, Colo.) and Representative Andrew J. May (Democrat, Ky.), chairman of the House Military Affairs committee. May stated that the bill was being introduced at the request of Secretary of War Robert P. Patterson. The other bill, known as the McMahon bill, was introduced on Dec. 20, 1945 by Senator Brien McMahon (Democrat, Conn.), chairman of the senate Special Committee on Atomic Energy, the so-called "McMahon committee."

On Feb. 3, 1946, President Truman issued an endorsement of the McMahon bill. He had originally let the impression be created that he favoured passage of the May-Johnson bill. Major opposition to the May-Johnson bill in the nation came from the great majority of scientists who had worked on the atomic bomb. Almost immediately after the introduction of this bill in 1945 they began to make vocal their objections through hastily formed organizations such as the Atomic Scientists of Chicago, the Association of Oak Ridge Scientists and the Federation of Atomic Scientists. This sudden entrance of scientists into the arena of public affairs was unique in United States history.

The Scientists' Charges.—The scientists charged that the May-Johnson bill had been drawn up to perpetuate the military control over atomic energy which had developed during World War II. They declared that the continuation of such control would make it impossible for atomic scientists to continue their work, that it would destroy the foundations of American democracy and that it would lead to an international atomic bomb race certain to end in World War III.

The Vandenberg Amendment.—Scientists favoured the McMahon bill but the charge arose from other quarters that this bill erred in the opposite direction from the May-Johnson bill, giving the army and navy no voice in matters of direct concern to them.

An amendment to the McMahon bill, first proposed by Senator Vandenberg (Republican, Mich.), on March 12, sought to remedy this by creating a military committee to pass on acts of the proposed Atomic Energy commission. A revised Vandenberg amendment was unanimously adopted by the McMahon committee on April 2 and the bill was reported out by the committee on April 11.

The Bill Is Passed.—The senate unanimously passed the McMahon bill by a voice vote on June 1 after less than two and a half hours of debate.

Continued resistance to the bill was still expressed in the house of representatives and on June 12 the House Military Affairs committee amended the bill to stipulate that two members of the five-man Atomic Energy commission must be military men. Subsequently a stormy fight broke out in the house and on July 20 the house passed the bill after loading it down with amendments unacceptable to Senator McMahon.

The core of resistance to civilian control of atomic energy came from the members of the House Military Affairs committee and the House Un-American Activities committee which insisted that there were spies in the atomic bomb project and that maximum influence in the proposed commission must be given to the army and navy.

The task of ironing out the difference between the two versions of the bill was undertaken by senate and house conferees. A compromise was reached and an amended bill, much more nearly in line with the original bill than with the house version, was adopted by both senate and house on July 26. Thus ended a congressional battle of exceptional length and bitterness.

The McMahon Bill.—On Aug. 1, 1946, President Truman signed the McMahon bill and it became the law of the land under the title of "The Atomic Energy Act of 1946." This act stated that "subject at all times to the paramount objective of assuring the common defense and security, the development and utilization of atomic energy shall, so far as practicable, be directed toward improving the public welfare, increasing the standard of living, strengthening free competition in private enterprise and promoting world peace."

The bill provided for five major programs, namely, the assistance of private research in the field of atomic energy, the dissemination of technical information consistent with national se-

curity, the establishment of federally conducted research and development, the control of the production, ownership and use of fissionable material and the administration necessary to achieving the foregoing purposes.

The principal administrative body established by the bill is the Atomic Energy commission consisting of five full-time civilian members appointed by the president and confirmed by the senate. The chairman is to be paid \$17,500 a year as salary and each of the other four members \$15,000. Only civilians are eligible for these appointments. Subordinate to the commission there is a general manager who is also appointed by the president and confirmed by the senate. The commission is to appoint four division directors to head the division of research, production, engineering and military application. The director of military application, however, may be an army or navy officer.

The bill also provides for a board of civilian advisers to be appointed by the president. This board is to meet four times a year.

Finally, as first proposed in the Vandenberg amendment, there is a military liaison committee appointed by the secretaries of war and navy. This committee is to consult with the commission on all activities relating to the military applications of atomic energy. Upon recommendation from this committee or at their own discretion, the secretaries of war and navy may carry to the president a protest against any act of the commission or any failure to act. In such an event the final decision will be made by the president.

Progress in the United States.—While congress was debating the control of atomic energy, the Manhattan district took a number of important steps to further research into atomic energy and its peacetime applications and to make radioactive isotopes available for medical and other types of research. With the appointment of an Atomic Energy commission by President Truman, as provided for in the McMahon bill, arrangements were made to transfer all activities of the Manhattan district to the commission. This transfer took place on Jan. 1, 1947.

Atomic Energy Commission.—On Oct. 28, 1946, President Truman announced the membership of the Atomic Energy commission. As chairman of the commission he appointed David E. Lilienthal who had made a distinguished record as chairman of the Tennessee Valley authority. The other members appointed to the commission were Dr. Robert Fox Bacher, Cornell university physicist who had worked in the Los Alamos atomic bomb laboratory and later served as scientific adviser to Bernard M. Baruch, American representative on the United Nations Atomic Energy commission; Sumner T. Pike of Maine, business man who had recently been a member of the Securities and Exchange commission; Lewis L. Strauss, New York banker and a rear admiral during World War II in charge of ordnance inspection; and William Wesley Waymack of Illinois, newspaper editor, Pulitzer Prize winner, and an economic and fiscal adviser to various government agencies in World War II.

General approval was expressed in the United States with the president's choice of members of the commission.

On Nov. 4, Secretary of War Patterson and Secretary of the Navy Forrestal announced the appointment of the six-man Military Liaison committee to the Atomic Energy commission. The army membership was headed by Lieut. Gen. Lewis H. Brereton, wartime chief of the Far East 9th and 10th air forces. The other army members were Major Gen. Lunsford E. Oliver and Col. John H. Hinds. Heading the navy membership was Rear Admiral Thorvald A. Solberg, head of the research and standards branch of the shipbuilding division of the bureau of ships. Other members representing the navy were Rear Admiral Ralph A. Ofstie, and Rear Admiral William S. Parsons.

On Dec. 12, President Truman appointed the nine-man Gen-

eral Advisory committee to the Atomic Energy commission. It consisted of James B. Conant, Lee A. Du Bridge, Enrico Fermi, I. I. Rabi, J. R. Oppenheimer, Glenn T. Seaborg, C. S. Smith, Hartley Rowe and Hood Worthington.

Plans for Research.—During the latter half of 1946 the Manhattan district instituted a number of additional steps to expand research in atomic energy. Camp Upton, N.Y., was acquired for the site of an institution to be known as the Brookhaven National laboratory. The contract for its operation was given to nine eastern universities which organized the Associated Universities, Inc., for this purpose. Dr. Philip M. Morse was appointed director. The General Electric co. was authorized to establish a laboratory at the Hanford Engineer works, Pasco, Wash., under the direction of William D. Coolidge. A training school in nuclear physics was organized at the Clinton laboratories at Oak Ridge, Tenn. A contract was given to the Monsanto Chemical Co. to build a \$2,500,000 uranium pile at Oak Ridge for experiments in the development of electric power with atomic energy. The Metallurgical laboratory at the University of Chicago was renamed the Argonne National laboratory and its program expanded. A contract was given to General Electric co. to build a \$20,000,000 research laboratory near Schenectady, N.Y., to be called the Knolls Atomic Power laboratory.

Release of Information.—One of the important problems before the nation in 1946 was the release of some of the information on atomic research in the secret files of the Manhattan district. On Nov. 7, announcement was made that nearly 500 papers, totalling some 2,000,000 words of atomic information had been cleared through the district's "declassification" procedure.

It was planned eventually to publish many of these papers in a Manhattan Project Technical series. It was believed that this series would form a library of more than 100 volumes.

VIEW OF ACTUAL WORK being done within the atomic bomb plant at Oak Ridge, Tenn., during 1946. Dr. Edward Tompkins (right), designer of fission product separation units at Clinton laboratories, demonstrates the remote control operations to Dr. Waldo Cohn, who is observing the course of a reaction taking place inside a heavy concrete cubicle

The declassification policy was based on recommendations of a committee headed by Richard C. Tolman, dean of the graduate school of California Institute of Technology.

Medical and Biological By-products.—As is well known, the medical profession has long made use of both X-rays and radium in the treatment of many diseases including cancer. After the discovery of artificial radioactivity there was considerable research upon the use of radioactive isotopes both as a means of treating disease and as a tool for biological and medical research. Very small amounts of such isotopes were created with the aid of cyclotrons starting in 1934.

Radioactive Isotopes Delivered.—The first delivery to the nation's medical research institutions of radioactive isotopes produced with the aid of uranium piles was announced by the Manhattan district on Aug. 2, 1946. This consisted of pea-sized units of Carbon 14. Barnard Free Skin and Cancer hospital of St. Louis received the first unit for use in cancer research. This small bit of Carbon 14 represented from 100 to 1,000 times as much of the isotope as had ever been made available previously by any single order for a cyclotron-produced isotope. Similar amounts of the isotope were subsequently furnished to a number of other institutions.

National Institute of Health.—The U.S. public health service joined the program of the Clinton laboratories at Oak Ridge on Nov. 5, 1946, with the announcement of the formation of a new division in the National Institute of Health. Dr. Alexander Hollaender, principal biophysicist of the institute, was assigned to Oak Ridge to direct a research into the effect of nuclear radiation upon living cells. The work is to be divided into five general fields, biochemistry, cytogenetics, general physiology, experimental radiology and co-operative studies.

The International Scene.—The way for international action on the control of atomic energy during 1946 was opened when the foreign ministers of the United States, Great Britain and the U.S.S.R., meeting in Moscow, made public the text of an agreement on Dec. 27, 1945. This called upon the general assembly of the United Nations to create an Atomic Energy commission.

The Assembly Acts.—On Jan. 24, 1946, the general assembly of the United Nations, meeting in London, unanimously adopted the resolution proposed by the foreign ministers at Moscow for the creation of an Atomic Energy commission.

Twelve nations were accorded representation on the Atomic Energy

commission. They were the United States, the U.S.S.R., Great Britain, France, China, Canada, Australia, Poland, the Netherlands, Mexico, Egypt and Brazil.

The Acheson-Lilienthal Report.—On March 28, 1946, the U.S. state department made public its "Report on the International Control of Atomic Energy," known also as the Acheson-Lilienthal or the Lilienthal report. It was drawn up for the state department's Committee on Atomic Energy of which Dean Acheson, the undersecretary of state, was chairman, by a board of consultants headed by David E. Lilienthal who, at the time, was chairman of the Tennessee Valley authority.

The members of Lilienthal's board of consultants were J. Robert Oppenheimer, wartime head of the Los Alamos atomic bomb laboratory, Charles Allen Thomas, vice-president and technical director of the Monsanto Chemical co., Harry A. Winne, vice-president in charge of engineering of the General Electric co. and Chester L. Barnard, president of the New Jersey Bell Telephone co.

The members of Acheson's committee were Vannevar Bush, James B. Conant, Maj. Gen. Leslie R. Groves and John J. McCloy, former assistant secretary of war.

Treaties Are Inadequate.—The Acheson-Lilienthal report took the stand that any mere agreement to outlaw the atomic bomb is insufficient and will not work, largely due to the fact that the development of atomic energy for peaceful purposes and the development of atomic energy for bombs are in much of their course interchangeable and interdependent. Thus the only assurance that atomic plants would not be converted to destructive purposes would be the pledged word and good faith of each nation involved. This fact put an enormous pressure upon national good faith and created suspicion on the part of other nations that their neighbours' pledged word would not be kept.

The Denaturing Process.—At the heart of the plan for the control of atomic energy proposed by the Acheson-Lilienthal report is the so-called denaturing process discovered in 1943 but never disclosed until the publication of the report. Even so the report gives no technical details of the process, describing it only in the broadest general terms.

It appears that both Uranium 235 and plutonium can be "denatured." That is, they can be mixed with some substance which has the effect of slowing down the rate at which nuclear fission can take place in these substances. As a result they can be used for the release of nuclear energy for industrial or experimental purposes but they cannot be used for the manufacture of a bomb, for the bomb depends upon a lightning-like chain reaction in which the process of nuclear fission takes place in the entire mass of material in about one ten-millionth of a second.

The denaturants, the report stated, are so difficult to remove that plants comparable to the one at Oak Ridge, Tenn., would have to be built by any nation which sought to purify denatured uranium or plutonium in order to construct a bomb.

The Atomic Development Authority.—Making use of this possibility of denaturing fissionable materials, the report sought to set up a plan whereby every nation could develop the use of atomic energy to the fullest for peacetime purposes while at the same time it would be impossible for any nation to produce an atomic bomb. To accomplish this, it proposed the creation of an international Atomic Development authority or A.D.A.

Every nation would turn over to this A.D.A. the ownership of its uranium deposits. Only the A.D.A. would be permitted to mine uranium or related substances and to purify them. All plants and factories operated by the A.D.A. would be under the jurisdiction of the United Nations and not the nation in which it was located. All Uranium 235 and plutonium manufactured at these plants would be immediately denatured and the denatured material would then be made available to the nations of the world for any peaceable purpose that they saw fit.

The plants for the separation of the fissionable materials and their subsequent denaturing would be distributed strategically throughout the world so that no one nation would contain an undue proportion of them. Should any nation seize an A.D.A. plant for warlike purposes, it would be at the disadvantage of knowing that the rest of the world could immediately convert the other plants to the production of bombs. The fact that it would thus be in a weak position with the rest of the world arrayed against it, would deter any nation from such action, it was believed.

The report advocated that thorium as well as uranium be placed under the jurisdiction of the A.D.A. The reason for this is that thorium undergoes nuclear fission like uranium. A chain reaction cannot be maintained in thorium alone but it can be in a mixture of uranium and thorium. By the use of such a mixture, thorium can be converted into a dangerous fissionable material just as ordinary uranium can be converted into plutonium.

Safe vs. Dangerous Activities.—The plan divided all activities involving atomic energy into two categories—"safe" and "dangerous." All "dangerous" activities would be placed in the hands of the A.D.A. Each nation would be left free to do exactly as it pleased in the realm of "safe" activities. Any activity would be regarded as dangerous if it could contribute to the manufacture of an atomic bomb.

Baruch Appointed.—Bernard M. Baruch, America's "elder statesman," was appointed the United States representative to the United Nations Atomic Energy commission on March 18, ten days before the issuance of the Acheson-Lilienthal report.

On June 14, Baruch presented the "United States Atomic Energy Proposals" to the commission. These closely paralleled the Acheson-Lilienthal report but differed in some respects. They were elaborated in three official memoranda presented later to the commission, "The Control and Development of Atomic Energy" on July 2, "The Functions and Powers of the Atomic Development Authority" on July 5, and "The Relation of the A.D.A. to Other Organs of the United Nations" on July 12.

The Baruch Proposals.—These memoranda proposed the creation of an international Atomic Development authority to control the production and use of uranium and thorium, all fissionable materials and their products. Free access for international inspection was stipulated. There were provisions for specific punishment for illegal possession or use of atomic bombs or materials from which bombs could be made or for seizure of

PHOTOGRAPHIC TOWER AT BIKINI ISLAND, where, six hours after the underwater bomb burst on July 25, 1946, technicians climbed to recover equipment and films

RADIOACTIVE CARBON 14, produced in the Oak Ridge, Tenn., plant, being inspected by Dr. William L. Doyle at the University of Chicago, where it was secured in Aug. 1946 for use in scientific investigation

property belonging to the A.D.A. or for other willful interference with the activities of the A.D.A.

An important feature of the Baruch proposals was that no nation could be protected from punishment for violation of the proposed international control treaty through the use of the veto whether this veto was cast by the violating nation or any other nation possessing the veto power.

The Soviet Proposal.—Andrei A. Gromyko, representative of the soviet union on the United Nations Atomic Energy commission, presented a Russian counter-proposal to the commission on June 19. He stated that the continued production of atomic bombs in the United States was serving to intensify mistrust between nations. He proposed an international agreement to outlaw the production of atomic bombs and to provide for the destruction of all existing stocks of bombs within three months. It seemed clear that the soviet union was resisting the idea of international inspection and that it also opposed any impairment of the veto power.

Position of Other Nations.—The Baruch proposal was supported in principle by the delegates of Australia, Brazil, Canada, China, Egypt, France and the Netherlands. Great Britain and Mexico also went along to a lesser degree. The representative of Poland urged immediate steps to outlaw the atomic bomb as proposed by the Russian delegate.

Two Opposing Views.—It was immediately clear that a wide gulf separated the official views of the United States and the U.S.S.R. The difference of opinion was so wide that many observers feared that it might split the entire United Nations organization. As 1946 drew to a close, however, it seemed as though the tension was beginning to decrease.

A repercussion of the international situation was a sharp interchange of opinion between Baruch and former Vice-President Wallace in September. Wallace's criticism of the American policy brought a caustic reply from Baruch.

The situation looked brighter in December when Foreign Minister Molotov indicated that Russia might decide to agree to a system of international inspection. The situation was also brightened by Russian proposals on disarmament in general which the American delegate to the United Nations general assembly indicated would be acceptable to the United States if they also were extended to include the principle of inspection. While 1946 ended without an international solution of the atomic energy problem, most observers looked forward to 1947 with hope that the year might see decisive action.

The Canadian Spy Case.—The international situation was further disturbed during 1946 by charges of soviet espionage in Canada. On Feb. 15 the Canadian government announced that it had made a number of arrests. In a radio broadcast from Moscow on Feb. 20 the soviet government stated that an attaché in Canada had received "from acquaintances among Canadian citizens certain information which, however, did not present a special interest to soviet authorities." It said the attaché had been recalled and accused the Canadian government of handling the affair in a manner "directly calculated to encourage a campaign hostile to the soviet union in the press and over the radio." The Canadian Royal commission appointed to investigate the incident made two reports, one in March and another in June. No charges were made against the soviet government except that the order for the espionage came directly from Moscow.

Arrest of Dr. May.—British authorities in March 1946 arrested Dr. Alan Nunn May, 34-year-old atomic physicist on charges of disclosing secret information. Appearing in the Bow street police court in London on March 19, May pleaded not guilty.

The Bikini Bomb Tests.—The U.S. navy suggested on Sept. 16, 1945, that the captured Japanese battleship, "Nagato," be used to test the effect of an atomic bomb upon a battleship. This proposal set in motion a train of events that culminated in the summer of 1946 in the atomic bomb tests

at Bikini Atoll in the Pacific. Soon after the navy announcement the army air forces demanded a share in the tests and as a result it was decided to make the event a joint venture of the war and navy departments. The joint chiefs of staff created joint army-navy task force 1 and appointed Vice Admiral William H. P. Blandy as its commander. The name "Operation Crossroads" was chosen for the tests. Bikini Atoll was selected as the site and three tests were contemplated. In the first a bomb was to be exploded in the air, in the second in shallow water, and in the third in deep water.

Bikini Atoll.—Located in the Marshall Islands in the Pacific, six degrees north of the equator, the Bikini Atoll was known prior to World War II as the Escholtz Atoll. It is about 190 mi. east of the island of Eniwetok and about 250 mi. northwest of Kwajalein. The atoll is a coral ring of more than 20 islands of which the principal one is Bikini Island. It is 2½ mi. long. The lagoon inside the atoll is 20 mi. long and 12 mi. wide.

Plans for Operation Crossroads made it necessary to evacuate the natives from Bikini island and accordingly "King" Juda and his 160 followers were moved on March 7 on the LST 1108 to Rongerik island, 130 mi. east of Bikini.

Purpose of the Test.—Admiral Blandy made it clear that there was no intention of any attempt to simulate battle conditions in the test. The chief purpose of the test was "to provide the data which are needed by the army and navy in planning for the future along sound and economical lines." A secondary purpose was "to provide the data which scientists desire" insofar as this did not conflict with the primary purpose.

The Tests Are Postponed.—On March 22, when preparations for the Bikini tests were well advanced with a large part of joint task force 1 at work at Bikini, President Truman announced, without warning, that the first bomb explosion, then set for May 15, would be delayed for about six weeks. The White House announced that this was done to enable congress to keep at work on the legislative program since a large number of senators and representatives wished to see the test.

Joint Task Force 1.—The magnitude of Operation Crossroads was exemplified by the fact that joint army-navy task force 1 included 200 ships and a personnel of 42,000 men. One hundred and fifty aeroplanes were included in the force.

The United States invited each of the nations represented on the United Nations Atomic Energy commission to send official observers and press representatives to the test. American press associations, newspapers, magazines and radio networks were also invited to send a limited number of correspondents.

The Target Ships.—Seventy-five ships were placed in the target area for the first test. The battleship, "Nevada," at the centre of the target area, had been painted with bright orange and white stripes as an aid to the bombardier who was to drop the atomic bomb. The "Nevada" was approximately three miles from the white sands of the palm-fringed beach of Bikini island.

Four other battleships and two aeroplane carriers were placed close to the "Nevada." These included the "Pennsylvania," the "Arkansas," the "New York," the captured Japanese battleship, "Nagato," and two aeroplane carriers, the "Saratoga," and the "Independence."

The other ships were arranged around these seven in an area with a radius of approximately 1,000 yards. They included battleships, cruisers, destroyers, attack transports, submarines and various smaller craft. Among them were two of the oldest and heaviest U.S. cruisers, the "Pensacola" and the "Salt Lake City," and the German heavy cruiser, "Prinz Eugen."

Devices ranging from complex scientific apparatus whose exact nature was a military secret to simple pressure gauges were included in the 10,000 scientific instruments distributed on the 75 target ships and the shore of Bikini Island.

These were supplemented with live animals including goats, pigs and rats. All sorts of equipment ranging from aeroplanes to samples of paint were exposed on the decks of the target ships. Still and motion picture cameras, controlled by automatic devices, were installed on towers on Bikini island and other islands of the atoll.

Drone Planes and Boats.—A spectacular feature of the plans for Operation Crossroads was the use of drone planes and boats. It was planned to fly pilotless planes or "drones" closer to the atomic cloud than a pilot could safely fly.

Plans were also made to use drone boats, controlled from aeroplanes, to take samples of the water in the lagoon immediately after the bomb explosion.

Test A.—The first bomb test at Bikini took place on July 1 (Bikini time). This was usually spoken of as "Test Able" ("Able" is the navy code word for the letter "A"). The ships of task force 1 stood off to sea, approximately 20 mi. northeast of Bikini for the test. At exactly 20 seconds after 9 A.M., the atomic bomb was dropped from the B-29, "Dave's Dream." Major Woodrow P. Swancutt was the pilot and Major Harold H. Wood, the bombardier.

Observers with the task force saw a bright lightning-like flash when the bomb exploded. A ball of fire appeared on the horizon in the direction of Bikini island. It grew rapidly until it appeared three miles in diameter. Then it collapsed as quickly and in its place was seen the atomic bomb cloud climbing into the sky. It rose to a height of five miles in about two and a half minutes. It was a luminous, creamy white in colour, marked with streaks of pink, old rose, apricot, salmon and other pastel colors. The top of the cloud quickly fanned out into the familiar "mushroom."

Ten minutes after the bomb explosion, black smoke began to rise on the horizon, indicating that the bomb had set a number of ships on fire.

The Damage Done.—On July 11, the reports of the two evaluation boards were made public. The members of the evaluation board of the joint chiefs of staff were Karl T. Compton, chairman, Bradley Dewey, deputy chairman, Thomas F. Farrell, Gen. Joseph W. Stilwell, Lieut. Gen. Lewis H. Brereton, Rear Admiral W. R. Purnell and Rear Admiral R. A. Oistie. Their report can be summarized as follows:

When the bomb exploded, a destroyer and two transports sank promptly and another destroyer capsized. It sank later, and the Japanese cruiser "Sakawa" sank the following day. The superstructure of the submarine "Skate" was badly damaged. The light carrier "Independence" was badly

wrecked by the explosion and gutted by fire. All of these vessels were within one-half mile of the explosion point. Numerous fires were started on other ships. The only major combatant ships within one-half mile of the explosion point were the battleships "Nevada" and "Arkansas" and the heavy cruiser "Pensacola." The superstructures of these were badly wrecked and they were unquestionably put out of action and would, along with many others within three-fourths of a mile, have required extensive repairs at a principal naval base.

Examination of the flashburn effects produced by the initial radiation from the explosion indicate that casualties would have been high among exposed personnel but persons sheltered within the hull of a ship or on deck in a shadow would not have been immediately incapacitated by burns alone. However persons within the area of extensive blast damage to ship superstructures, even though within the ships, would have been exposed to a lethal dosage of radiological effects.

Essentially the same conclusions were given in the report of the president's evaluation board. The members of this board were Senator Carl A. Hatch (Democrat, New Mexico), Representative Walter G. Andrews (Democrat, New York), Edward U. Condon, Karl T. Compton, Bradley Dewey, William S. Newell and Fred Searls.

Test B.—The second test at Bikini, frequently referred to as "Test Baker" ("Baker" is the navy code word for "B"), took place at 8:35 A.M. on July 25 (Bikini time). The bomb was exploded "well below" the surface of the lagoon. It had been suspended from LSM-60 near the centre of the target array.

At the moment of explosion, a luminous dome rose on the surface of the lagoon, followed by an opaque cloud that enveloped about half of the target area. The cloud disappeared in two seconds, revealing a column of ascending water which lifted the 26,000-ton battleship "Arkansas" into the air for a brief moment. The diameter of the column of water was about 2,200 feet and it rose to a height of 5,500 feet, sending spray still higher. It was estimated that the column contained 10,000,000 tons of water.

The base of the column was surrounded by a wall of water several hundred feet high, while waves going outward from the explosion were from 30 to 100 ft. high even at a distance of 1,000 ft. However the waves diminished rapidly and were only seven feet high at Bikini Island, about three miles from the explosion point.

Reports of Damage.—The evaluation board of the joint chiefs of staff, reported that two major ships sank, the battleship "Arkansas" immediately, and the heavy-hulled aircraft carrier, "Saratoga," 7½ hours later. A landing ship, a landing craft and an oiler also sank immediately while the destroyer "Hughes," in sinking condition and the transport, "Falcon," badly listing, were later beached. The submerged submarine "Apogon" went to the bottom and one to three other submarines were believed to have sunk. The badly damaged Japanese battleship, "Nagato," sank five days later.

The board reported that the explosion produced intense radioactivity in the waters of the lagoon. The radioactivity immediately after the burst is estimated to have been the equivalent of many hundreds of tons of radium. Exposure to it would have incapacitated personnel and caused death within a few days or weeks.

The target ships were showered with radioactive water so lethal that four days after the test it was still unsafe for inspection parties to spend "any useful length of time" in the centre of the target area or on the ships anchored there.

Comparison of the Tests.—The president's evaluation board devoted part of its second report to a comparison of Test A and Test B. After calling attention to the fact that both bombs sank some ships, it concluded that the ships remaining afloat appeared to suffer more damage from the aerial explosion but that the effects of persistent radioactivity on personnel would have been much greater in the second.

Test C Is Cancelled.—On Sept. 7, 1946, President Truman announced that the contemplated "Test Charlie" (navy code-word for "C"), had been cancelled. The original plan was to explode a bomb at a considerable depth below the surface of the open ocean in this test.

The Future of Atomic Energy.—Scientists agree with Admiral Blandy that Operation Crossroads was well named. They feel that all mankind stands today at the crossroads. One road leads to an international atomic armament race certain to end in World War III and the destruction of civilization. The other road leads to the peaceful development of atomic energy for the good of all humanity.

Defenses Against the Bomb.—Scientists were convinced that there are no defenses against the atomic bomb itself, only against possible carriers such as planes or rockets. In addition there exists the danger of bombs smuggled in by saboteurs. Scientists believed that in the event of an atomic bomb race it would be necessary to abandon all large cities and spread the population throughout the countryside so that a bomb might destroy a village but not a city. Factories would have to go underground in deep mines or in tunnels under mountains.

The Future of Navies.—It is apparent that the future of navies must be studied in the light of the Bikini tests. Scientists pointed out that it is not enough to consider the problem of one atomic bomb against a fleet but the combination of several, some exploding in the air, some in the water. It seemed obvious that two atomic bombs, one exploding in air and the other under water, would completely wreck any attempt at an amphibious landing. One question that arose was whether a fleet would dare enter a harbour or even narrow waters in time of war.

In Another World War.—Scientists visualized the combination of atomic bombs with many other types of offensive weapons, for example, rockets travelling in the stratosphere with supersonic speeds. They were convinced that the first 24 hours of World War III would see the complete destruction of the principal cities of the contending nations. They were certain that World War III would be fought with rockets bearing atomic bombs, with radioactive poison gases which are easily made as by-products in atomic bomb plants and with methods of biological warfare for the wholesale distribution of blights and rusts capable of destroying crops and of disease germs and viruses capable of starting terrific epidemics among farm animals and human beings.

Peacetime Possibilities.—Physicists believed in 1946 that the development of uranium piles for the generation of power was possible in the near future. The simplest method proposed was to use the energy to heat water to steam which would operate turbine-generators for the production of electricity. Such piles would need extremely careful shielding to prevent the escape of neutrons and harmful radiations into the surrounding neighbourhood.

Many physicists believed that such power plants might be made small enough to be installed in ocean liners but they did not see how they could be made small enough for use in automobiles or aeroplanes. (See also CHEMISTRY; METALLURGY; PHYSICS; URANIUM.)

Attlee, Clement Richard (1883–), British prime minister, was born in London on Jan. 3, 1883. He was educated at Haileybury college, Hertfordshire, and at University college, Oxford. As a young man he earned his living as a docker in the East End of London in order to study social conditions there. In 1905 he was admitted as a barrister to the Inner Temple, and in 1913 he became lecturer in social science at the London School of Economics. Returning from World War I with the rank of major, he was elected mayor of Stepney in 1919 and member of parliament for Limehouse in 1922. After a brief term of office in the first Labour government he went to India as a member of the Simon commission in 1927. He held office again in the second Labour government, first as chancellor of the duchy of Lancaster and then as postmaster general, and in 1931 became deputy leader of the party in the house of commons. In 1935 he was made leader of the party and remained as leader of the opposition until he joined the Churchill coalition government in 1940 as lord privy seal, later to become deputy prime minister. On the victory of the Labour party in the general election of July 1945 he automatically became prime minister and at the same time first lord of the treasury and minister of defense. Two days after his appointment he flew to Potsdam to complete the discussions of the Big Three in Churchill's place.

On Jan. 10, 1946, Attlee welcomed delegates to the London meeting of the United Nations general assembly on behalf of the government, and in July he led the British delegation to the Paris peace conference in place of Ernest Bevin, who was prevented by illness from attending. During April and May he presided over meetings of the Commonwealth ministers at 10 Downing street. In December he received the Indian leaders and the viceroy in London, taking the chair at the final discussion on Dec. 6.

At the end of the year he relinquished his post as minister of defense to A. V. Alexander.

Auriol, Vincent (1884–), French statesman, was born on Aug. 27 at Revel (Haute-Garonne department), France. After receiving his degree of doctor of laws at the Faculty of Law in Toulouse, he practised law in that city. In the early 1900s, Auriol founded the newspaper, *Le Midi*. Entering politics, he was elected to the chamber of deputies as Socialist member for Muret in 1904, and was successively re-elected up to the collapse of France in June 1940.

Auriol's first cabinet post was in Blum's popular front government in 1936 when he was appointed minister of finance. In that capacity he negotiated the tripartite monetary accord with the U.S. and Great Britain. He was minister of justice in the Chautemps government, 1937–38, and held a cabinet post in the second and short-lived Blum government in 1938.

Auriol, who was among the French parliamentarians who protested against Marshal Henri Pétain's efforts to establish totalitarian rule after the armistice of 1940, was imprisoned

by Vichy authorities for several months but was later released. In Oct. 1943, he escaped to London where he joined Gen. Charles de Gaulle's movement. He became a member of the assembly set up in Paris after its liberation in Aug. 1944.

In Nov. 1945 he was appointed minister of state without portfolio in the De Gaulle government. He was named president of the French constituent assembly on Jan. 31, 1946, and was twice renamed to the post during 1946. On Jan. 16, 1947, Auriol became the first president under the constitution of the Fourth Republic; he was elected by 452 votes out of 883 cast by the combined houses of the national assembly meeting at the Palais de Versailles.

Austin, Warren Robinson (1877—), U.S. statesman and politician, was born in Highgate, Vt., Nov. 12. He was graduated with a Ph.B. degree from the University of Vermont at Burlington in 1899 and was admitted to the bar in 1902. He was elected to the U.S. senate on the Republican ticket in 1931 to fill out an unexpired term and was re-elected in 1934 and 1940.

Austin, who campaigned against the League of Nations in the aftermath of World War I, altered his views on U.S. participation in a world peace organization during his membership on the senate foreign relations and military affairs committee. He took a major role in the fight to amend the Lend-Lease act and was co-author of the first Selective Service act legislated in 1940.

On June 5, 1946, President Harry S. Truman appointed Austin as U.S. representative on the United Nations Security council and the following month (July 18) he was named head of the U.S. delegation to the general assembly. Austin resigned from the senate Aug. 2 to devote his time to his new duties. On Jan. 8, 1947, Pres. Truman nominated Austin as U.S. representative on the U.N. Security council, and on Jan. 10 the president, following the recommendation of Bernard Baruch, also named Austin as U.S. member on the U.N. Atomic Energy commission.

Australia, Commonwealth of. A self-governing member of the British commonwealth of nations, situated in the southern hemisphere. Area: 2,974,581 sq.mi.; pop. (est. June 30, 1946) 7,446,300. Chief cities (pop. Dec. 31, 1943): Canberra (capital) (12,200); Sydney (1,398,000); Melbourne (1,170,000); Adelaide (362,500); Brisbane (370,500); Perth (263,000); Hobart (70,800); Newcastle (120,000). Language, English. Religion, Christian (census 1933: Anglican 2,565,118; Roman Catholic 1,161,455; Presbyterian 713,229; Methodist 684,022; other Christians 603,914). Ruler, King George VI. Governor general in 1946, the duke of Gloucester. Prime minister, Joseph Benedict Chifley.

History.—On Sept. 28, 1946, general elections took place for all seats in the house of representatives and for 19 of the 36 seats in the senate. At the same time, electors were called upon to vote in three referenda to empower the commonwealth parliament to legislate on (1) social services, (2) organized marketing of primary produce, and (3) terms and conditions of service in industry. The result of the elections was that the Labour government was returned to power for a further term of three years. This was the first time in history that the Australian Labour party, having won a general election, had been given a renewed mandate three years later. In the house of representatives Labour lost seven seats, three to the Liberal party, two to the Country party and two to independents, and gained one seat from the Liberals. Strengths in the new parliament were to be Labour 43; Liberal 17; Country party 12; independents 2. All states except Queensland returned labour members to the senate so that, after July 1, 1947, the government majority in the upper house would be 33-3, compared with 21-15 in 1946. In

FIRST AUSTRALIAN-BUILT LINCOLN BOMBER receiving final adjustments prior to a test flight at Melbourne in March 1946

the referendum, the proposal to increase commonwealth powers for social service legislation was accepted, but the other two proposals were rejected.

The most important legislation enacted during the year included wheat stabilization, which guaranteed farmers a fixed home price of 5s.2d. a bushel for the next five seasons (if the export price exceeded the guaranteed price, 60% of such excess was to be paid into a fund to assist in paying the guaranteed price when export prices fell below it); coal industry control; atomic energy control (of materials); and the telecommunications bill, which provided for government ownership of overseas telecommunications. An important amendment was also made to the Patents act, which provided protection to the patentee during the waiting period, during which his patent specifications were open to examination prior to the grant of patent.

A government-assisted migration scheme was announced which provided free passages for suitable men and women who had served in the armed forces and merchant navy and for their dependents, and assisted passages to approved migrants resident in Great Britain. The cost was to be shared by the Australian and British governments and aimed at a flow of 70,000 migrants per annum as soon as shipping facilities became available, to operate so long as favourable conditions for settlement in Australia were known to exist.

At the premiers' conference a plan for the standardization and modernization of Australian railways at a cost of £A200,000,000 was approved, as was the wheat stabilization plan. The states also agreed to the indefinite extension of a uniform tax by which the commonwealth remained the sole authority for levying income tax.

External Affairs.—Australia was strongly represented at the Paris Peace conference, as well as at the various other international conferences which were held both in America and Europe. The government regarded an international agreement on employment policies as the foundation stone of international economic collaboration and the achievement by all nations of full employment as the prerequisite to the restoration of international trade. Australia was also anxious to see some agreement reached for the removal of unrestricted trade barriers, but would concede tariffs and preferences only in return for fully-compensating concessions by other nations. In framing peace treaties, Australia's attitude was that all nations which took an active and sustained part in the war against the axis had both the right and the obligation to take part in the peace settlements and that the terms of those settlements should be based

on the Atlantic and United Nations charters.

In the field of external representation, Australia and the U.S.A. raised their legations to the status of embassies and N. J. O. Makin, minister for the navy, resigned his seat in parliament to take up the post of first Australian ambassador to Washington. J. A. Beasley, another minister, resigned to take up the post of high commissioner in London. Legations were also opened in Santiago and The Hague and high commissioners were appointed in the Union of South Africa and in Eire.

Public Finance and Economic Affairs.—In common with most other countries, the financing of war expenditure found Australia facing a danger of inflation owing to the larger spending power in the hands of the public and a shortage of consumer goods. The danger was fully recognized by the government, whose policy it was to encourage a greater production of essential goods. To this end, rapid demobilization of the armed forces and reabsorption into industry of the released labour was the first aim. This was coupled with the removal of many forms of control that tended to hinder business and restrict production and the early transition of war factories to peacetime production. Price control was also to be continued until a stable economic condition had been achieved. Industrial unrest was, however, very widespread and, if loss of production owing to strikes was to be avoided, the government's anti-inflation measures would have to be offset to some extent by a relaxation of wage-pegging controls.

Overseas trade for the year ended June 30, 1946, resulted in an export surplus of £A19,955,000 inclusive of bullion and specie, compared with an adverse balance of £A80,804,000 the previous year. Exports of merchandise showed an increase of 22% while imports dropped 16.5%. The volume of trade was still well below prewar levels and the recent recovery in trade figures was largely due to changing values. There was some cause for anxiety in that, while import prices had doubled after 1939, the export price index had risen by only approximately 60%. On the other hand, large-scale contracts for the disposal of primary produce in the years following 1946 were concluded, which ensured a reasonable return to producers.

Owing to the general elections, no budget was brought down during the life of the last parliament. On July 12, however, the prime minister and treasurer, Mr. Chifley, made a financial statement which contained important financial proposals for a reduction of taxation as from July 1 and for a liberalization of the eligibility for invalid, widows' and old-age pensions. War expenditure in Australia for 1945-46 amounted to £A340,000,000 compared with the estimate of £A298,000,000. Nonwar expenditure equalled the estimates at £A132,000,000 while overseas war expenditure at £A38,000,000 brought total expenditures to £A510,000,000. Revenue amounted to £A356,875,000 and the deficit of £A153,125,000 was financed wholly from the proceeds of borrowing from the public. This means that, during 1945 and 1946, the government met the whole of its war expenditure without recourse to treasury bills or any other form of central bank credit.

Education.—In 1941: state schools 9,535, average attendance 732,116, teachers employed 32,066; private schools 1,863, average attendance 256,500, teachers 11,369; technical schools 101, total enrolment 108,232, teachers 3,810; business colleges 123, total enrolment 24,562, teachers 736; universities 8, total enrolment 10,761.

Banking and Finance.—Revenue (est. 1946-47) £A385,000,000; expenditure (est. 1946-47) £A444,000,000 (ordinary £A223,000,000; defense and postwar charges £A221,000,000). Revenue (actual 1945-46) £A356,875,000; (est. 1945-46) £A340,284,062; expenditure (actual 1945-46) ordinary £A132,000,000; defense £A378,000,000; estimated (1945-46) ordinary

£A132,000,000; defense £A360,000,000. Public debt (June 30, 1945) £A2,702,380,937; notes issued (June 30, 1945) £A186,463,750; gold and sterling reserve (June 30, 1945) £A50,857,812; exchange rate £A1=319.8 cents U.S.

Trade and Communications.—Overseas trade 1945-46 (merchandise): imports £A194,575,000; exports £A189,493,125. Communication and transport: roads (1941) total mileage c. 455,000 mi.; railways open to traffic (1945) 27,144 mi.; airways (1944-45), distance flown 14,992,000 mi.; mails carried 3,209,000 lb.; motor vehicle registrations (Dec. 31, 1945): cars 512,393, commercial vehicles 306,445, cycles 63,945; wireless receiving set licences 1,484,453; telephones, number of lines, 591,789.

Agriculture, Manufacturing, Mineral Production.—Production (in short tons): wool (1945) 508,650; wheat (1945-46) 4,328,400; oats (1944-45) 225,000; barley (1943-44) 190,000; maize (1944-45) 170,000; cane sugar (1944-45) 750,000; butter (1944-45) 153,000; gold (1945) 655,000 fine oz.; coal (1945) 14,328,000; pig iron (1944) 1,462,000; copper (1944) 31,360; lead (1944) 212,220; tin (1944) 2,850; zinc (1944) 195,225. Total value of production (1943-44): pastoral and dairying £A244,545,000; mineral £A27,459,375; manufacturing £A366,235,000. Labour and employment: employment in factories (1937-39=1,000) (Feb. 1946) 1,283; number (Feb. 1946) 731,000; unemployment (trade union returns) (Feb. 1946) 1.4%. Total output of factories (1943-44) £A891,739,000. (See also NEW GUINEA.) (W. D. MA.)

Australia, South: see SOUTH AUSTRALIA.

Austria. A republic in central Europe, area 32,369 sq.mi.; pop. (1934) 6,759,062 of whom more than 90% were Roman Catholics. Capital: Vienna, pop. (1939) 1,918,462. Other cities (with 1939 pop.): Graz 210,175; Linz 131,423; Salzburg 79,264; Innsbruck 80,084. President (1946): Karl Renner; chancellor: Leopold Figl.

History.—On Dec. 20, 1945, Dr. Karl Renner, the veteran Social Democrat, was unanimously elected president of the republic to serve for six years. The government represented a coalition of all parties. According to the outcome of the elections the Catholic People's party as the strongest party received the chancellorship, the ministry of foreign affairs and several other cabinet posts; the Social Democrats as the second strongest party received, in addition to several other ministries, that of the interior; the communists, who had shown only a negligible strength in the elections, received the ministry of electrification. Leopold Figl, the leader of the Catholic People's party, became chancellor.

Though in such a way a constitutional government for Austria had been established and though Austria had been promised the re-establishment of its independence, the land continued under the occupation of the four powers during 1946. The U.S.S.R. occupied all the industrially important parts of the country, the provinces of Lower Austria in which Vienna is situated (which, however, was constituted as an enclave under four-power control), of Burgenland and the northern part of Upper Austria. The southern part of Upper Austria and the province of Salzburg formed the U.S. zone; the provinces of Carinthia, including the eastern part of Tirol and of Styria were occupied by the British, and the French were in control of the provinces of Tirol and Vorarlberg. It was especially the soviet occupation which put a heavy burden on Austria's economic life, both on its food supply and on its industrial equipment. Throughout the year the Austrian government tried to ease the burden and to limit the occupation forces. In that endeavour it was generally supported by the U.S. and British

FLAK TOWER IN VIENNA erected by the nazis. Because of danger of damage to surrounding buildings, structures of this sort were not destroyed, but it was decided in 1946 to leave them as pedestals for United Nations Victory monuments

representatives in the Allied Control commission.

In the economic field Austria tried to steer a middle way between a free economic system and the necessary state planning to undo the immense damages of the World War II years. By the end of the year a plan was laid down for economic reconstruction to make the country self-supporting with Allied help over four years. For 1947 a program of imports for the metallurgical, chemical, machinery and consumer goods industries for a total of \$95,000,000 was set up as against which Austria was to export textiles, paper products, metals and machinery, timber and wooden houses and electric power.

The economically critical situation in Austria was aggravated by the large requirements of food for the very numerous soviet army of occupation and by the soviet attempt to declare most Austrian industries German property and therefore "war booty" to be seized by or removed to the U.S.S.R. One of the most important properties in question was the oil fields at Zistersdorf. The Allied inability to agree on the definition of nazi or German assets strengthened the soviet position. The U.S. representatives in Austria strove, on the other hand, to give the Austrian government control of its indigenous resources including the right of unrestricted movement of these resources throughout Austria. In July a communication from President Harry S. Truman was delivered to the Austrian government opposing the soviet claims on Austrian assets, and agreeing to turn over to the Austrian government all German assets located in the U.S. zone. The British government supported the U.S. stand. The Austrian government, to strengthen its claims, decided to nationalize a large part of Austria's big industry, including mines, iron and steel works, locomotive and electrical plants, chemical factories, oil wells and banks.

At the end of June the authority of the Austrian government was broadened. The Allied Control council agreed to give the government more freedom to pass domestic laws and make international agreements, the functions of the Allied council becoming supervisory rather than administrative. The one-power veto over Austrian legislation other than constitutional provision was removed. In Dec. 1946 a sudden change in the soviet attitude occurred. The soviet authorities accepted the U.S. viewpoint and agreed to proposals which promised considerably to ameliorate the food and economic situation. All of Austria's indigenous food resources of the four occupation zones were to be pooled and the Austrian government was to handle distribution. Imported supplies of food also were to be placed in the common pool, provided indigenous supplies were not withheld. The ration was to be uniform for all of Austria. It was not to fall below 1,200 calories and was to be raised as quickly as possible to a 1,500-calorie level. It was decided to start the new food program on Jan. 4, 1947. An agreement was reached at the same time about denazification measures, including a cleansing of the teaching staff and the student body of the University of Vienna.

In foreign affairs the Austrian government tried hard to regain the German-speaking part of the formerly Austrian South Tirol from Italy. In spite of the Austrian ethnical character of the region, the victorious powers decided to leave South Tirol to Italy. The Austrian government succeeded in arriving at an agreement with Italy to alleviate the situation of the Tirolese under Italian domination and to secure for them a limited local autonomy. Yugoslavia continued to raise the demand for the southern part of Austrian Carinthia. The Austrian government, referring to the outcome of the plebiscite in that province at the end of World War I, rejected this demand.

Automobile Industry. The first full calendar year of peacetime production in the automobile industry fell far short of expectations, by manufacturers themselves as well as the public, prevalent from Aug. 1945 to the end of the year. Actual output reached only 2,145,000 passenger cars, 933,000 trucks and buses, or a combined total of 3,078,000 units. This is less than 64% of the number of units produced in the prewar year 1941, which in addition to the cars and trucks also produced nearly \$500,000,000 worth of armaments.

Production of civilian motor trucks however established a new high record exceeding the previous high watermark of 893,085 in 1937 by a wide margin. The 1941 civilian truck pro-

duction was lower than 1946 if the 218,880 military vehicles produced are excluded.

During the year 1946 factory sales to the United States domestic market were approximately 2,005,000 passenger cars and 741,500 motor trucks, while shipments to foreign markets were 139,800 passenger cars and 182,200 trucks. The proportion of motor vehicles exported was approximately the same as in the four prewar years with 6.3% of passenger cars and 19.7% of motor trucks shipped to other countries. The Civilian Production administration and the Foreign Economic administration limited the exports of each manufacturer to the average for the four prewar years so that the over-all total foreign sales of the industry could likewise not exceed the proportion exported in the base period. In fact, additional motor trucks could have been exported since the over-all ceiling was approximately 20.4%.

A classification of motor truck production by size indicates that there were greater increases in the output of heavy duty vehicles than in the lighter types, in 1946 as compared with 1940. A direct comparison by detailed size groups is not possible, for the reason that manufacturers of motor trucks changed their method of rating trucks after the end of World War II to a gross vehicle weight basis, instead of by manufacturer's rated carrying capacity. However, the number of trucks produced in 1946 with a g.v.w. of 16,000 lb. and more, which approximately represents the prewar 2½ ton and over groups, comprised 6.7% of all trucks produced as compared with 4.9% of all trucks produced in 1940. Conversely, in 1946, 93.3% of all trucks produced had a g.v.w. rating of less than 16,000 lb. compared with 95.1% of all trucks produced in 1940 with the rating of less than 2½ tons.

The reasons for the disappointing showing of the automobile industry in 1946 are many and complex. The major factors handicapping the industry were (a) work stoppages in major industries such as steel, coal and railroad transportation, as well as large and small strikes within the motor vehicle manufacturing industry itself and parts supplier plants, (b) shortages of raw materials such as steel, pig iron, lead, copper, tin, compounded by strikes in those raw material industries, and (c) strait-jacket regulations imposed by the federal government in its efforts to control prices and the distribution of scarce materials.

Attempts were made during 1946 to estimate the number of vehicles that might have been produced if there had been no shortages of materials or shortages of semifinished or finished parts or the number of vehicles that could have been produced if there had been no strikes in motor vehicle plants; but it was discovered that it was impossible to disentangle the shortages resulting from strikes from the genuine shortages of raw materials and parts due to the tremendous demand for materials of all kinds by all industries which had been curtailed or discontinued during the war period. However, under ideal condi-

tions of no shortages and no strikes the motor vehicle industry could have achieved capacity production by mid-1946 and maintained that level to the end of the year. Under such utopian conditions the industry could have produced close to 5,500,000 passenger cars and trucks.

The year 1946 opened with a strike under way in the largest automobile company, begun Nov. 21, 1945, and continued until the first week of April 1946. The strike in the glass industry, begun in 1945 and carried into the new year, kept some plants closed during the first part of January. About the time plate glass production resumed, strikes in other basic industries began to seriously affect automobile production, namely, steel, copper and electric industries strikes. On April 1, the coal strike laid its deadening hand on the industry, not releasing its grip until the middle of May. This was followed closely by the railroad strike, which fortunately was settled after a few days.

During this first half of the year numerous strikes in key supplier plants likewise put a strait jacket on operations which in some cases even forced a shut-down of final assembly lines of motor vehicle manufacturers. The main shortages of material and parts were glass, motor bearings, axle housings, seat cushion springs, valve springs, frames, transmissions, fuel pumps, cylinder blocks, bumpers, pig iron and gray iron castings, wheels, sheet steel, bodies, crank shafts, forgings, gear blanks, nuts and bolts, radiator cores and other items.

During the last half of the year primary shortages in certain factories were sheet steel, pig iron castings, nuts and bolts, cylinder blocks, sheet and strip steel, bodies, cushion springs, body hardware, brake fluid, glass because of insufficiency in the raw material for making glass (soda ash), batteries, clutches, brake drums, hoods, radiator cores, but the principal limiting factor was the lack of sufficient steel, especially sheet and strip.

It may be of interest to note that in the calendar year 1941 the steel industry shipped to the automotive industry 8,881,000 tons of steel or 14.3% of total finished steel shipments. In 1946 figures were available only for the first six months indicating that the steel industry shipped less than 12% to the automotive industry. The automotive percentage of the total finished steel shipments in the calendar year 1941 and the first six months of 1946 as compiled by the American Iron and Steel institute are given in Table III.

Table III.—Automotive Industry Per Cent of Steel Shipments to All Industries

	1941 Year	1946 (1st 6 months)
Ingots, billets, slabs	6.15	9.72
Wire rods	6.37	2.60
Structural shapes	0.637	1.30

Tool steel	11.0	1.1
Pipes and tubes	1.57	1.83
Wire products	6.52	3.82
Black plate	1.03	0.617
Tin andterne plate	0.239	0.201
Sheets and strip	32.7	23.7
Other products	0.618	0
Less Shipments to members of steel industry for conversion into further finished products		
Net total	14.35	11.98

Manufacturers of finished cars and trucks adopted spectacular methods in trying to keep production of plants open when the supply of raw materials in the bins approached the vanishing point. Through the careful combing of all likely sources of the short material by the much-enlarged personnel of the purchasing departments a small supply of the wanted material would often be found in places far away from the factory. Frantic arrangements were made with the owner of the material to ship it by air express, even at costs greater than the price of the product itself. If the material was too bulky for air shipment, arrangements were made to send motor trucks loaded

with the precious material over distances ranging up to 600 or 1,000 mi., adopting "Pony Express" methods so as to move the goods overnight, and thereby keeping the plants operating when workers arrived at starting time the next morning.

In addition to valiant efforts at moving scarce materials from distant places in record time, considerable ingenuity was shown by manufacturers in using substitute material for missing items. When metal bumpers were not available to some companies at certain times, wooden bumpers would be attached to the vehicles so they could be shipped to dealers for delivery to waiting customers. Later, when metal bumpers became available, they would be fitted to the cars by the dealers. Such improvising added to the costs of manufacturing. When cotton fabric became limited in supply, one company turned to the use of the more expensive artificial leather for upholstering and inside trim. When cadmium was short for the treating of nuts and bolts, zinc was substituted at greater costs.

A better understanding of the headaches involved in producing such a complicated product as a motor car may be obtained from the fact that there are 6,000 to 8,000 parts in an automobile with 17,000 individual pieces, all of which have to be scheduled to arrive at the final assembly line at the proper time. Each manufacturer has thousands of suppliers to contact and nurse for a sufficient flow of the vital items. One manufacturer buys assemblies and finished parts from 1,850 separate manufacturers not counting raw materials such as steel, copper and lead.

The brightest picture in the automotive industry can be painted in the replacement parts field where production, as measured by sales in the United States, was more than twice as large as the prewar peak year of 1941. Due to the thousands of different types of replacement parts required to maintain the large number of automobiles, trucks and buses in use in the United States, there are no figures available showing the physical volume produced, nor are there figures on the aggregate dollar volume of production. However, it is possible to make an estimate on the dollar volume of factory sales to the United States market by dividing the federal excise tax rate on replacement parts into the dollar volume of excise tax collections. On this basis, the volume of sales in the United States by months are shown in Table IV.

Table IV.—Volume of Sales in the U.S., 1941 and 1946

	1941	1946

Oct.	24,875	...
Nov.	25,001	...
Dec.	22,267	...
Average	22,568	...

A comparison of Sept. 1946 with Jan. 1941 as shown in Tables V and VI shows that employment increased 36.7% while the increase in total dollar pay roll during the same period was 99.8%. Average weekly man-hours during the same period increased 42.2% and average hourly earnings gained 40.5%.

It should be borne in mind that production of motor vehicles decreased from 506,202 units in Jan. 1941 to 331,154 units in Sept. 1946. The large increase in production of replacement parts however tended to offset some of this discrepancy in trends of employment as compared with unit production of vehicles. The factory sales of replacement parts increased from \$51,337,000 in Jan. 1941 to \$145,877,000 in Sept. 1946, but for the year 1941 the dollar volume of replacement parts sold to the United States domestic market represented less than 20% of the value of motor vehicles produced and hence, can not fully explain the anomaly by the increase in employment by the increased replacement parts output.

The combination of strikes, shortages of materials, governmental regulations and increased hourly wage rates, along with lowered labour efficiency, increased costs of production to such an extent that during the period of price control by the Office of Price Administration prices on automobiles and trucks were increased several times to cover advances in costs. Despite the 43.3% increase in weighted average of passenger car prices by Nov. 1946 over the average in 1941, manufacturers of passenger cars showed a loss of \$135,000,000 in net profits before federal tax credits and a loss of \$5,500,000 after federal tax credits during the first nine months of 1946. The trend in net profits, or rather net losses, for the passenger car manufacturing industry was toward improvement as the year progressed. The net loss after tax credits in the first quarter was 10%, the first six months was three per cent, and the first nine months was one-fifth of 1%.

A comparison with net profits after taxes in previous years, for all companies manufacturing passenger cars, indicates that there was a general trend downwards in the percentage of net profit on sales after 1939, as follows:

1939	8.3%	1943	3.1%
1940	7.1%	1944	2.6%
1941	6.5%	1945	4.0%
1942	3.6%	1946 (1st 9 mos.)	1/5 of 1%

Figures were not available by the close of the year on net profits after taxes for all motor truck, bus and independent parts manufacturers for the first nine months of 1946, or for prior years. However, published reports of individual companies manufacturing parts, accessories or motor trucks indicated that those groups of companies as a whole might have made some profits during the first nine months, although there was no reliable basis for making any estimates on the amounts or percentage of net profits to sales.

During the first nine months of 1946 some companies manufacturing passenger cars suffered huge operating losses. One company lost \$74,422,630, another \$51,600,000, and a third company \$10,202,770. Such large deficits together with short-

ages in building materials and the allocation of building materials for veterans' housing program had the effect of discouraging and in some instances actually discontinuing plant expansion programs. Several plants well under way were abandoned because of these obstacles and the generally uncertain outlook.

Consumer Credit.—In prewar years the distribution and sale of the large volume of motor vehicles were greatly facilitated by the use of instalment credits to consumers of passenger cars and trucks. After the end of World War II the practice of selling cars on the instalment plan did not increase to the proportions obtained in prewar years, probably because of the accumulation of savings during the war years for the purchase of consumer durable goods.

The total amount of automobile and truck consumer credit outstanding at the end of each year from 1929 to 1945 and monthly data from Sept. 1945 to Oct. 1946, as published in the *Federal Reserve Bulletin*, are given in Table VII.

Registrations.—The total number of motor vehicles in use in the United States as reflected by the total registrations at the end of each year compiled by the Public Roads administration indicates a surprisingly large increase in rolling stock in 1946. In prewar years the industry estimated that the annual scrappage of motor vehicles generally averaged about 2,000,000 units a year. The number of units scrapped annually was computed by adding the new vehicles sold in the United States during the year to the total registrations at the end of the preceding year, and subtracting the total registrations at the end of the current year. This difference was assumed to represent the total number of vehicles scrapped during the preceding year. A variation of this method consisted of assuming that one-half of this difference was scrapped in the current year and the other half in the preceding year, for the reason that in about one-half of the state the laws permitted the owners to transfer the licence plate from the old vehicle scrapped, in collision, etc., to the new vehicle purchased. In such states there was no duplication in registration records, that is, a licence plate outstanding for the old vehicle scrapped as well as for the new vehicle purchased; whereas in other states, where such transfer of licence plates

from the old vehicle scrapped was not permitted, there would be two registration plates outstanding in the name of the one owner who scrapped an old vehicle and purchased a new one during the year.

If one followed this same procedure in computing the number of vehicles scrapped during 1945 and 1946, the results would indicate no passenger cars scrapped. In fact, the increase in total registrations can only be accounted for by the reregistration of old vehicles kept in storage during the war years. Some passenger cars must have been scrapped during 1945 and 1946, in collisions, fires, floods, or from old age and wearing out of vital parts, but there was no way of computing the total number of passenger cars scrapped. The motor vehicle commissioners in the states did not have any method for getting reports from owners on number of vehicles scrapped during the year.

A similar situation occurred in the truck data available. Total registrations at the end of 1945 and at the end of 1946 were greater than the total registrations at the end of the preceding years. However, the total number of civilian trucks sold in the United States was greater than the increases in the total registrations at the end of the year, compared with the preceding year, so that the figures did indicate some scrappage, although the actual scrappage probably was greater than the figures indicate, again, for the reason that some trucks were registered in 1945 and 1946 that were not registered during the war.

The registrations of passenger cars and trucks from 1941 to the end of 1946, with the latter year estimated by the U.S. Public Roads administration, are shown in Table IX.

Table IX.—Registration of Passenger Cars and Trucks

	As of Dec. 31st	Passenger Cars	Trucks	Total
1941	29,507,113	4,876,054	34,383,167	
1942	27,974,156	4,608,086	32,582,242	
1943	26,019,432	4,480,176	30,499,608	
1944	25,572,849	4,513,340	30,086,189	
1945	25,775,401	4,830,458	30,605,859	
1946	27,088,000	5,423,000	32,511,000	

It will be noted in Table IX that total registrations of passenger cars at the end of 1946 were more than 2,000,000 units less than the end of 1941, the largest prewar year. Motor truck registrations at the end of 1946 were more than 500,000 units greater than the peak prewar year.

Canadian Production.—Passenger car production in Canada during the first 11 months of 1946 totalled 83,331 and motor trucks, 71,571. Estimating for December, total passenger car production for the year 1946 would probably be 95,000 units and motor trucks, 80,000 units. (See also BUSINESS REVIEW.)

Automobile Insurance: see INSURANCE.

Automobile Racing. With the availability of gasoline for the first time in four years the auto racers put in a good year with the top event still the annual 500-mi. Memorial day classic at Indianapolis speedway. George Robson drove the winning car at an average speed of 114 m.p.h. which was just 3 m.p.h. under the existing record. Nine of the original 33 starters in the classic finished over a track which had been refurbished at a cost of \$250,000.

There were 175,000 spectators who saw Robson defeat Jimmy Jackson. The victor's time was 4 hr., 21 min. and 16.7 sec. He drove a 6-cylinder rear-drive Thorne Engineering Special weighing about 1,900 lb. and supercharged.

Jackson's time was 4 hr. 22 min. and .74 sec. with a 4-cylinder front-drive Boyle Special. Ted Horn was third in 4 hr., 35 min. and 28.65 sec. in a car that won the classic in 1939.

In September at the same speedway Rex Mays of Los Angeles won the American Automobile association championship, cov-

MIDGET RACING CAR overturning during the feature event at the opening of a new midget race track in Chicago's Soldier field in June 1946

ering the 100 mi. in 1:16:03.43 for an average speed of 79 m.p.h. Mauri Rose of South Bend finished second and Emil Andres of Chicago, third.

The 1946 National 100 mi. midget auto race championship was won by Ernie Gessel, of Hollis, L.I., at Cleveland. His time was 1 hr., 14 min. and 43 sec. He succeeded Tony Bettenhausen of Illinois as champion. The winning driver used a 100-h.p. speedster which weighed less than 950 lb., and averaged 75 m.p.h. Only 19 of the 30 starters finished. Al Bonnel of Erie, Pa., was second. Dan Brennan, Chicago, Ill., was third.

The death of Barney Oldfield removed from the scene a great pioneer in this sport. He died on Oct. 4 and was the first man ever to drive an automobile a mile-a-minute. (T. J. D.)

Aviation, Civil. In 1946, international operators lost no time in re-establishing commercial services and by fall the world's international routes exceeded 300,000 mi., more than twice the prewar mileage. Illustrating this growth were developments on the North Atlantic route, where the number of operators increased to ten companies representing eight nations and round-trip schedules rose to more than eight daily. At the same time, London-New York fares decreased from \$375 to \$325.

British international services expanded beyond their prewar scope and, with increased schedules, most of them became available to nonpriority passengers. The route mileage of British Overseas Airways corporation, totalling 56,615 in the spring of 1945, reached 72,000 at the close of 1946. To operate these routes, the corporation had a fleet of more than 220 planes. Among other new services, B.O.A.C. began commercial operations to North America and Hong Kong, and supplemented existing landplane service to Australia by joining with Qantas Empire Airways, an Australian government-controlled air line, in re-establishing the prewar flying boat route.

British European Airways, a new government-owned company, took over services to the continent, and extended its routes as far as Scandinavia, Czechoslovakia, Italy and Greece. Although established only in February, B.E.A. by October was operating some 9,793 route mi., and during the latter month flew 471,266 aircraft mi., 5,256,313 passenger mi., and carried

1,500,000 lb. of freight. Another new company, British South American Airways, started operations to Brazil and Argentina.

U.S. services also played a large part in the expanding international network. American Overseas Airlines, already reaching western Europe, extended operations to Stockholm and Berlin and began the first all-cargo flights across the Atlantic. Pan American Airways inaugurated Prague and Vienna service in Europe and resumed service to Manila and New Zealand in the Pacific area. Transcontinental & Western Air, Inc. entered the transatlantic field, offering service as far east as Saudi Arabia.

Passengers carried by U.S. international and territorial operators passed the 1,000,000 mark, rising from 492,792 to an estimated 1,040,000, while passenger mi. flown amounted to approximately 1,100,000,000, almost treble the 1945 figure. Although the total number of fatalities increased, passenger fatalities per 100,000,000 passenger miles flown dropped from 3.6 in 1945 to approximately 3.5 in 1946.

The U.S. Civil Aeronautics board completed authorizations for the postwar international routes outlined during World War II. Pan American was certificated to connect its Atlantic and Pacific routes, making possible the first one-carrier around-the-world service. A similar connecting service was made possible by joining the routes of T.W.A. and Northwest Airlines at Shanghai. Other route authorizations extended Pan American to South Africa and Braniff Airways to Argentina and Chile, and still additional routes were certificated to the West Indies, Mexico and Hawaii.

U.S. international carriers, however, had numerous problems. Operations over most of the newly authorized routes were yet to be initiated. Inauguration of service over some of these, together with the 1945 routes to Russia and parts of southeastern Europe, was prevented by refusal of the countries concerned to grant traffic and transit rights. The temporary grounding of all Lockheed Constellation aircraft by the civil aeronautics administration disrupted Atlantic services, and T.W.A.'s operations were suspended for a month by a pilot's strike, the first in U.S. aviation history.

Elsewhere in the world, Air France expanded its services to more than 50 countries, with routes to the U.S., South America, Africa and the far east. Royal Dutch Airlines rebuilt its prewar European network and began service to the U.S. The air lines of Denmark, Norway and Sweden began a joint operation to the U.S. as Scandinavian Airlines system. With routes blanketing Europe, Swedish and Danish air lines offered the only direct air service between western Europe and Poland. Making possible air service between Russia and the west was a Russo-Swedish service connecting at Finland. New companies, under Russian influence, appeared in eastern Europe; however, only one, a Czechoslovakian government-owned company, inaugurated services to western Europe.

In the western hemisphere, Trans-Canada's routes reached six U.S. cities, and its transatlantic operation, though still a government service, increased to one round-trip daily. South American national companies began extensive international operations, with F.A.M.A. (Flota Aero Mercante Argentinas), an Argentine company, and Panair do Brasil offering service to Europe, and a Venezuelan air line operating to the U.S. Australian National Airways, a private company, started service between Australia and Canada on behalf of a new government-controlled air line. On the Asiatic continent, China National Airways resumed operations between China and the Philippines.

Throughout the world, internal services likewise reacted to peacetime conditions. In Great Britain, with the removal of wartime restrictions, the government announced a program for increasing the air network from London, for new east-west routes and for supplemental seasonal services. Canadian serv-

	(Eight months ending Aug. 31)			
	Passengers carried	Passenger mi. flown	Goods (ton mi.)	Mail (ton mi.)
1945	252,189	89,843,220	972,133	1,263,915
1946	409,480	131,375,688	1,457,821	982,012

Source: Dominion Bureau of Statistics; Air Transport Board.

*Includes non-scheduled carriers and international services of scheduled operators with the exception of Trans-Canada's Atlantic operations.

The scope of operations over the expanding Australian air system, long a vital factor in the development of the continent, was clearly indicated by the announcement that Australian National, one of the major companies in Australia and an outstanding passenger carrier among the air lines of the British commonwealth, for the year ending June 30, 1946, flew 15,000,000 mi. and carried 394,000 passengers.

U.S. domestic services remained the most extensive in the world. Swelled by new aircraft and surplus military transports, the domestic fleet increased to approximately 655 planes as compared with some 411 at the beginning of the year. As a result, schedules increased generally and faster, nonstop flights appeared. Approximately 50 daily round trips were offered between such major cities as New York and Boston and transcontinental flights making only a fuel stop en route became available.

For the first time major efforts began to be devoted to air freight. Reduced rates and simplified rate structures were established. American Airlines formed a cargo division to handle freight on a contract carrier basis and American and United Air Lines placed in use specially equipped all-cargo planes.

Traffic carried by the domestic air lines continued its upward trend. The total number of passengers for the year was estimated at 12,779,000, almost double the 1945 figure, and passenger mi. for 1946, showing a comparable increase, approximated 6,158,000,000.

†Percent of seats occupied.

Accompanying these increases were corresponding rises in passenger revenues. Higher costs, however, reduced the average net operating revenue to only slightly above the profit level, and many of the carriers showed substantial losses for the first time in several years.

Table III.—Selected Revenue Statistics for U.S. Domestic Scheduled Air Carriers*

	(Nine months ending Sept. 30)

Increases in miles flown more than offset the greater number of fatalities, with a resulting improvement in the safety record. Passengers killed per 100,000,000 passenger miles decreased from 2.1 to approximately 1.2.

The number of cities certificated for scheduled service rose to 580 as compared with 406 in 1945. A major addition to the

domestic system came with CAB authorization of nine new regional carriers to operate feeder services on a three-year experimental basis. These new routes totalled more than 10,000 mi. and afforded to numerous communities their first scheduled air transportation. Inadequate airports, however, temporarily prevented service to many of these points.

Nonscheduled and Miscellaneous Services.—Nonscheduled operators continued their amazing development and in the U.S. became an important factor in the aviation picture. Led by veterans trained in aviation and having priorities to purchase surplus aircraft, hundreds of companies sprang up over night. With equipment ranging from single-engine planes to four-engine aircraft, these operators gave a variety of services, domestic and international. The scope of their operations was demonstrated by the fact that for several months one large nonscheduled operator flew freight ton miles far exceeding those of its nearest rival among the scheduled air lines.

Although extensive passenger service was offered, primary emphasis was on freight, with many items never before extensively shipped by air, moving in volume. Some shipments were undoubtedly for publicity, but many resulted from the economies achieved by such factors as speed and ease of handling. Despite these successful operations, the future of the nonscheduled operator was still in doubt, with much depending on the nature of the regulations applied to them by the CAB.

Nationalization of scheduled services in England left only charter and nonscheduled operations open to private companies. Although there, too, the field legally open to these enterprises was uncertain, new charter companies were established and charter operations expanded with such undertakings as luxury passenger service between England and Switzerland.

Private Flying.—In the U.S., government financial assistance to veterans taking aviation training, the return to civilian life of thousands of war-trained pilots, the appearance of new personal planes in quantity and the availability of gasoline for nonessential uses created a boom in pleasure flying. Student pilot certificates issued during the year numbered approximately 170,000, as compared with 77,188 in 1945, and pilot certificates outstanding, excluding student permits, rose from 296,895 to an estimated 400,000. Certificated aircraft increased from 37,789 to approximately 85,000. Lack of airports, one of the greatest deterrents to private flying, was being overcome by the government's airport aid program.

In the other English-speaking countries, although wartime restrictions were lifted, numerous impediments to pleasure flying remained. Many British aero clubs resumed activities, but failure of the government to restore subsidies to the clubs, shortages of gasoline and equipment, and the high cost of the equipment obtainable, kept pleasure flying on a restricted basis. Nevertheless, pilot certificates outstanding, while still below the prewar level, increased by fall to approximately 4,060, exceeding the 1945 total by some 2,500; and the number of registered civil aircraft grew from 976 to 1562. A similar situation prevailed in Canada, though adequate gasoline supplies afforded some relief. Australia alone resumed full-scale government subsidies to its aero clubs.

As potential purchasers of light planes, farmers assumed a dominant position. In the U.S. it was estimated that in proportion to the numbers of farm and urban dwellers, one-third more farmers than city residents were buying personal planes. Farmers with large acreage were using their own planes to detect soil erosion, check fences and irrigation ditches, locate lost livestock and round up cattle.

The use of company-owned planes, long employed by Canadian mining companies to transport employees and equipment to isolated mines, was growing elsewhere, particularly in the U.S. Many companies purchased surplus planes; others bought new "executive" type aircraft.

Government.—International co-operation in civil aviation reached a new peak with the first meeting of the Assembly of the Provisional International Civil Aviation Organization (P.I.C.A.O.). Particularly noteworthy among P.I.C.A.O. activities were a series of conferences held to make recommendations on air navigation facilities and standards for international services. By the end of the year 14 nations had ratified or adhered to the convention of the Chicago conference of 1944 providing for a permanent organization to succeed P.I.C.A.O., and it appeared likely that in 1947 the 26 adherences or ratifications necessary to bring the permanent organization into existence would be deposited.

Limited acceptance of the "Five Freedoms" agreement of the Chicago conference, designed to establish freedom of the air on a multilateral basis, accelerated the negotiation of bilateral agreements prescribing international air traffic rights. Among the most important of these was the Bermuda agreement between Britain and the U.S., which, to a great extent, established free competition between the international services of the two countries. Both nations subsequently announced that the principles of the Bermuda agreement would be applied in their negotiations with other countries.

Although not a government organization, the International Air Transport association, comprised of the international air lines of the world,

THE DOUGLAS DC-6 COMMERCIAL TRANSPORT, first flown late in 1946, carries 52 to 58 passengers as a day plane or 26 passengers in sleeping accommodations. Its cruising speed is more than 300 m.p.h. It is 100 ft. 7 in. long and has a wing span of 117 ft. 6 in.

was an important medium in effecting international co-operation. Important I.A.T.A. activities included the fixing of international fares, establishment of an international clearing house for intercompany accounts, and standardization of many air line practices.

Much attention of P.I.C.A.O., I.A.T.A., and numerous other groups was devoted to facilitating international travel through simplification of governmental travel requirements. The U.S. adopted P.I.C.A.O. proposals for speeding customs, public health and immigration clearance. Great Britain and France agreed to abolish visas in travel between those countries, and a few American countries permitted visits up to six months without passports or visas.

U.S. government policy continued to be one of regulating privately-owned and -operated companies. The CAB, in addition to its activities in fixing rates and authorizing routes, devoted much attention to formulating a regulatory policy for nonscheduled operators. After applying to such companies safety standards similar to those governing scheduled lines, the CAB had under consideration proposed economic regulations for the nonscheduled operators. The CAA established foreign offices to discharge its safety functions on the expanding routes of U.S. carriers, and undertook to operate temporarily for the use of civil aviation, essential air navigation facilities constructed by the U.S. armed forces in foreign countries.

A new Air Co-ordinating committee comprised of representatives of interested government departments was given broad responsibilities, including co-ordination of governmental aviation activities and the advising of the president on matters of aviation policy. Congress authorized a reduction in the postage rate on domestic and territorial air mail from eight to five cents, effective Oct. 1. An immediate result was a 40% increase in domestic air mail.

Direct participation in air line operation remained the focal point of governmental activity in the British commonwealth. In England, the bill to nationalize scheduled air services became law. Three government-owned corporations were designated to furnish all scheduled services: British European Airways for internal and European services; British South American Airways for Latin-American operations; and British Overseas Airways for all other routes.

The Australian government entered the domestic transport field in competition with private companies when the government-owned Trans-Australian Airlines began operations. Canada's plans to eliminate surface carrier ownership of air lines, aimed at the Canadian Pacific Railway's aviation activities, were abandoned. The government-controlled Trans-Canada Air Lines, however, retained its designation as operator of all internal trunk lines and international services. The South Pacific Air conference of Australia, England and New Zealand agreed upon the formation of British Commonwealth Pacific Airlines, jointly owned by the three countries, to operate services from Australia and New Zealand to North America. The conference recommended a permanent South Pacific Air Transport council to advise the governments regarding Pacific services.

Technical Developments.—With piloted aircraft having reached 615.7 m.p.h. and guided missiles having exceeded the speed of sound (roughly 750 m.p.h. at sea level), much research was directed to achieving piloted flight at supersonic speeds. A major part of this effort was devoted to solving the problems of flight through the transonic region of speeds immediately above and below that of sound, where forces not encountered at subsonic or supersonic speeds disrupt the controllability of aircraft of conventional design.

Unable to procure accurate wind tunnel observations of the phenomena occurring at speeds between approximately 97% and 120% of the speed of sound, research turned for such data to models mounted in the high-speed flow section of the wings of aircraft, free falling bodies and rockets launched from the ground. Experimental aircraft designed to withstand the forces of transonic flight and to operate at supersonic speeds were developed in both England and the U.S. Although construc-

tion of the British aircraft, the Miles 52, was abandoned, the Bell XS-1, the first rocket-propelled aircraft, safely passed piloted tests under power. Speed on the initial flight, however, was not permitted to exceed 550 m.p.h.

Research on wing designs, giving major emphasis to supersonic flight, continued with experiments on thinner wing sections and sweptback wings. Radical examples of sweepback were to be found in the Bell L-39 and the De Havilland ro8. Success of research on the design which incorporates all functions of the fuselage and empennage in the wing was demonstrated in the U.S. by the Northrup XB-35, Flying Wing bomber. Similar research in England produced the Armstrong-Whitworth 52-G, a glider model of a proposed tailless transport aircraft.

Development of power plants, particularly of jet engines, also focused on high-speed flight. Although jet engines powered numerous military models, no jet-propelled civilian planes were in use. However, auxiliary jet power was applied commercially with the installation on some U.S. air line transports of a rocket attachment for assisting in take offs, and several transports in production were to utilize jet exhaust for additional power. The commercial possibilities of jet propulsion were exhibited when an experimental British Lancastrian having two reciprocating and two jet engines, reportedly flew 100 m.p.h. faster using jets alone than the standard Lancastrian with four reciprocating engines. This plane made numerous successful flights, on one transporting a group of distinguished passengers from London to Paris.

Reaching the practical stage and slated to be on future transport aircraft were turbo-prop engines, in which gas turbines operate regular propellers. That advances in new-type power units, however, did not eliminate work on reciprocating engines was shown by the development of the Lycoming 5,000 h.p., 36-cylinder engine in the U.S., and the Arsenal 24H, 4,000 h.p., 24-cylinder engine in France.

New National Advisory Committee for Aeronautics propeller designs in the U.S. increased efficiencies to 90-95% through a speed range up to 500 m.p.h. Other experiments produced a propeller with sweptback blades for high speeds. As part of a program to reduce propeller noise, experiments were underway on lightplane propellers having eight short blades, diminishing noise by reducing the speed of the blade tips.

Production and New Equipment.—Civilian planes again began to be produced in substantial numbers. In the U.S. this production for 1946 was estimated at 35,000 planes having a value of \$170,104,000 as compared with 2,057 planes of an approximate value of \$14,828,000 in 1945. Personal planes (five place or under) comprised an estimated 34,560 of the total 1946 civilian production, while transports accounted for the rest.

Among the British planes placed in use were the 24-passenger, 2-engine Vickers Viking, cruising at 171-263 m.p.h. and the Bristol Wayfarer, a twin-engine, utilitarian plane with a cruising speed of 140-180 m.p.h., designed for 32 passengers or all cargo. Also ready for service was the 8-11 passenger De Havilland Dove for feeder line use. The initial Avro Tudor I, first British plane incorporating cabin pressurization for altitude flying, was delivered to B.O.A.C., and the 40-60 passenger Tudor II was undergoing flight tests. Completion of the largest proposed British transports, however, was distant. Canadian transport production concentrated on DC-4's with liquid-cooled Rolls Royce Merlins replacing the usual air-cooled engines. In Australia, military types continued to be stressed to the exclusion of civilian planes.

The first U.S. postwar transport type delivered was the four-engine Douglas DC-6. Carrying 52-58 passengers plus 5,000 lb. of cargo at some 300 m.p.h., the DC-6 was the first commercial aircraft having reversible pitch propellers as landing brakes and N.A.C.A. thermal de-icing, utilizing hot gases conveyed through critical areas. The Martin 202, a twin-engine aircraft for 36-40 passengers or cargo, underwent flight tests. Nearing completion was the 80-114 passenger Boeing Stratocruiser, designed to cruise at approximately 315 m.p.h. Although the 400 m.p.h. Republic Rainbow, fastest U.S. transport aircraft, had been tested in an army version, delivery date was uncertain at the end of the year.

In the U.S. many new personal plane models appeared. Extremely popular was the two-place Ercoupe, a spin-proof, all-metal plane having

tricycle landing gear. The four-passenger amphibian Republic Seabee, powered by a single pusher engine, combined outstanding performance with low cost. The single-engine Stinson Voyager and North American Navion, cruising at 125 and 150 m.p.h., respectively, over ranges of 500 and 700 mi., placed emphasis on utility. Unusual designs included the Beech Bonanza and the Waco Aristocrat. In the former, a single V-shaped or butterfly empennage replaced the customary vertical and horizontal tail surfaces. In the latter, the propeller was located aft of the tail.

British lightplanes included the Miles Gemini, a four-place, twin-engine monoplane cruising at approximately 140 m.p.h. Lighter planes were the two-place, 75 h.p. Auster Arrow and the similar three-place Auster Autocrat. The Percival Proctor V, a modern version of a wartime plane, carried four passengers at 140 m.p.h. over a 500 mi. range. Among the Canadian planes was the De Havilland Chipmunk, a two-place all-metal monoplane of purely domestic design.

Rotary Wing Aircraft.—CAA certification of several models for civilian use paved the way for commercial application of the helicopter in the U.S. The practical value of these craft was again demonstrated when the U.S. post office department successfully used helicopters in experimental mail services in several metropolitan areas. Under experimentation were conventional helicopters with one main rotor and small tail rotor, and other designs having two main rotors arranged coaxially, intermeshed, outboard, or tandem, with power supplied by one or two engines. In Britain, the Cierva W-9 utilized jet to counteract the torque of the rotor, and in the U.S. the Kellett and MacDonald companies announced development of ten-passenger helicopters.

Aids to Navigation.—Wartime technical advances, the need for all-weather flying in commercial aviation, and increased international operations brought about widespread activity in developing aids to navigation. Major emphasis centered on instrument landing systems. SCS-51, an outgrowth of the prewar CAA system, improved and used extensively by the armed forces, seemed likely to achieve almost universal civilian use in the immediate postwar era. In the U.S., SCS-51 was installed at approximately 50 airports and on commercial air lines. This system was also adopted by the Radio Technical division of P.I.C.A.O. for use by international trunk lines. Automatic blind landing on the SCS-51 system became possible with the development of an automatic approach control device as an accessory to the gyropilot.

Very high frequency radio transmission, largely static free, was coming into general use and in the U.S. began replacing medium frequency transmission on radio ranges. Plans also called for replacement of existing fixed, four-course ranges with V.H.F. omni-directional ranges, affording courses in all directions.

The great wartime developments of radar held promise of solving many long-standing navigational problems. Although most radar equipment required further refinements for widespread commercial application, Ground Controlled Approach appeared suitable for immediate civilian use. Employed extensively by the military for instrument landings, G.C.A. was being adopted as a traffic monitoring device for checking plane movements in the vicinity of airports. Other wartime devices used commercially during the year were the British Gee short-range and the U.S. Loran long-range navigation systems. Major radar research projects for the year were devoted to developing distance indicators and collision prevention devices. Research, however, covered a wide range, and such devices as Teleran, combining air-borne radar and television were announced.

Records and Events.—The return to peace was marked by resumption of air races and exhibitions, and in most countries an eager public had its first close view of many hitherto secret developments and of new aircraft and equipment. Also evidencing peace were widespread attempts to break existing records. The U.S. army made record attempts in a majority of the official landplane categories, but most of the results were still pending homologation by the Federation Aeronautique Internationale at the end of the year. Some interesting new records established in various countries were, however, recognized as official. Outstanding were the 615.7 m.p.h. speed record set by Group Captain E. M. Donaldson in England with the jet-propelled Gloster Meteor, and the 11,235.6 mi. world distance record established by a U.S. navy crew with a Lockheed P2V in a flight from Australia to Ohio. An international helicopter record resulted from a 705.3 mi. U.S. army helicopter flight from Ohio to Boston. (See also AIRPORTS AND FLYING FIELDS; AVIATION, MILITARY; PETROLEUM; POST OFFICE.) (G. M. M.)

Aviation, Military. **U.S. Army.**—In 1946 the United States army air forces was reorganized to meet its peacetime mission of providing an instantly ready means of national security. Under the overall command of Gen. Carl Spaatz, the air forces was divided into eight major commands: the strategic, the tactical, the air defense, the proving ground, the air matériel, the air transport, the training commands and the air university.

Combined with this administrative change the air forces continued its replacement of

wartime personnel with volunteers for its regular establishment. The strength of the air forces on Jan. 1, 1946, was almost 900,000. By the end of the year this strength had been reduced to less than a planned 400,000.

In a continuing effort to free itself from the costly burden of obsolescent aircraft the air forces declared surplus for disposal by civilian agencies many thousands of its aircraft, so that by the end of 1946, it had on hand little more than one-third the number of planes that it had at one time during World War II.

While the numbers of new planes delivered to the air forces during 1946 was comparatively low, every possible effort was made to ensure that the planes delivered were the best that aeronautical science could produce. As a result the models of the P-80 jet fighter were constantly improved; a new jet fighter, the P-84, was delivered in usable quantities, and two new bomber types and one nontactical research aeroplane made their first flights. The B-35, a flying wing very heavy bomber, and the B-36, an ultra long-range, very heavy conventional bomber began undergoing an exhaustive series of flight tests. The B-36 seemed capable of carrying 10,000 lb. of bombs for at least 10,000 mi., or of carrying a somewhat lighter load from one point to any other on the earth. The research plane was the XS-1, a rocket-propelled airframe built to withstand large stresses and great speed. It was hoped that the XS-1 might eventually exceed the speed of sound, a velocity which no other piloted aircraft had yet reached successfully in level flight.

In testing the tactical possibilities of its aircraft, the air forces were responsible for several noteworthy flights. One resulted in a new transcontinental speed record, when a P-80 flew nonstop from Los Angeles to New York city in 4 hr. 13 min. and 26 sec. Later in the year, a modified B-29 bomber flew nonstop from Hawaii to Cairo, Egypt, via the north polar regions to prove the feasibility of using the great circle routes across the top of the earth. A national speed record of 611 m.p.h. was set by a P-84 fighter in California. Finally, in a flight presaging an era of pilotless aircraft, two radio-controlled B-17s made a successful trip from Hawaii to California, having been taken off, flown and landed with no crew or passengers aboard. (C. Sz.)

U.S. Navy.—As with the entire naval organization of the United States, naval aviation within the U.S. navy was faced in 1946 with reconversion to a peacetime basis. The size and scope to which this air component of a modern sea power had grown during World War II meant that its reconversion involved not only planes, but personnel, bases and ships. The accompanying table gives a comparison in the size of these elements in the U.S. navy as they were at the end of World War II and in the latter months of 1946.

Naval aviation continued to play an important part in the peacetime operations of the U.S. navy during 1946. A number

		1946	
		In Operation:	Reserve organization, replacement pools and storage to augment new production

(†This figure includes the U.S.S. "Coral Sea" and the U.S.S. "Oriskany," which were being built.)			

A NORTHROP FLYING WING B-35 BOMBER, built for the U.S. army air forces, and representing a new family of aeroplanes in which engines, crew, fuel and bombs are carried in the wing itself, and the drag-producing fuselage and tail surfaces are omitted. This makes possible greater loads, longer range and higher speed than is possible with conventional aircraft. The first giant Northrop Flying Wing, which has four 3,000 h.p. engines, a span of 172 ft., length of 53 ft. 1 in. and a gross overload weight of 209,000 lb., flew in June 1946

of carriers were in use early in the year expediting the return of troops to the U.S. for demobilization. In March, a task group headed by the U.S.S. "Midway," one of the U.S. navy's new 45,000-ton aircraft carriers, conducted experimental operations in the frigid waters of the North Atlantic. Planes flying from carriers conducted vital photographic and reconnaissance missions during the atom bomb tests at Bikini atoll in the Pacific during July. One of the U.S. navy's new P2V Lockheed Neptune patrol planes, the "Truculent Turtle," set a new world's long-distance flight record when it took off from Perth, Australia, on Sept. 29 and landed at Columbus, O., 55 hr. and 17 min. later after a flight of 11,236 mi. Navy planes were slated to have an important part in the activities of Operation High Jump, which got under way when a naval task force sailed from the east and west coasts in December for the Antarctic. During the year, planes of the naval air transport service operated over routes totalling 45,000 mi. to the Philippine Islands, China, Japan, Alaska, the Aleutians, Newfoundland, Central and South America, throughout the Caribbean area and all over the United States. The naval air reserve program initiated in July at 21 air stations throughout the United States provided continuous training with up-to-date planes and equipment for civilians who, during World War II, served as officers and enlisted men in naval aviation.

While intensive research and development in all fields of aviation were being continued by the U.S. navy, new planes embodying improvements gained from experience in operations during the war were announced during 1946. Three new jet fighters appeared as successors to the FR-1 Ryan Fireball, the U.S. navy's first plane to employ jet propulsion. The FD-1 McDonnell Phantom was their first all-jet plane. Two other all-jet fighters, the North American XFJ-1 and the Chance Vought XF6U-1, were flown for the first time in November. The speed and combat range of these new jet fighters put them on

a par with the newest land-based jet fighters.

Two carrier-based planes of the new "attack" type were also announced. They were the AM-1 Martin Mauler and the A2D-1 Douglas Skyraider. This new type of single-seat plane combines the functions of the torpedo and dive bombers. New U.S. navy patrol planes were the P2V Lockheed Neptune and the Martin XP4M-1. The latter plane is powered by both jet and reciprocating engines. The Lockheed R60 Constitution, the navy's largest plane, has a capacity for 168 passengers as a transport and a useful load of 69,000 lb. as a cargo plane. Other new planes were the XJL-1, an amphibious utility plane; the XOSE-1, a single-seat scout observation plane, and the XNQ-1, a greatly improved primary trainer. (See also NAVIES OF THE WORLD.)

(A. W. Rd.)

Airforces—The World.—Between V-J day and the end of 1945 the victorious air forces of Great Britain, the U.S.S.R. and the United States had little time for anything but the consolidation of their tactical positions, the policing of occupied territories and the reduction of the flow of production-line aircraft from the manufacturing industries at home. There were more new aircraft in the pipe lines and in storage depots than they could possibly use in many years of normal peacetime activity. Contract cancellations, the demobilization of over-inflated industry and the disposition of thousands of surplus aircraft were the problems of the balance of that year.

The last was particularly important. Technological developments that were in sight at war's end made it evident that, except for a limited number of aircraft that might be salvaged for training and police work, every fighter and every bomber that rolled out of factory doors by the end of 1945 was as obsolete for future tactical requirements as the dodo. Two developments made that point clear, both of which had had their genesis (and a considerable reduction to practicability) in Germany before V-E day:

- (1) The guided missile, or controlled, pilotless bomb.
- (2) The jet engine that opened the door to flying speeds far beyond those possible with conventional engines and propellers.*

During 1946, the whole future course of aeronautical re-

*(For an excellent résumé of current status of jet and rocket power plants in the U.S. and elsewhere, see *Fortune*, Sept. 1946, pp. 128-140 et seq.)

search and aerial tactics was changed by these two items. Scientists and strategists alike started off on new paths whose end was still too far over the horizon to foresee.

The widely publicized advances in atomic research had no practical influence on the course of airplane design in any country in 1946. It was known that projects were afoot to adapt some form of atomic energy power plant for eventual aircraft use. Obviously it would be highly desirable to dispense with the normal fuels and engines, and fly for almost indefinite periods on energy released by atomic fission. But the practical difficulties are many. For one, the only known means of protecting personnel from the lethal effects of the several forms of radiation that accompany atomic disintegration is to surround the energy source with thick walls of lead. Possibly, when the nature of such radiation is more thoroughly understood, some lighter protective coating may be developed, but a few simple calculations will show that the weight of the lead that would be required to protect flight crews and passengers from radiant energy, or from the poisonous end-products of atomic fission, would anchor any known form of aircraft quite securely to the ground.

It would be dangerous to predict that aircraft of the future will not be atomic-powered. For the present, however, the practical military application of atom-splitting remains in the field of the weapon and not the carrier.

Guided Missiles.—Guided missiles carrying loads many times more lethal than those used against Japan or at Bikini may be launched from hidden, well-protected bases hundreds of miles from aiming points. They may drop without warning on their targets at supersonic speeds. Against such attacks, once launched, there is no real defense, save by burrowing deep into the earth.

Every country in the world that had any pretense of a military establishment had "guided missile" projects tucked away in its "Top Secret" files. Little leaked out of Britain's plans and programs, but it was a safe guess that from the earliest days of the V-2s, its technicians were hard at work on similar projects.

Persistent rumours of mysterious projectiles with fiery tails streaking across Swedish skies led easily to a suspicion that the U.S.S.R. was in the running.

More than a hint of what was going on in the United States reached the public prints late in 1946. "Stills" and newsreels of army launchings of captured German V-2s, and the "WAC Corporals" and "GAPAs" were released. The navy, not to be outdone, disclosed some of its own pet projects, from "Tiny Tim," an air-borne 500-lb. rocket, to its larger glide bombs and its controlled missiles. The National Advisory Committee for Aeronautics showed some of its rocket research in action at an isolated test station off the Virginia coast.

In looking back over 1946, however, one thing can be assumed as certain. Any items that were disclosed to the public were long since considered obsolete by the services. The really important guided-missile projects everywhere were still strictly under wraps. That aerial warfare of the future would be radically different from what it was in 1946 was also a certainty.

Piloted Aircraft.—Most of the types used in 1945 were in service in 1946 in the surviving air forces of the world. Many of them were improved during 1946, but, at best, the gains were marginal: a little more power from slightly better engines and propellers; a little more speed from better streamlining and improved detailing; a little more range from better fuels and slightly bettered overall efficiency; noticeably better performance at high altitudes from more efficient superchargers; better pilot protection, in the form of pressurized cabins and protective clothing.

Exclude the jets and the rocket-powered projects, and the

conventional types of 1946 were but relatively little better than their prototypes of several years before. Even the most advanced service machines of 1946 (for example, the R.A.F.'s Tempest and latest Spitfire, its big Lancasters and Hastings, the U.S.'s Thunderbolts, Mustangs, Black Widows and Hellcats and big bombers, up to and including the Superforts and the XB-36) were in design stages and in production before the end of World War II. Many of them were already being classed in "trainer" categories, as intermediate steps toward super-performance, jet-powered machines. One must look, therefore, to the experimental types of 1946 to indicate the trends. In this transition stage, they were the significant items. In the paragraphs below, a brief survey will be made of those aircraft which point the way toward the future.

The Axis Powers.—For the conquered countries there was not much to review. The aviation industries and the air forces of Germany, Italy, Japan and their satellites had been destroyed and disbanded in 1945. The bones of Hitler's great war industries were picked clean of technical "meat" by hordes of soviet, British and U.S. experts who swarmed into the country before the dust of battle had settled. Thousands of tons of documents, drawings, specifications and patents were removed to centres in the U.S.S.R., Great Britain and the U.S.

For 1946, such documents were combed over piece by piece and all valuable information extracted. A large number of former nazi scientists and aeronautical engineers were brought out of Germany to help analyze and clarify the captured materials. Through the army's Air Document centre at Wright field (Dayton, O.), these data were being made available to U.S. aircraft constructors.

The "pickings" in Japan were scarcely worthwhile, technologically speaking. Its air effort had been not inconsiderable from a production standpoint. In spite of much newspaper propaganda to the contrary, the planes it produced (up to the time the blockade cut seriously into its supplies of necessary materials) were of modern design and good construction and put up a high average in performance. Unlike the Germans, however, the Japs produced no novelties in design and made few contributions to technical knowledge. One or two special types were built to fit into the tactical concept of Kamikaze, but they embodied no features that were unknown elsewhere in the world. What technical documents remained, together with samples of every type of aircraft and engine that were available, were brought back to the U.S. for analysis and study by U.S. military and naval experts, but it was doubtful if much of value would drop out of the examination. Certainly nothing happened in Japan during 1946 that had any significance for the future of aviation.

Revival of French Aviation.—France was in a different category. During the occupation, the Germans either stripped French aircraft factories of materials and tools or converted them to the production of aircraft of German designs. In spite of such handicaps the liberated French industry showed unmistakable signs of revival by mid-1946. For the first time after 1938, the biannual Salon de l'Aeronautique was held in the restored Grand Palais in Paris with many new aircraft on display. Although the "solid" part of the show was predominantly British (England showed more actual production types than "futures"), the French exhibits indicated a considerable degree of advanced thinking. Most of their machines were only in prototype or "mock-up" stages.

The postwar French aircraft industry emerged in substantially its pre-occupation form. During the late 1930s, in common with the other munitions-making industries, it was nationalized, for better or for worse (and, as it turned out, for worse). The famous company names of France's aviation hey-day, Bleriot, Farman, Hanriot, Latécoère and the rest, were absorbed in four great government-owned and controlled corporations, generally abbreviated as S.N.C.A. (Société Nationale de Constructions Aéronautiques) du Nord, S.N.C.A. du Centre, S.N.C.A. du Sud-Est and S.N.C.A. du Sud-Ouest. Again, for better or for worse, the pattern for the future was the same as it was in the late 1930s.

Most of the French effort appeared to be concerned with light aircraft "pour le sport" and with conventional types of medium-to-large transports. The first of the postwar, all-French four-engined transport, the Languedoc 161, went into service for Air France in the summer. The largest exhibit in the show was a 40-ton, 150-passenger, 4-engine Aero-centre NC211. Others ranged downward to 4- to 6-passenger air taxis. None showed much in the way of structural or aerodynamic novelty.

Of possible future military significance, a few French helicopters appeared. The largest was a five-place twin rotor machine built by S.N.C.A. du Centre. Like the U.S. Kellett KR-10, its two rotors are mounted on top of the fuselage and are interesting. Berguet has a small 2-rotor, co-axial helicopter driven by a 240 h.p. engine. A high speed of 149 m.p.h. was claimed. The S.N.C.A. du Sud-Est also had a twin-rotor machine for four passengers and a pilot, patterned after the German Focke-Wulf designs. Most novel was the South-West's small helicopter with jet driven blades for lift and an orthodox pusher propeller for forward motion. Little was known of its flight capabilities.

That French designers were thinking in terms of jet propulsion and supersonic flight was evident. Both the German Walter type rocket engine and the Junkers Jumo 004 jet engines were designed into French aircraft. At least one all-French turbo-jet unit was tested, the S.N.C.A.-N.E. Rateau GT S-65. It was said to be similar to the early British Whittle types, except that it incorporates an axial-flow air compressor.

A number of jet-driven aircraft were designed and some were constructed, but little was known of their performance or whether they had been flown at all. The S.N.C.A.-S.O. 6,000 was said to have been in the air with a Jumo 004 jet engine, but it was being redesigned to take the British Rolls-Royce Derwent (and later the R-R Nene) engines. It was primarily a trainer and research aircraft. It is a small, all-metal two-

Above: THE LOCKHEED CONSTITUTION, the U.S. navy's largest aircraft, was shown to the public on Aug. 21, 1946, after three years of development and construction under strict secrecy. The 92-ton double deck transport had a wing span of 189 ft., an over-all length of 156 ft. and contained every known flying aid, including the most complete radar equipment ever carried in a plane

Below: THE "PHANTOM" XFD-1, new jet-propelled carrier fighter plane of the U.S. navy, as it rested on the aircraft carrier "Franklin D. Roosevelt" prior to its flight tests on July 21, 1946

Above: THE MOST POWERFUL FIGHTING PLANE in the world, the XP-81 of the U.S. army air forces, was announced early in 1946. It was the first plane to fly with a gas-turbine engine designed for propeller drive. The gas-turbine and independent jet-propulsion engine in the tail give it a speed of more than 500 m.p.h.

Below: "TRUCULENT TURTLE," a U.S. navy two-engined patrol bomber, arriving at Columbus, Ohio, on Oct. 1, 1946. The plane completed a long distance flight of 11,236 mi. from Perth, Australia, in 55 hr. 15 min., a new world's record

seater. Maximum speed was said to be in the 500 m.p.h. range. With the larger engine it was expected to fly at 590 m.p.h. In its current form it had no military significance.

The prototype VG 70-01, built by the Arsenal de l'Aeronautique, although not flown in 1946, had interesting possibilities. It is a highly swept back monoplane with a span of about 30 ft., single place, built around the Junkers Jumo 004 engine. Air intake for the engine is through a large scoop along the belly of the fuselage, rather than at the nose as in the U.S.'s P-80's. Its surfaces were polished glass-smooth. More than 600 m.p.h. was expected.

For trans-sonic research, S.N.C.A.-S.O. built the M-1 around the German Walter rocket motor. It had apparently been flown only as a glider or as a towed aircraft for research purposes. It has highly swept back wings, and, like the last of the German Rocket plane designs, has no undercarriage, simply a skid on which to land.

Another project of a similar nature was the NC 271 by S.N.C.A. du Centre. It had been tested only in a wind tunnel in 1946, and possibly as a glider. It was to be powered eventually with two rocket power units, one on each side of the fuselage, in the wing root. A model of another twin-jet design was also shown, the SE 2400. It is laid out for two British Rolls-Royce Nene jet turbo units mounted one above the other inside its relatively deep fuselage. Wings are narrow and are sharply swept back.

U.S.S.R.—Unfortunately, very little was known of military aviation progress in the U.S.S.R. It was assumed (from certain phenomena allegedly seen over Sweden) that some research was in progress on guided missiles. It was probable, also, that captured German jet and rocket engines were studied and reproduced. Unconfirmed press reports hinted at sales of certain British turbo-jet units to the U.S.S.R. No information was at hand to indicate what success, if any, had been achieved with soviet-designed jet-turbine units.

A report from a British source stated that one of the standard TB-7 long-range 4-engine bombers (normally powered with 1,350 h.p. liquid-cooled AM-35 engines) had been flown with 4 reaction propulsion units. It was not indicated whether the jet units were of soviet or of German origin.

Another version of the wartime TB-7 was known as the PE-8. In this machine, radial, air-cooled engines appeared to have been substituted for the AM-35s.

In the single-engine fighter categories, the older YAK-7s and the LAGG-7s (somewhat similar to the German Me-109s and FW-190s) appeared to have been supplemented by the later LA-5, single-engine, single-seat interceptor fighter. The type was known to have been in production during the latter stages of World War II but was evidently subject to some continuous improvement. It is of orthodox pattern with circular fuselage, closely cowled 14-cylinder radial engine (M-82 of 1,600 h.p.) and large spinner. Armament consists of two 20-mm. guns in the fuselage. All-up weight was reported at 7,400 lb., top speed 370 m.p.h. at 16,000 ft.

Latest reported development in the YAK series was the YAK-11, a single seater fitted with a 2,000 h.p. liquid cooled engine. It is normally armed with one 37-mm. cannon and two 12.7-mm. guns. Top speed was "over 390 m.p.h."

Fastest soviet fighter in the records was the 400-m.p.h. MIG-5. It has a 2,100 h.p. 14-cylinder radial auxiliary fan-cooled engine. Four 20-mm. cannon are mounted.

During the war the Il-2 Stormovik was famous as one of the first rocket-carrying, ground-strafting aircraft. It was used effectively against tanks and ground troops. An improved version, the Il-10, was reported as a two-place anti-tank support bomber. With an 1,800 h.p. M-107 engine it was said to have a top speed of about 250 m.p.h.

Several models of twin-engined attack bombers were used during the war, the PE-3 being typical. These machines resembled the Messerschmitt 110-210-410 series, but the engines were 14-cylinder air cooled instead of the inverted liquid-cooled types favoured by the nazis. After the war the PE-3s were being replaced by an improved machine of the same general characteristics, the TU-2 designed by A. N. Tupolev.

Another twin-engine design, the ER-4, is recognizable by its inverted gull-type wing. It is powered by two M-103 series, upright Vee liquid-cooled engines.

No reports were circulated as to actual aircraft production rates in the U.S.S.R. Large factories were known to exist, but little information was available as to their capabilities or the quality of their products.

Something was known, however, of what was done for the soviet air force by the United States under lend-lease. According to the *Twentieth Report to Congress on Lend-Lease Operations*, by the end of June 1945 the U.S. had shipped to U.S.S.R. about \$1,300,000,000 worth of aircraft, engines and parts. These included 14,450 aeroplanes (including 9,700 fighters and 3,800 bombers) and spares to maintain them. A few British DH-98 Mosquitoes and Handley Page Hampden medium bombers were also delivered.

Great Britain.—The story of British aircraft growth in 1946 centred around intensive development of turbo-jet engines. Early in the year the air ministry announced that for the future, except for troop transports and trainers, every new British military aircraft type must be powered by jet engines.

This directive could not be translated into practice immediately. Most R.A.F. service squadrons were still flying with the old "up and down" type engines and conventional propellers, but the order gave tremendous impetus to the development of gas turbine power units and started practically all aircraft designs off on projects built around such units. Many of the most highly developed jet engines in the world in 1946 carried British name plates.

Two types of units were in production, the straight jet engine, in which all the thrust is developed from a rearward blast of hot gases, and the combination propeller and jet engine, in which gas turbines drive conventional propellers to produce part of the thrust—supplemented by a rearward blast of hot exhaust gas. Each has its advantages. The all-jet type is most useful at extremely high speeds as in fighter aircraft. The combination is applicable to designs (say long-range bombers) where high efficiencies over a wide speed range are desired.

The general characteristics of the British gas turbine power units of 1946 (condensed from a table published in *Flight Magazine*, 50:568, Nov. 21, 1946) are as follows:

MAKER	TYPE	Maximum Power (Sea level)			Dry Weight, lb.
		THRUST LB.	SHAFT H.P.	At r.p.m.	
Armstrong-Siddeley . .	Python	1,150	3,670	8,000	2,980
	Mamba	320	1,010	14,500	750
Bristol	Theseus	500	1,950	8,200	2,310
De Havilland	Goblin II	3,000	—	10,200	1,550
Metro-Vickers	Ghost	5,000	—	—	2,011
	F 2/4	3,500	—	7,700	1,785
	F 3	4,600	—	7,390	2,300
Rolls-Royce	Derwent	3,500	—	14,700	1,250
	Nene	5,000	—	12,300	1,600
	Clyde	1,225	3,020	6,000	2,800

These are the British power units that were announced, whose characteristics were broadcast. Some of them were already on sale in 1946, built into fighters for export to other countries. No straining of the imagination is necessary, however, to surmise that behind the scenes, securely locked away, were still newer and more powerful types.

Britain's Jet-Powered Aircraft.—Except possibly for the German Me-262 jet-fighter effort of 1943-44, Great Britain probably produced more of the type than any other country in the world. It probably had more trained and organized jet squadrons than any other power. Listed in its jet-fighter categories at the end of 1946 were: The De Havilland, Vampire and Sea Vampire, the Gloster Meteor F, the Saunders-Roe S.R./Ar 1 and the Vickers-Armstrongs (supermarine) Eto/44.

Oldest of the service-tested jets are the Vampires. These are single-seat fighters in the 550-m.p.h. class. Their fuselages are very short, with pilot's cockpit forward and a DH Goblin II turbo-jet unit in the afterportion. Tail surfaces are carried on twin booms aft, with the stabilizer raised well above the blast of the jet. Besides being in service with R.A.F. squadrons, Vampires were delivered to both the Swiss and the Swedish air forces. The Sea Vampire is essentially the same machine adapted for landings on carrier decks and otherwise fitted out to fleet specifications.

The Gloster Meteor IV held the world's speed record, up to the end of 1946, at 616 m.p.h. At year's end it was in accelerated production for deliveries to R.A.F. squadrons. One was on exhibit at the Paris show. It is a stubby-winged single-seater, powered by two Rolls-Royce Derwent V's mounted outboard from the fuselage in two relatively large nacelles. The narrow fuselage carries the pilot's cockpit well forward and the tail surfaces high above the twin jet blasts. As a strictly service type, the Meteor carries four 20-mm. cannon, and as an alternate to auxiliary fuel tanks, can carry two 1,000-lb. bombs, or an equivalent battery of rockets. Later production models would be fitted with pressurized cockpits for operation at better than 40,000-ft. altitudes. Top speed with military load was about 580 m.p.h. at 15,000 ft. Calculated rate of climb at 50,000 ft. was said to be more than 500 ft. per minute.

The S.R./Ar 1 is a radical departure in fighter aircraft in that it is a flying boat. This type was heretofore not considered applicable to single-seat high-speed use, largely because of the difficulties imposed by the installation of conventional engine and propellers, with the necessity of keeping them "high and dry" with respect to the water.

The use of twin jet units built into a boat hull has gotten around this trouble. Little was known of its performance, except that it was said to do better than 500 m.p.h. Only photographs of models were published.

Few reliable data were available on the Supermarine Eto/44 except that it is powered with a 5,000-lb. thrust Rolls-Royce Nene turbo-jet engine. Its fuselage has the form of a slender, well-pointed cigar. The single cockpit is well forward. Air intake for the turbine unit is through "gills" in the sides of the fuselage at the cockpit. The "laminar-flow" wings are narrow with a span of about 36 ft. A 310-gal. fuel supply is carried inboard. The normal service version is fitted with four 20-mm. cannon, "Better than 600 m.p.h." was claimed.

One British commentator predicted that four or five years hence a typical fighter would be powered with a pair of in-board jet units of 5,000-6,000-lb. thrust each. With swept-back wings and other aerodynamic refinements "speeds close to 700 m.p.h. may be realized."

Britain also appeared to be in the race to be the first to penetrate the trans-sonic "wall" and to fly experimental piloted aircraft at super-sonic speeds. Its 1946 effort ended in disaster, when the DH-108 experimental tailless jet-propelled monoplane disintegrated in the air with the loss of one of its best pilots, Geoffrey de Havilland. The U.S. would probably make its bid for the honour, when further test flights with the Bell XS-1 were undertaken in the spring of 1947.

During 1946 the British abandoned (for economy reasons, and possibly only temporarily) a 1,000-m.p.h. piloted-aircraft project known as the Miles M-52. The machine would have resembled a German V-2 with a thin monoplane wing about amidships. A special composite turbo-jet unit of very large size had been developed for the M-52 by Power Jets, Ltd. It was expected that the machine would attain an altitude of 36,000 ft. and a speed of 1,000 m.p.h. within 90 seconds of take-off. The entire nose cone, in which the pilot was located, could be blown off the rest of the machine and let down to earth by a large parachute in case anything went wrong. The project was fantastic, perhaps, but not improbable of accomplishment.

Mention was made above of the DH-108 tailless machine. The British always had more of an urge to explore this field than had the U.S. designers, although it is of interest to observe that the U.S.A.A.F. possessed the only practical military "flying wing" in existence, the Northrop B-35 bomber.

A number of turbo-jet and turbine-driven propeller design studies for "all wing" aircraft appeared on British drawing boards in 1946. Apart from the ill-fated DH-108, however, the only tangible evidence of interest was considerable full scale research with a large tailless towed glider, the Armstrong-Whitworth 52G. "Spear-head" designs for large bombers and transports appeared on paper but none in the air.

Jet-powered bombers of more nearly conventional form were probably

CONSOLIDATED VULTEE XB-36, world's largest land-based bomber, which made its first successful flight in Aug. 1946, is shown with a B-29 Superfortress to indicate its size. The pusher type U.S. army air forces bomber has six engines with a total take off power of 18,000 h.p., a length of 163 ft., wing span of 230 ft. and maximum range with bomb load of 10,000 mi.

closer to reality. The only big machine to be flown on jets, and only as a sort of flying test stand for the power units, was a modified four-engine Lancastrian fitted with a pair of piston engines inboard and with Rolls-Royce Nene turbo-jets in the outboard nacelles. This machine was flown from London to Paris during the show in 50 min. The high fuel consumption of current turbo-jet engines still stood in the way of widespread adaptation of the type of bombers and transports, where long range with heavy bomb loads and/or cargo is a primary requirement.

Current Service Types.—A survey of British military aircraft of 1946 would be incomplete without a brief review of the latest versions of the aircraft that opposed the Luftwaffe in the final phases of the war. In spite of the emphasis on jet power, such machines still formed the backbone of the R.A.F.

In the big bomber category, the Avro Lincoln was the only notable addition. It was developed as a long range "heavy" for use in the Pacific theatre. It was designed to carry a 22,000-lb. bomb load, with a normal all-up weight of 82,000 lb. It is powered with four Rolls-Royce Merlin engines, each having a rating of 1,565 h.p. at 17,250 ft. altitude.

During the year another experimental four-engine bomber was flown, the Vickers-Armstrongs Windsor, with Rolls-Royce Merlins. This machine appeared to be notable only in the use of the so-called "geodetic" construction system (similar to that of the Wellingtons used in the early stages of the war) and in an unusual landing gear. It has four main landing wheels, one under, and retracting into, each of the four-engine nacelles.

The De Havilland Mosquito—light, high-speed bomber (2 Merlins)—appeared in an improved form as the MK-35. It was to carry a single 4,000-lb. bomb, or four 500-pounders internally. As the MK-34, it served as a high-speed, long-range reconnaissance machine. In this model, aerial cameras replace the normal armament.

Most famous, and also most highly developed of any single-seat fighter, was the Supermarine Spitfire. The MK-22 embodied all the experience gained in wartime. It would operate in any climate. It carries the standard complement of four 20-mm. cannon. Three 500-lb. bombs, or a battery of rockets, may be accommodated for short-range use. Power plant is the Rolls-Royce Griffon (2,145 h.p. at 15,500 ft.). A six-blade contra-rotating Rotol propeller may be fitted. Top speed was 460 m.p.h. The naval version is the Seafire 47 which differs mainly in having full deck landing equipment installed, plus folding wings for shipboard stowage.

The Supermarine Spitfire is an improvement over the Spitfire. Spitfire's naval counterpart is Seafang. The Griffon engine is used in each. These machines are among the fastest propeller-driven aircraft in the world, at 483 and 475 m.p.h. respectively. They can carry two 1,000-lb. bombs in addition to the standard battery of four 20-mm. guns.

Hawker's Fury and Sea Fury are in the same class with Spitfire and Seafang. The standard machines are powered with Bristol Centaurus engines, but in one model a Napier Sabre MK VII has been fitted, which, with methanol-water injection, gives short duration speeds of 485 m.p.h. The Hawker Tempest, which went into service at about the end of the war, is an all-round fighter with a top speed of 440 m.p.h. A Bristol Centaurus is its standard power plant.

A new name in the field is Martin-Baker, producer of the M-B V single-seat, single-engine fighter. It was said to have unique constructional features, but its outward appearance is conventional. Power plant is the Rolls-Royce Griffon driving a six-blade, contra-prop. Speed was said to be about 460 m.p.h.

In the twin-engined, single-seat fighter category are the De Havilland Hornet and Sea Hornet. Both types are powered by a pair of Rolls-Royce Merlins in conventional nacelle mountings. The experimental Westland Welkin is in the same class with the same engines.

Bristol Beauforts and Beaufighters implemented Britain's attack- and dive-bomber squadrons throughout the war. The postwar model is the Brigand, a versatile three-place machine that can operate as a fighter, dive bomber, mine layer or torpedo carrier. With two Bristol Centaurus engines, it had a top speed of 365 m.p.h. at 16,000 ft. Four 20-mm. guns are carried in the fuselage. It has an all-up weight of 24,600 lb.

There was very notable improvement in naval aviation equipment in England, postwar. The British went in with obsolete Vickers Supermarine Walrus on their cruisers' catapults and obsolescent Fairey Fireflys and Fulmars on their carrier decks. They came out, not only with the several excellent piston-engined and jet-powered deck fighters that have been listed, but also with a group of first rate dive bombers and torpedo carriers for off-the-deck use. The list includes: the Fairey two-place Spearfish T.D. MK 1, a 21,500-lb. machine with a Bristol Centaurus; the Blackburn Firebrand T.F. MK IV single place "strike" aircraft weighing 16,200 lb. with about 350 m.p.h. at 13,000 ft. and the Mark IV Fairey Firefly, a lighter, faster (386 m.p.h. at 14,000 ft.) two-place reconnaissance and day and night fighter powered with a Rolls-Royce Griffon 74 engine. A twin-engine fighter-bomber, the Short Sturgeon, with two Rolls-Royce Merlins, was the first of its kind to be designed for carrier operation. It was reported to fly more than 400 m.p.h. at 19,000 ft.

A new, large flying boat, the Short Shetland, was flying in 1946. It is designed for long-range reconnaissance. Four Bristol Hercules sleeve-valve engines are fitted. It had a top speed of 267 m.p.h.

A new and unique amphibian designed for naval service was the Supermarine 14/44. It has a variable incidence wing and is rigged for deck, runway or water landings. A single Rolls-Royce Griffon driving a six-blade contra-prop furnishes the power. No performance figures were given.

A number of new military trainers came in during 1946. The secondary and advanced types tended to be indistinguishable from certain obsolescent service machines. Probably for final stage training of high-speed pilots for forthcoming jet machines, at least two of the wartime top-ranking fighters, the Spitfire and the Firefly, were modified to be two-seaters, with an instructor's cockpit installed in the turtledeck aft of the regular cockpit and at a higher level. A similar arrangement is shown in the Miles Martinet. Newcomers in the twin-engine trainer class are the Reid and Sigrist Desford and the twin Centaurus Bristol Buckmaster. The new Boulton and Paul P.108 was the first trainer in the world designed around a turbine-propeller unit (the Armstrong-Siddeley Mamba or the Rolls-Royce Dart).

Britain was building a whole series of medium-to-large 2- and 4-engine civil air transports, which, of course, might eventually serve as troop carriers. In the twin-engine group is the 8-passenger DH Dove, for feeder lines (two Gypsy Queen engines); the 24-passenger Vickers Viking for the British European services (2 Bristol Hercules) and the deep-bellied Bristol Wayfarer for passengers or cargo (2 Hercules). For longer ranges is the four-engine group: the Avro York, developed from the Lancaster bomber; the Avro Tudor I Atlantic type for 24 passengers for 3,400 mi. (4 Rolls-Royce Merlins); the Avro Tudor II, with accommodations for 40 passengers (4 Rolls-Royce Merlin 100s), and the Handley Page Hermes, of similar size, but powered with Bristol Hercules engines. The Miles Marathon is a smaller 4-engine machine for 13-18 passengers for intermediate stage runs. On the other end of the scale comes the projected (under construction in 1946) Brabazon Type I (Bristol Model 167 MKI). It would be the largest landplane in England. The prototype was to be powered by eight Centaurus engines, coupled in pairs driving six-blade contra-props; engines were to be completely buried in the wings. Later models were to be turbine-driven. Bacher, Robert Fox (1905—), U.S. physicist, was born Aug. 31 in Loudonville, O. After receiving his Ph.D. degree from the University of Michigan in Ann Arbor in 1930, he was National Research fellow in physics at the California Institute of Technology and at the

Massachusetts Institute of Technology. In 1934 he went to Columbia university as instructor and the following year joined the Cornell university faculty, becoming physics professor and director of the laboratory of nuclear physics. In addition, he became research associate at the M.I.T. radiation laboratory in 1941. A specialist in spectroscopy, he added to the scientific knowledge of the behaviour of atomic nucleus and determined the speed of slow neutrons. Associated with Dr. Robert Oppenheimer at Los Alamos laboratory in New Mexico, he had charge of the manufacture of the first test atomic bomb that was exploded there. On Oct. 28, 1946, he was appointed by Pres. Truman to the five-man U.S. atomic board which, with David E. Lilienthal as chairman, was given the responsibility of directing and controlling the development of atomic energy in the U.S. The only scientist on the board, Bacher's task was to furnish technical experience to the commission.

Bacon. The increased slaughter of hogs in the United States in 1946 over 1945 was reflected in the increased output of bacon although this meat continued very scarce in the retail markets until the end of the year. The amount of bacon was reduced by the practice of cutting pork to carry as much fat as possible. The quantity of bacon produced as sliced bacon under federal inspection was about 400,000,000 lb. in 1946 compared with 382,675,000 lb. in 1945 and 549,857,000 lb. in 1944 and a previous five-year average of about 350,000,000 lb. The inspected sliced bacon does not represent the total production, however, since about 19% of the dressed weight of hogs is usually classed as bacon. By this method of estimating, the total production of bacon was more than 2,100,000,000 lb. in 1946 compared with 1,909,000,000 lb. in 1945 and the record of 2,536,000,000 lb. in 1943.

Government purchasing was ended on July 1, 1946. The lapse of price control on pork in July and August resulted in a rapid increase of demand for a brief period. After price control was finally ended in late fall bacon production began to increase to meet the domestic demand. The price of bacon continued to the end of the year above the ceiling level. (See also HOGS; MEAT.) (J. C. Ms.)

Bacteriology. Electron microscopy continued to develop in 1946. The preparation of collodion "replicas" of moist, living bacteria followed by "shadowing" of the surface of the replica with gold vapour applied obliquely is noteworthy. By improving the annular electromagnets which are the "lenses" of the electron microscope, the resolving power of these instruments was more than doubled. The further perfection of the metal-shadowing technique permitted the making of electronographs of viruses and bacteria in perspective or topographical aspect, with revelations of morphological details not previously known.

An important advance in optical methods was the further development of phase microscopy to general use. This is based on dark-field illumination coupled with special diffraction plates in the objective housing. Portions (phases) of the cell having different refractive indices are made visible as differences in light intensity.

A great volume of new information on antibiotics was published. Among many important publications were authoritative summaries of the therapeutic value of streptomycin; the chemical structure and synthesis of penicillin; the different values of four different penicillins, G, F, X and K; and improved large-scale commercial development of the submerged or closed-tank method of preparation. The production of the pure sodium salt of penicillin G on a commercial scale was a logical outcome of studies in this field. Penicillin K was found of little value *in vivo*

GABRIEL BERTRAND, French bacteriologist, demonstrates a new preservative, microlysine, in Paris, France, during 1946. Two drops are sufficient to preserve this quantity of milk without refrigeration for as long as four or five days, even in warm temperatures

because it is almost immediately destroyed or excreted. G appeared to be most valuable, especially in treatment of syphilis. A synthetic medium for submerged penicillin production gave promising results under commercial conditions.

The great search for new antibiotics was continued and apparently valuable substances were found in scores of moulds and actinomycetes and in several higher plants (beans, corn, cabbage, buttercup, sagebrush, dwarf waterleaf, mountain pasque, juniper and others).

In the field of disinfectants several compounds having surface-tension-reducent as well as bactericidal properties were studied intensively. Among these were various complex cetyl halides of the group of quaternary ammonium salts.

Students of enteric disease described several new types of *Salmonella* and many valuable epidemiological reports of shigella and salmonella outbreaks based on military groups were published. Of especial interest were data on difficulty in producing shigella infection in man experimentally and the ineffectiveness, in man, of shigella vaccines, apparently effective by animal test; emphasizing Alexandre Besredka's idea that local tissue immunity may be more important than humoral immunity.

In diphtheriology it was shown that nontoxigenic diphtheria bacilli probably play an important role in natural immunization processes and may possess hitherto unsuspected pathogenic potentialities for man. A new diphtheria prophylactic, protamine toxoid, gave promise in respect to antigenicity and freedom from allergic reactions. Encouraging data were also obtained in active artificial immunity to mumps, as well as to other virus diseases, including influenza.

The newly opened field of biochemical genetics was further illuminated by new studies on the relation of radiations and of nucleoproteins to the synthesis of enzymes. The use of radioactive elements as tracers in studying bacterial metabolism received fresh impetus from the increased availability of the elements as byproducts of atomic research.

Very thorough investigations were conducted on some newly described diseases, notably Q fever and infectious hepatitis, as well as a brand new rickettsial disease—"pock fever"—in New York city. (See also EPIDEMICS AND PUBLIC HEALTH CONTROL.)

Badminton. Out of competition after 1942 because of army medical corps duty, David Guthrie Freeman, the four-time national champion, completely dominated the badminton-picture in 1946. Although the national championship was again by-passed, Freeman established his ranking as No. 1 in world badminton circles with a domination of California tournaments. He won both the northern and southern California men's singles, defeating a fellow Pasadena, Calif., player, Barney McCay, in each final. Freeman won the northern title, 15-12, 15-11, and the southern crown, 15-5, 15-1.

Thelma Scovil of San Francisco won the southern California women's title, while Shirley Blanchet of the Athens, Calif., Athletic Club captured the northern crown.

Carl Loveday of Montclair, N.J., ranking U.S. No. 2 player, dominated play in the east with men's singles victories in the Buffalo, N.Y., national invitational and the eastern championships.

Mrs. Patsy Donovan Starrett of Buffalo won the national invitational singles. Loveday also teamed with Ken Quigley, his victim in the singles, to annex the men's doubles title.

Mrs. Starrett figured in a twin title by teaming with Barbara Templeton for the women's doubles championship. They also won the eastern doubles.

Richard Casey of St. Louis once again dominated men's singles in the midwest championships, defeating Russell Smith, also of St. Louis, 18-17, 15-11, in the final. Eleanor Coombs of Chicago regained the women's singles title she held in 1944.

Stanley Cutts of Toronto, Ont., won the world's professional championship with an easy 15-5, 15-6 victory over Doug Grant of Montreal, Que. In a return match, Cutts defeated Grant, 15-0, 15-2. (M. P. W.)

Bagley, William Chandler (1874-1946), U.S. educator and editor, was born on March 15 in Detroit. His degrees included a B.S. from Michigan State college, E. Lansing, Mich. (1895), an M.S. from the University of Wisconsin, Madison, Wis. (1898) and a Ph.D. from Cornell university, Ithaca, N.Y. (1900). He began teaching in the public schools in 1895. He was appointed professor of education at the University of Illinois in 1908 and at Teachers college, Columbia university, 1917, retiring from the latter institution as professor emeritus in 1940. A member of the "essentialist" movement, founded in 1938, Dr. Bagley and his followers championed the cause of sound orthodox education as opposed to progressive education theories. He was president of the National Society for the Study of Education, 1911-12, a member of the National Education association and editor of its journal, 1920-25, president of the National Council of Education, 1931-37 and editor of the weekly *School and Society*, 1939.

Among his works are *The Educative Process* (1905), *Classroom Management* (1907), *Craftsmanship in Teaching* (1911), *School Discipline* (1915), *Determinism in Education* (1925), *Education, Crime and Social Progress* (1931), *Education and Emergent Man* (1934) and *A Century of the Univer-*

sal School (1937). He was co-author with Charles A. Beard of several history books. Bagley died in New York city on July 1.

Bahamas. An archipelago of about 3,000 islands, islets (or cays) and rocks, east of Florida and north of Cuba, extending about 800 mi. in length, lying between 21° and 27° north latitude and 72° and 79° west longitude. The islands are organized politically as a British crown colony and are considered as part of the western group of British West Indies. The capital and only city of importance is Nassau (pop., 1945 est., 20,000). Area: 4,403.5 sq.mi.; pop. (1943 census): 68,846, of whom 29,391 were on the island of New Providence. Racial distribution is about 87% Negro and 13% white, chiefly of British origin. The constitution of the crown colony (granted in 1728) provides for a legislative council of 9 crown-appointed members, a house of assembly of 29 elected members from 15 districts, and a crown-appointed governor aided by an executive council of not more than 9 members. Governor in 1946: William L. Murphy.

History.—Problems of peacetime reconversion and political reorganization affected the Bahamas during 1946. The colonial government and private organizations were concerned with a revival of the considerable prewar tourist trade and took an important part in the intercolonial discussions looking toward that end. Bahaman representatives participated in the Caribbean tourist conference held at New York city, Sept. 30-Oct. 8, 1946. The Bahamas were less interested than other British West Indian colonies in the possibilities of colonial federation in that area, a policy being actively pushed by officials in Great Britain. The house of assembly voted on July 23 to extend the secret ballot, previously restricted to New Providence, to the Out Islands; the step had long been urged.

Education.—Primary education is compulsory. At the beginning of 1944 the islands had 66 nonsectarian government schools with an enrolment of 8,580, 51 aided schools with an enrolment of 2,441, and 54 denominational and private schools with an enrolment of 3,550. The total government contribution to education in 1943 was £38,819. The government in 1946 was considering plans for a new high school for Nassau.

Finance.—The monetary unit is the pound sterling, linked to the pound in London. Revised 1945 budget figures set expenditures at £700,000 and revenues at £580,035, with an estimated surplus at the beginning of 1946 of £618,052. Budgetary prospects were for a heavy treasury deficit in 1946, however, leading Gov. Murphy strongly to urge a broader economic base for the islands. The debt in 1944 was £245,000. Bahaman farm labourers in the United States continued to remit a portion of their earnings to the islands in 1946 but the amount was considerably less than in previous years.

Trade and Communication.—The year 1946 continued to reflect the normally unfavourable trade balance characteristic of the Bahamas. Principal exports are straw and shellwork, vegetables and fruits, and fibres; the chief imports are manufactured articles and foodstuffs. The highly successful tourist season in 1945-46 helped materially to compensate for the adverse balance of trade. Dominion sales dropped considerably with the departure of several thousand British troops previously stationed in the colony.

The Bahamas have no railroads and only an inadequate highway system, the latter almost entirely on New Providence island. Daily plane service is maintained between Nassau and Miami, Florida, by Pan American Airways and the islands are also served by British West Indian Airways.

Agriculture.—Tomato raising was easily the most profitable farming activity in 1946. Some 350 small farmers concerned chiefly with tomato culture formed an association in the early

part of the year, with a pledge of government assistance in providing seed, fertilizer and crates. The tomato industry is dominated by five large growers whose holdings total 1,700 ac. Some optimism was felt during the year over the possible further recovery of the sponge-fishing industry, devastated by disease in 1938-39.

Mining.—Bahamans were greatly interested in 1946 in the possibility of development of petroleum resources. The first oil well drilling ever undertaken in the islands began April 24, after an investment of about \$1,000,000. A Bahaman subsidiary of Standard Oil of New Jersey announced in mid-year that it would employ radar to search for oil beneath the ocean floor off the Bahamas, and by Aug. 28, seven companies were reported preparing to begin drilling operations. Surveys concentrated in the area around Southern Andros, the westernmost island, although the total ocean-floor area potentially involved was 44,000 sq.mi. Plans were announced late in 1946 for the sinking of a deep marine well near Grand Bahama, beginning early in 1947.

Baird, John Logie (1888-1946), British inventor, was born Aug. 13, in Helensburgh, Scotland. For his early career see *Encyclopædia Britannica*. A pioneer in transmission of images by wire and radio, Baird successfully synchronized televised images and conversation over telegraph wires between London and Glasgow in 1927. A year later, he televised images from London to Hartsdale, N.Y. Mr. Baird, who was a director of his own company, was also consulting technical adviser to Cable and Wireless, Ltd., 1941-46. He died at his home in Bexhill, Sussex, on June 14.

Baker, Ray Stannard ("DAVID GRAYSON") (1870-1946), U.S. author and journalist, was born on April 17 in Lansing, Mich. After graduating from Michigan State college in 1889 with a B.S. degree he began the study of law at the University of Michigan, but relinquished it in favour of literary studies. In 1894 as a newspaper reporter his coverage of the march of Coxey's army brought him commendation and the subeditorship of the *Chicago Record*. He was managing editor of S. S. McClure's syndicate (1897-98), the associate editor of *McClure's* magazine (1899-1905), and one of the editors of the *American* magazine (1906-15). A liberal reform writer, he wrote many books on various subjects and achieved fame as an essayist under the pseudonym of David Grayson. In 1918 he was special commissioner of the state department to Great Britain, France and Italy, and in 1919 served with the American Peace commission under Pres. Woodrow Wilson. Closely associated with Wilson, he became during this time director of the Press bureau of the American Commission to Negotiate Peace and held this post until the president's death. The authorized biographer of Wilson, and an eloquent spokesman for the League of Nations, Baker published the first two volumes of his monumental biography, *Woodrow Wilson—Life and Letters*, in 1927. The seventh and eighth (final) volumes appeared in 1939 and in 1940 he was awarded the Pulitzer prize in biography for these volumes. Under his own name he had published *Seen in Germany* (1901), *Following the Color Line* (1908), *The Spiritual Unrest* (1910), *Woodrow Wilson and World Settlement*, a history of the peace conference, 3 vols. (1922) and with Prof. W. E. Dodd edited *The Public Papers of Woodrow Wilson*, 6 vols. (1925-26). His autobiography, *Native American; The Book of My Youth*, was published in 1941. Under the pseudonym of David Grayson there appeared *Adventures in*

Contentment (1907), *Adventures in Friendship* (1910), *The Friendly Road* (1913), *Hempfield* (1915), *Great Possessions* (1917), *Adventures in Solitude* (1931), *The Countryman's Year* (1936) and *Under My Elm* (1942). He died at Amherst, Mass., on July 12.

Balch, Emily Greene (1867-), U.S. economist, was born Jan. 8 at Jamaica Plain, Mass. After graduation from Bryn Mawr with an A.B. degree in 1889, she studied political economy in Paris, at the University of Chicago and in Berlin. A member of the Wellesley college faculty from 1896 to 1918, she taught economics and was later professor of political economy and political and social science. At the start of World War I, she went overseas and served in army hospitals. Her outspoken views on pacifism were said to have resulted in her dismissal from the Wellesley staff. Miss Balch later entered wholeheartedly into the work of women's peace organizations and after serving as delegate to the International Congress of Women at The Hague, became international secretary of the Women's International League for Peace and Freedom at Geneva, Switzerland (1919-22). She became its honorary international president in 1936. Miss Balch was awarded the Nobel peace prize, Nov. 14, 1946. The peace prize, offered for the first time after the outbreak of war in 1939, was shared by Miss Balch and Dr. John R. Mott, U.S. evangelist.

Baltimore. The metropolis of Maryland, and seventh largest city in the United States. The population according to the federal census of 1940 was 859,100; white, 692,705; non-white, 166,395 (19.4%), mainly Negro. The bureau of the census estimated the civilian population as of July 1945 at 930,000. Land area, 78.72 sq.mi.; water area, 13.21 sq.mi. The mayor in 1946, whose term would expire in 1947 was Theodore R. McKeldin, Republican. Budget appropriations for 1947 totalled \$71,184,383, an increase of 12.5% over the 1946 budget. The city tax rate for 1947 was \$2.96 per \$100 of assessed valuation (state rate, additional 10 cents). The gross funded debt as of Nov. 30, 1946, was \$164,460,000; the net debt was \$124,317,915 (not including income accrued to sinking funds). Percentage of net debt to taxable basis (excluding self-supporting debt) was 4.05%; taxable basis, \$1,860,568,314.

There were 78,889 white students and 35,638 Negro students, ranging from pre-kindergarten through teachers college, enrolled during the school year 1945-46; total, 114,527. The actual enrolment on Sept. 30, 1946, was 71,770 white students and 33,953 Negro students; total 105,723. Dr. William H. Lemmel was superintendent of public instruction in 1946. The department of education is administered as a unit apart from the school system of the rest of the state.

Baltimore's economy was not seriously affected by reconversion after World War II. At the close of 1946 approximately 190,000 persons were employed in manufacturing activities. Leading industries included production of iron and steel, apparel, chemicals, aircraft, electrical goods, distilled liquors, automobile assembly, shipbuilding and ship repairing. Plant investment of \$65,000,000 during 1946 was exceeded only in 1941. Building permits totalled \$60,146,286, an increase of 305% over 1945. Total entrances and clearances of foreign trade shipping were 4,077 vessels of 16,016,945 net registered tons, exceeding

the previous year's tonnage by 41%. While shipments of coal and grain were heavy in the aggregate, the port's prewar general exports were revived, and steel and ores began moving in volume. On June 30, 1946, resources of Baltimore's banks totalled \$1,535,682,678, representing slightly more than 71% of the bank resources of all Maryland. (J. S. A.)

Bank for International Settlements.

The 16th annual meeting of the Bank for International Settlements was held on May 27, 1946, at Basle, Switzerland. The balance sheet and the profit and loss account, covering the fiscal year ending March 31, 1946, were approved. Unlike the previous year, when a profit of 4,429,562 Swiss gold francs was made, the fiscal year 1945 saw a net loss of 616,581 Swiss gold francs which was chiefly the result of the great reduction in income from the bank's funds invested in Germany. The deficit was met by transfer from a special suspense account set up in 1945, when this contingency was foreseen. The balance sheet of the bank of March 31, 1946, showed assets amounting to 451,357,502 Swiss gold francs, as against 458,725,324 Swiss gold francs on March 31, 1945. Gold in bars and coins and other cash amounted to 133,861,079 Swiss gold francs or 29.6% of total assets; long-term deposits were 228,909,375 Swiss gold francs or 50.7% of total liabilities. Short-term and sight deposits in gold and various currencies amounted to 21,697,692 Swiss gold francs, or less than 4% of total liabilities. The bank was capitalized at 500,000,000 Swiss gold francs of which 25% or 125,000,000 Swiss gold francs were paid up.

The annual report of President Thomas H. McKittrick discussed price and cost movements in the return to a peacetime economy, the change in the direction of European foreign trade, the dangers of inflation and the fear of a coming postwar depression. It examined the maintenance of price and wage controls and their relation to rationing and subsidies, and came to the conclusion that these measures have very definite limitations, and that a freezing of prices tends to hinder rather than help economic progress. It pointed out that price control needs a high standard of administrative ability and that the task of administrators has become more difficult in the postwar era since the general public no longer has a definite objective like winning the war.

The report points to the progress made since termination of hostilities in the settlement of lend-lease obligations and the provision of foreign resources through payments agreements and international loans, and notes that transition to peacetime activities proceeded more smoothly than was expected, although various bottlenecks, especially due to the lack of food and raw materials, notably coal, appeared.

Numerous important changes in the staff of the Bank for International Settlements took place in 1946, the most notable among them the resignation of Camille Gutt from the board of directors in order to accept the position as managing director of the International Monetary fund, and the resignation of Thomas H. McKittrick from the post of president of the bank to join the Chase National Bank of New York. (B. F. H.)

Bankhead, John Hollis, Jr. (1872-1946), U.S. politician, was born on July 8 in Lamar, Ala. His father, John Hollis Bankhead, had been a senator before him, and his brother, William Bankhead, had been a speaker of the house of representatives. John Bankhead

was graduated from the University of Alabama, University, Ala., in 1891 and received his law degree at Georgetown university, Washington, D.C., in 1893. After leaving school he practiced law in his home state, becoming head of a prosperous legal firm which specialized in handling corporation work. In 1903 he served in the state legislature and authored the Alabama election law, which set up barriers to prevent Negroes in the state from voting. After the death of his father in 1920 John Bankhead entered Alabama politics, and in 1931 he was elected senator from the state. His fitness for the post, however, was challenged by Thomas Heflin, who charged that Bankhead was a tool of the power interests. Bankhead's election, however, was confirmed by the senate. While he was one of the staunchest supporters of the Roosevelt administration, Bankhead disapproved of the Wagner-Costigan lynching bill designed to make lynching a federal offense. He actively supported the Farm Tenancy bill, authored the Cotton Control act (adopted in 1934 and repealed two years later) and opposed price ceilings on cotton. While attending a session of the Senate Banking and Currency committee, he suffered a stroke and died at Bethesda, Md., on June 12.

Banking. Outstanding banking developments in the United States during 1946 centred about the treasury's debt retirement program and a revival of loan demand. Retirement of called or matured marketable government securities from war loan balances built up in the Victory Loan drive brought about the first decrease in total earning assets of commercial banks and total deposits since before World War II. Private deposits, however, continued to increase. There was a vigorous demand for commercial and industrial loans, consumer credit, and urban and rural mortgage loans at banks.

Net profits of commercial banks during the first half of 1946 were somewhat greater than in the same period of 1945. For all member banks the ratio of net profits on an annual basis to total capital accounts was 11.1%, virtually the same as in the first half of 1945. Current earnings were higher. Although total earning assets declined, the average yield on holdings of United States government securities was higher because of lengthened maturities, and earnings on loans increased substantially. All major items of expense, particularly salaries and wages, continued to rise.

On March 1, 1946, the treasury began a program of debt retirement which continued through the rest of the year, not out of a surplus of tax receipts over expenditures, but from the large treasury cash balance built up during the Victory Loan drive in Dec. 1945. Between Feb. 28 and Dec. 18 the treasury retired \$23,300,000,000 of called or matured marketable government securities. Correspondingly treasury war loan balances with commercial banks throughout the country were reduced from \$24,400,000,000 to \$2,200,000,000, or by \$22,200,000,000. In the same period the total public debt was reduced by \$20,500,000,000; the difference between this figure and the retirement of marketable issues being accounted for chiefly by an increase in nonmarketable obligations. In gauging the effects of the debt retirement program, a distinction must be drawn between the immediate and subsequent impact on the money markets and among the various classes of holders of the retired securities. When commercial banks held the retired securities, holdings of government securities by commercial banks and their war loan deposits declined. When federal reserve banks held the retired securities, in the first instance, holdings of government securities by federal reserve banks, member bank reserve balances and war loan deposits in commercial banks declined. Commercial banks were forced to sell short-term government obligations in the market to the reserve banks in order to replenish their re-

serve balances. The ultimate effect of retirement of securities held by the reserve banks, therefore, was similar to that of retirement of securities held by commercial banks, in that holdings of government securities by commercial banks and war loan deposits declined. The adjustment of reserve positions by commercial banks necessitated by retirement of government obligations held by the reserve banks, however, was an important influence tightening the money market. When nonbank investors held the retired securities, war loan deposits declined but private deposits increased, leaving total deposits in commercial banks unchanged. Private deposits, however, were subject to reserve requirements, whereas war loan deposits were not, so that retirement of securities held by nonbank investors had the effect of increasing required reserves somewhat. The major portion of the retired securities was held by commercial banks and federal reserve banks, and the major effect of the debt retirement program upon ownership of government securities was to lessen the holdings of short-term securities by commercial banks.

The speculative demand for bonds which had characterized market developments during 1945 continued to drive bond prices to high premiums and push market rates of interest down through the first few months of 1946. In terms of monthly averages of daily figures, the yield on taxable government bonds of 7 to 9 years declined to 1.28% in March, the yield on taxable government bonds 15 years and over to 2.08% in April, the yield on high-grade municipal bonds to 1.45% in April and the yield on high-grade corporate bonds to 2.35% in March. Beginning with the initiation of the treasury's debt retirement program, there was a slight firming of short-term interest rates in the money market and bond yields. Rates on treasury bills were pegged by the federal reserve buying rate, however, and rates on certificates of indebtedness were supported by federal reserve purchases. The debt retirement program put pressure upon the banks' reserve positions, and the federal reserve preferential rate on loans secured by government obligations of one year maturity or less was discontinued. The federal reserve bank buying rates on acceptances were advanced. There were increases in open-market rates on bankers' acceptances, commercial paper and stock exchange call and time loans. A rise in the demand for real estate mortgage credits, some increase in state and municipal new security offerings, an expansion in consumer credit and business needs for funds provided alternatives to some extent to the purchase of government bonds. In December, the yield on taxable government bonds of 7 to 9 years was 1.56%, the yield on taxable government bonds 15 years and over was 2.24% and the yield on high-grade corporate bonds was 2.55%. Spreads between high-grade and lower-grade corporate bonds showed some tendency to widen.

The amount of corporate security issues for refunding offered during 1946 was less than in 1945 but greater than in other recent years. The elimination of the excess profits tax effective Jan. 1, 1946, and a narrowing margin between interest rates on new securities and on the refunded issues restrained refinancing activities. Corporate security flotations for new capital reached a much higher level in 1946 than in other recent years. There was a substantial demand for funds by business enterprises to finance reconversion and expansion. On the other hand, the stock market break in September adversely affected new security flotations. (See also BUSINESS REVIEW; CONSUMER CREDIT; LAW; PRICE ADMINISTRATION, OFFICE OF.)

Mutual Savings Banks.—On Dec. 23, 1946, there were 531 mutual savings banks and 151 branches in operation in the United States. Although one bank was absorbed by merger during the year, the number of savings bank offices increased through the opening of 13 branch offices, 6 of which were made possible by the 1945 and 1946 changes in the New York

law relating to branches for savings banks.

Savings deposits continued to grow at a substantial rate after V-J day, although less rapidly than in the previous year. In the year ended July 1, 1946, deposits increased \$1,846,557,661 or 12.8%, to a total of \$16,224,970,861. This compared with an increase of \$1,950,327,636, or 15.7% in the year ended July 1, 1945. Assets increased \$2,075,343,084 to a total of \$18,028,676,696; surplus increased \$200,898,801 to a total of \$1,740,773,069. The ratio of surplus to total deposits on July 1, 1946, was 10.7%, the same ratio as prevailed in the previous year. Accounts increased 710,441 or 4.2% to a total of 17,436,174, as compared with an increase of 622,998, or 3.9% in the year ended July 1, 1945.

During World War II and until the end of 1945, savings bank funds available for investment were chiefly invested in U.S. government securities. With the war loan drives over, other types of eligible bonds were increasingly bought. Bonds of the International Bank for Reconstruction and Development were made legal for purchase by savings banks in Delaware, Maryland and New York.

After World War II, savings banks vigorously attacked the problem of rebuilding their mortgage portfolios. In their drive for mortgage loans, the banks paid special attention to the so-called G.I., or veterans' loans provided for under the Servicemen's Readjustment act of 1944. Such loans are guaranteed up to \$4,000 by the Veterans' administration.

On Dec. 1, 1946, commitments by New York savings banks for the construction of savings bank-owned multiple, moderate rental housing totalled \$47,000,000. Actual construction was begun on Parkway village in Queens county, a development to house 687 families, for the use of the United Nations employees under a five-year rental contract with that organization. Other construction was delayed by unprecedentedly high building costs which made it difficult for the savings banks to construct investment housing subject to rent schedules that were socially and economically feasible.

Savings Bank Life Insurance.—In 1946 there was an increase of 13 in the number of savings banks selling savings bank life insurance, bringing the total to 234. Three new agency banks in Massachusetts and two in Connecticut and eight new issuing banks in New York account for the increase. On Aug. 31, 1946, in Massachusetts, there was \$290,546,994 of insurance in force representing 319,989 policies; in New York the insurance in force was \$81,590,303 representing 69,425 policies; in Connecticut, there was \$7,215,739 insurance in force representing 7,747 policies.

Canada.—On March 1 the minister of finance announced a reduction in the interest rate paid by the government on deposit certificates sold to the chartered banks from $\frac{3}{4}$ of 1% per annum to $\frac{5}{8}$ %. Deposit certificates are the type of security used by the government in borrowing directly from the chartered banks, and financing arrangements between the government and the chartered banks had been on the basis of paying an amount to the banks sufficient to cover their costs with only a reasonable margin for profit. It was also announced on March 1 that the chartered banks had agreed that their holdings of dominion government domestic bonds (including guaranteed issues) would not average more than 90% of the amount of their Canadian savings deposits and that their earnings on such dominion government bonds held for investment account should not exceed their operating costs on such savings deposits, including deposit interest and other expense, by more than a moderate profit margin for this type of banking business.

Demand deposits of the chartered banks declined during 1946, with time deposits showing a steady and substantial increase. Security loans declined, while holdings of securities rose. At the

end of August, the chartered banks had total deposits payable in Canada, excluding interbank deposits, of \$5,892,000,000.

Great Britain.—On March 1 the Bank of England began operations as a government institution. Provision was made with respect to the relationship between the treasury, the Bank of England and other banks. The treasury may give such directions to the bank as thought necessary in the public interest. The bank may request information from and make recommendations to commercial banks and, with authorization from the treasury, issue directions to give effect to any such request or recommendation.

The Borrowing (Control and Guarantees) act, 1946, provided for the regulation by the treasury of the borrowing of money and the issuance of securities. Amounts under £10,000 are excluded from regulation, as is borrowing from commercial banks. The treasury was also given power to guarantee any loan if it is satisfied that it is expedient in the public interest to do so for the purpose of facilitating the reconstruction or development of industry. The aggregate capital amount of the loans guaranteed in any one year shall not exceed £50,000,000.

Loans to customers of the London clearing banks rose during the year, as did security holdings. The increase in total deposits during 1946 was greater than the growth during 1945.

The trustee savings banks in Great Britain also had adjustments to make in 1945. In 1944, they reported that 67% of the prewar male staff was serving with his majesty's forces and that the greatly increased business was carried on with temporary and part-time staffs in banking quarters often inadequate for the volume of business done.

The increase in deposits continued after V-J day although, as in the case of savings deposits in the U.S., at a lower rate. Balances in the Ordinary department increased £77,542,273 in the year ended Nov. 20, 1945, to a total of £488,526,684 and in the ten months to Sept. 30, 1946, they increased £47,700,000. Restrictions on the acceptance of deposits in the Special Investment department, which invests funds for depositors in certain securities, in late years caused balances in this department to decline by £1,265,627 to £114,553,313 for the year ended Nov. 20, 1945. There was a further decrease of £2,180,000 in the ten months to Sept. 30, 1946.

Government stock held for depositors' accounts on Nov. 20, 1945, amounted to £71,736,297, an increase of £6,977,343 for the year. In the same period the number of active accounts in the Ordinary department increased by 174,229 to 3,860,459. The number of accounts in the Special Investment department decreased by 9,559 to 338,403, and the number of stockholders increased by 12,722 to a total of 239,318. On Nov. 20, 1945, there were 87 separate trustee savings banks with 770 offices, an increase of 29 offices over the previous year.

Legislation restricting to £2,000 the maximum deposit held by a depositor in the Ordinary department became effective as of Jan. 1, 1946. The only previously existing restriction was one limiting annual deposits to £500. (See also BANK FOR INTERNATIONAL SETTLEMENTS; BANK OF ENGLAND.)

(HE. BR.; J. K. L.)

Bank of England. The outstanding event of 1946 was the transfer of the bank to public ownership March 1. By the Bank of England act, 1946, the capital stock was transferred to a nominee of the treasury (the treasury solicitor), holders receiving in exchange an amount of 3% treasury stock sufficient to yield them the same annual income as they had received for more than 20 years in dividends on bank stock. The court of directors was henceforward to consist of a governor, a deputy governor and 16, in place of 24, directors, all appointed by the king, the first two for five years and the

directors for four years, and eligible for reappointment. Of the new court taking office on March 1 all but three directors had in fact held the same office in the last court elected under private ownership. In other respects also little change was made in the organization and functioning of the bank. It continued as a chartered corporation; and the additional charter granted after the passage of the act was of a purely formal character. In lieu

of its customary dividend the bank was to pay an equivalent sum to the treasury. The court of directors were expressly left to manage the affairs of the bank, subject only to such directions as the treasury might think necessary in the public interest. No such directions might be given without prior consultation with the governor; and it was understood that they were intended to refer only to matters of policy on which the bank was always in close touch with the treasury and had at all times been prepared to bow to the decision of the government of the day. The nonpolitical character of the bank was emphasized by a new provision disqualifying from membership of the court of directors any member of the house of commons, any minister of the crown or anyone serving in a government department and paid out of public funds. At the same time new powers were conferred on the bank to request information from and make recommendations to bankers, and to issue directions, if so authorized by the treasury, for securing their compliance; but with safeguards protecting the affairs of any particular customer and the right of bankers to make representations. Here also there appeared to be a greater measure of formal control: but relations between the bank and bankers generally had been for many years of such a character that it was difficult to foresee the circumstances in which this formalization of the "moral leadership" of the bank would be likely to be put into force. Thus nationalization, although a fundamental change, preserves, if not strengthens, the independence of the bank as the financial adviser of the government, while underlining the latter's final responsibility for monetary policy.

During 1946 no other changes of note occurred in the organization or work of the Bank of England. Its condition at quarterly intervals during the year is shown in the table above, the principal feature being the comparative stability of the note circulation after steady increases from Sept. 1939. The maximum limit of the fiduciary issue, stable at £1,400,000,000 during most of the year, was raised to £1,450,000,000 on Dec. 10, 1946.

Bannerman, Helen (? -1946), British author, was born in Scotland. In 1899, while living in India, she wrote and illustrated the book, *The Story of Little Black Sambo*, that was destined to become a juvenile classic. Originally written for her children, this book was translated into many languages and delighted the children of many countries. Her other illustrated works, which were also set in India, never

reached the popularity of her first book. They include *Sambo and the Twins*, *Little Black Quibba*, *Little Black Quasha* and *The Story of the Teasing Monkey*. She died at Edinburgh, Scotland, on Oct. 13.

Bantock, Sir Granville (1868–1946), British composer, was born on Aug. 7 in London. For his early career see *Encyclopædia Britannica*. Professor of music at Birmingham university for 26 years, he retired in 1934 as professor emeritus. Sir Granville, one of England's leading composers and conductors, wrote numerous songs, choral works, operas and orchestral suites. Among them are the music for Sophocles' *Electra*, Euripides' *The Bacchae*, Aristophanes' *The Frogs*, Percy Bysshe Shelley's *Prometheus Unbound* and Edward Fitzgerald's *Omar Khayyam*; the opera *The Seal-Woman* and his last works, *Pagan Symphony* (1936) and *King Solomon* (1937), commemorating the coronation of King George VI. Sir Granville died on Oct. 16, according to a London report.

Baptist Church. Baptists became increasingly world-minded in 1946. Reports for the year were both disheartening and encouraging. Half of their 275 churches in Germany were ruined. Their seminary in Hamburg was burned, their Publication society's plant in Kassel, Germany, demolished; homes were destroyed, congregations scattered and poverty made payment of salaries prohibitive.

Baptists in Rumania, denied religious freedom by former Premier Ion Antonescu, with the fall of his government (1945), enjoyed rights of conscience.

In the Netherlands Baptists found themselves in 1946 a free people but faced with the necessity of rebuilding their church properties. Fortunately, state aid was expected to be received for this purpose.

In Norway the Baptists persecuted by the invading nazis reported that not one surrendered his faith. In Denmark, suffering similarly, they actually increased in numbers.

Italian Baptists also manifested a new spirit. Attendance at church services increased in 1946. Enjoying larger freedom than under Mussolini, yet, with other evangelicals, they met with police regulations circumscribing their efforts.

Swiss Baptists, neutral during World War II, at its close sent money and truck loads of food and clothing to the needy of other lands.

Statistics for the U.S.S.R. were not definite. Dr. Louie D. Newton, president of the Southern Baptist convention (U.S.), visiting the U.S.S.R. for 25 days in July and Aug. 1946, declared that Baptists there enjoyed religious freedom, numbered nearly 3,000,000, with about 2,500 ordained ministers. A Baptist periodical, the *Brethren Messenger*, started in 1946 and Bibles, hymnbooks and other religious works were printed.

British Baptists, having had more church buildings wrecked during the war than were demolished on the continent, financed their own program in 1946 besides raising a Victory Thanksgiving fund of approximately \$630,000—\$400,000 for local work and the balance for the continent.

In Czechoslovakia the seminary, closed during the war, reopened in 1946. Bohemian Baptists celebrated the centenary of Rev. Henry Novotny, born in Prague, July 12, 1846. He had founded the first Baptist church in Bohemia.

Australian Baptists were visited by Dr. M. E. Dodd, Shreveport, La., during Oct. 1946. Increases in membership followed his evangelistic meetings and large sums were raised for home missions.

Baptists of South Africa founded a Thanksgiving fund of more than \$60,000 for work on the frontiers.

Shanghai university, China, closed at the outbreak of war,

reopened Easter Sunday with 900 students.

The Northern convention (U.S.), with the largest delegation (5,000) in its 40 years' history, met in Grand Rapids, Mich., May 1946. Twenty-five missionaries were appointed to home fields, and about 75 to foreign. The World Mission Crusade for \$14,000,000 above the annual budget of \$5,000,000 was inaugurated.

The Southern convention at Miami, Fla., in May recorded 7,800 messengers. The \$3,500,000 they resolved to raise for European and Asiatic relief by Sept. 30 was oversubscribed by that date.

The executive committee of the Baptist World Alliance (Baptists of the World) meeting in Washington, D.C., May 1946, decided to hold the seventh congress in Copenhagen, Denmark, July 1947. (See also CHURCH MEMBERSHIP.) (R. E. E. H.)

Bar Association, American: see SOCIETIES AND ASSOCIATIONS.

Barbados. An island and British crown colony situated about 100 mi. east of the southern group of Lesser Antilles in the Caribbean sea. Area, 166 sq.mi.; pop. (1946 census), 192,610. The population density of about 1,160 per sq.mi. makes Barbados more densely populated than any other political unit in the world. The population is almost entirely Negro and agricultural. The capital and principal city is Bridgetown (est. pop. 14,000). The government is headed by a royally appointed governor, who is assisted by an executive council, a legislative council of 10 nominated members, and a house of assembly with 24 elected members. Governors in 1946: Sir H. Grattan Bushe, until Oct. 20; Sir Hilary Blood, following that date.

History.—Representatives of Barbados participated in the second Caribbean conference, meeting in the Virgin Islands of the United States in February and March. One of the problems considered which most affected Barbados was that of overpopulation and consequent unemployment in some of the insular possessions. Bridgetown was the scene of a conference of British West Indian labour officials, beginning April 29. Barbados was involved indirectly in plans for the union of the Leeward and Windward Islands colonies, which were actively promoted in 1946, inasmuch as functional amalgamation of services for that island, Trinidad and British Guiana was contemplated in the proposed plan.

Education.—Barbados had 126 elementary schools with an enrolment of 29,695. A teachers' conference, representing British Guiana and the various colonies in the British West Indies, was held in Barbados in Aug. 1946; the next such conference was scheduled for Jamaica in 1948. Preliminary plans were under discussion in 1946 for establishment of a teacher training college in Barbados.

Finance.—The monetary unit is the pound sterling, tied to the pound in London. The 1946–47 budget anticipated revenues of £1,288,820 and expenditures of £1,088,038, leaving a surplus of £200,782; other obligations pointed toward an actual probable deficit for the fiscal year of £4,194. Customs receipts and excise taxes, respectively, were estimated at £625,000 and £180,000. The gross treasury surplus for 1945–46 was £844,000 and the net surplus £710,000. Bridgetown was the location of the West Indian monetary conference, beginning May 13. Delegates were present from Barbados, Trinidad, British Guiana and the Windward and Leeward Islands, and observers from Jamaica and British Honduras. The conference recommended establishment of a dollar decimal currency, based on the West Indian dollar, for the five eastern colonies. It was also proposed to establish a Regional Currency board, with headquarters in Trini-

dad, composed of one commissioner from each of the five colonies; the board, recommended to begin operations Jan. 1, 1948, would have sole authority to control, issue, and redeem all currency and coins. The Barbadian share in possible surpluses or deficits of the board's operations would be 10%; other shares would be: Trinidad 55%; British Guiana 25%; Windward Islands 6%; Leeward Islands 4%.

Trade and Communications.—Rum exports in 1945 were 1,309,997 gal. (1944: 1,055,479 gal.), most of which went to Great Britain but some to Canada, Newfoundland, Puerto Rico, and the (U.S.) Virgin Islands.

The British West Indian Airways in 1946 began providing weekly plane service to Barbados.

Agriculture.—The estimate of sugar production in 1946 was 120,000 long tons from 40,000 ac. (1945: 119,448 tons from 37,000 ac.)

BIBLIOGRAPHY.—*Foreign Commerce Weekly* (Washington); *West Indies Year Book, 1945*; *Crown Colonist* (London, monthly).
(R. H. FN.)

Barium Minerals. The production of barite in the United States was as shown in the table. Production continued to rise in 1946, the first half exceeding that for the same period of 1945 by 4%, but consumption declined 6%. Decreased demand for drilling mud was not fully offset by increases in other uses.

U.S. Production of Barite, 1939-45

(in thousands of short tons)

	1939	1940	1941	1942	1943	1944	1945

Well drilling . . .	125.6	138.1	154.8	117.4	144.5	277.8	407.9

Canada increased in barite output from 338 tons in 1940 to 118,719 tons in 1944 and 140,198 tons in 1945, mostly in Nova Scotia.

Production figures for Germany during the years of World War II, released in 1946 by the military government authorities, show a decline from a high of 530,000 short tons in 1938, as export markets were closed, and a settling down to a fairly uniform figure of 370,000-380,000 tons for home consumption during 1940-44.

(G. A. Ro.)

Barley. The 1946 barley crop in the United States was estimated by the U.S. department of agriculture at 263,350,000 bu., 3% smaller than the 266,833,000 bu. harvested in 1945 and 12% below the ten-year average of 1935-44 of 289,598,000 bu. The acreage was only 10,061,000 ac. compared with the ten-year average of 12,550,000 ac. The average yield was 25.1 bu. per acre compared with the ten-year average of 22.8 bu. Although the crop was the smallest after 1937, the quality was high. About 49% of the crop was produced in the north central

BARLEY SAMPLES held by Alden Kolb of Cleveland, Wis., which won him the \$500 sweepstakes prize at the Wisconsin state fair in Milwaukee and the title of champion barley grower of Wisconsin for 1946

states where conditions were ideal in 1946 and much of the crop was of the high malting quality. The yield was 30 bu. per acre in California, compared with 20 bu. in North Dakota and 22.5 bu. in South Dakota. The highest yields were reported for Utah, 44 bu. per ac., and Washington 39 bu. The goal of 13,000,000 ac. to produce a crop of about 264,000,000 bu. was proposed for 1946 by the department of agriculture in order to provide feed for livestock. About 90,000,000 bu. was expected to be used for brewing. The price of barley was steady at \$1.02 to \$1.09 per bushel from Jan. 1945 to Jan. 1946, then began to advance reaching \$1.35 in October and \$1.36 in December.

(J. C. Ms.)

Bartlett, Robert Abram (1875-1946), U.S. explorer, was born on Aug. 15 at Brigus, Newfoundland. He studied at Methodist college, St. Johns, and after graduation shipped aboard a trading vessel. At the age of 22, he shipped to the Arctic with Robert Edwin Peary in the "Windward," then commanded by Samuel Bartlett, Robert Bartlett's uncle. Peary later made the younger Bartlett captain of the "Roosevelt," the first ship ever built in the United States for Arctic exploration. He was in command of the "Roosevelt" during Peary's unsuccessful attempt to reach the pole in 1905-06, and again in 1908-09 when on April 6 Peary and five companions reached their goal. He was in command of the "Karluk," flagship of the Stefansson expedition which sailed through the Bering straits, 1913-14, and was caught in an ice jam 15 miles off the mouth of the Colville river. Bartlett and his crew made their way over the ice to Wrangel island. There he left 15 members of his crew, while he and an Eskimo guide crossed to Siberia in search of a rescue party. They returned nine months later to Wrangel island and in Sept. 1915 finally reached Nome, Alaska, with 13 survivors. Bartlett subsequently

engaged in a number of exploratory voyages, and during World War I he was a marine superintendent of the army transport service. He also piloted the Stoll-McCracken expedition to the Aleutians, 1928, and the Greenland Northeast Coast expedition, 1930. He and Commander Donald B. MacMillan received the Peary Polar Expedition medal in 1945. Captain Bartlett died in New York city on April 28.

Baruch, Bernard Mannes (1870—), U.S. financier and government official, was born Aug. 19 in Camden, S.C. After attending City college of New York, he entered the field of finance, and by 1912 he was said to have amassed a fortune estimated variously between \$12,000,000 and \$15,000,000. During World War I he headed the War Industries board and was given what amounted to complete authority over U.S. war production. After the war he went to the Versailles conference as economic adviser to President Woodrow Wilson. Later he returned to private business and resumed his operations in Wall street.

After the outbreak of World War II, Baruch returned to the government as adviser on industrial production to the personal staff of James Byrnes (then Office of War Mobilization director). Appointed by President Harry S. Truman as U.S. delegate to the United Nations atomic energy commission (March 18, 1946), Baruch submitted three months later (June 14) the U.S. proposal for international control of atomic energy. After much wrangling, the commission approved (Dec. 26) by a 10-0 vote (with the soviet union abstaining) the nonpolitical sections of an atomic control report that was largely made up of principles embodied in the original Baruch plan. Baruch resigned from the commission, Jan. 4, 1947, with the statement that he was convinced that the first phase of the struggle to achieve effective world control of atomic energy had been won.

Basalt: see STONE.

Baseball. Freed from wartime restrictions for the first time after Pearl Harbor day, organized baseball in the United States made 1946 the greatest year of renaissance in the long history of the national game.

Nearly 53,000,000 spectators paid to watch the season's contests in the 2 major leagues and the 42 minor leagues, a figure that more than doubled the previous combined high total, which was compiled from the 1945 major and the 1939 minor attendance figures. No comparison could be drawn between the 1946 and the 1945 season in the minor leagues, since only 12 of the latter survived the wartime suspension.

The year's extraordinary figures do not include the unusually large patronage of a great number of pre-season exhibition games. With the major league clubs—and big minors—permitted for the first time in three years to seek southern climes for their spring training activities (the New York Yankees, for instance, going as far afield as the Panama Canal Zone) the appearance of star players in these non-big league sections after a three-year lapse proved a tremendous magnet for the fans.

As an example of this spectator-hunger, the Yankees, on their long exhibition tour, which began in Balboa and ended in Brooklyn with a three-game series against the Dodgers, drew 316,846 paid admissions—far above any other club's training game attendance.

The Yankees, exploited to the full by the dynamic Colonel Larry MacPhail, set the pace in every attendance respect. At the Yankee stadium they drew 2,262,512 paid, the first time in major league annals that the 2,000,000 mark had been reached

or exceeded, while on the road they played to 2,309,029 paid—another all time record.

Five clubs in each major loop—New York, Detroit, Boston, Cleveland and Washington in the American and Brooklyn, Chicago, New York, St. Louis and Philadelphia in the National—each drew more than 1,000,000 paid admissions.

In the National league St. Louis, with its world champion Cardinals, and Philadelphia, with its rejuvenated Phillies, passed the 1,000,000 mark for the first time in the history of the ball parks in which they operate.

The approximate attendance in the minor leagues, with some clubs failing to report, was 33,000,000, the previous high being 18,500,000 in the baseball centennial year of 1939. In the minor leagues, 43 clubs opened the season and 42 completed their schedules, the Mexican National league withdrawing late in May.

At the close of the season 46 minor leagues were lined up for the following year, with several more in the process of organization.

A comparison of the major league attendances for 1944-46 may be found in Table I.

Table I.—Major League Attendance Figures, 1946, 1945 and 1944

The Mexican Invasion.—Early in 1946 the Pasquel brothers, of Mexico, began offering fabulous salaries to star players to jump to the Mexican National league. With a fortune of some \$60,000,000 and allegedly backed by another \$50,000,000, the Pasquels, headed by Jorge, dynamic director of all family enterprises, made rapid inroads on organized baseball.

Most outstanding U.S. players who succumbed to the Mexican golden lure were Vernon Stephens of the St. Louis Browns, Max Lanier, Fred Martin and Lou Klein of the Cardinals, and Mickey Owen and Luis Olmo of the Dodgers, but there were at least two dozen lesser luminaries who also made the jump.

Stephens, star shortstop, recanted and returned to the Browns before the major league season opened on April 16, which was the deadline set by Commissioner Albert B. Chandler for a player to escape being barred. Stephens had signed for five years with the Mexican loop.

Owen, however, who had wavered twice about making the move and finally made it on April 12, suddenly fled Mexico in midsummer. In the United States Owen voiced charges of ill-treatment, including threats of bodily injury, bad food and broken promises. Mickey later appealed to the commissioner for reinstatement but eventually was banned from U.S. organized baseball for five years.

On May 4, in St. Louis, Pete Reiser, star young outfielder of the Dodgers and Stanley Rojek, rookie shortstop, revealed

they had rejected offers from the Mexican league and on May 6 Federal Judge Rubey M. Hulen issued a temporary restraining order enjoining Bernardo Pasquel from "unlawfully interfering" with the Dodgers by persuading Brooklyn players to break their contracts.

On May 3 the New York Yankees had obtained an order from Justice Benjamin F. Schreiber, of the state supreme court, restraining "agents of the Mexican league and a New York sports writer from attempting to induce any Yankee player to repudiate his signed contract." The writer, Rud Rennie, of the *New York Herald Tribune*, later was eliminated from any charges by Justice Julius Miller when the justice granted a temporary injunction.

The Dodger suit was dismissed by Judge Hulen on May 31 and a temporary injunction granted the New York Giants by Justice William Hecht on May 12 was being held in abeyance as the year ended.

On May 17 the Pasquels and their league, through Attorney Jerome Hess, in New York supreme court, brought a counter action, charging U.S. player contracts were "monopolistic, inequitable, unconscionable and against the public policy" and that players who signed them were held "in peonage for life."

Yankee lawyers, including Louis Carroll, National league counsel, were denied a motion before Justice Carroll B. Walter in late November to "strike out these affirmative defenses." But Judge Walter voiced the opinion that "some restraints" on players are necessary and indicated the contracts were neither monopolistic nor illegal.

The Yankee case was set for trial on Jan. 27 of 1947, but was expected to be delayed another month or two by appeals on other questions affecting the action.

Jorge Pasquel filed suit in Springfield, Mo., against Owen, who had signed his Mexican contract in St. Louis, for \$127,500, the amount encompassing breach of contract and monies paid the Dodger catcher for which he did not render service.

An interlude in the whole Mexican affair was a visit to the Pasquel brothers in Mexico City in June by Samuel Breadon, president-owner of the St. Louis Cardinals, one of the chief victims of the Mexican so-called player raids. Breadon returned praising the Pasquels via the press. One result of this was a \$5,000 fine against Breadon by Commissioner Chandler because the St. Louis club owner failed to report personally on his visit. The fine later was rescinded after Breadon talked with the commissioner.

Baseball Union.—Already harassed by the Mexican invasion the major leaguers were posed another problem when, on April 16 in Boston, Robert Murphy, lawyer and former Harvard athlete, registered the American Baseball guild as a labour organization in Suffolk county.

At the same time Murphy announced his guild had "substantial memberships" in the majors and that several "big name" players were working as organizers.

Murphy, former National Labor Relations board examiner, outlined his program as seeking freedom of contract, players to receive part of purchase price when sold, salary and other disputes to be settled by collective bargaining, and provisions made for security, insurance, bonuses and other matters. Said Murphy then:

"Organized baseball no longer can rule with the iron hand of an absolute dictator. Now it must deal with organized baseball players in the form of the American Baseball guild. The guild's purpose is to right the injustices of professional baseball and to give a square deal to the players, the men who make possible big dividends and high salaries for stockholders and club executives."

The guild moves followed rapidly, with the "crisis" coming in Pittsburgh in early June after Murphy had notified the management of the Pirates that an "overwhelming majority" of

their players were union members and wished to discuss collective bargaining.

The first showdown came on the night of June 5 when a night game with the Dodgers at Forbes field was delayed while Pirate players deliberated striking because the management had not agreed to a collective bargaining election. Finally they voted unanimously to play the game but against playing the following Friday unless their point had been gained.

But on that Friday, June 7, the Pirates voted 20 to 16 in a secret meeting that lasted two hours and five minutes not to strike. Then Murphy filed charges that the Pirate management had formed a "company union" to break the strike, which on June 11 were ordered dismissed by the NLRB.

The Pennsylvania Labor Relations board on Aug. 7 ordered an election held Aug. 20 and on that date the Pirates rejected the guild in baseball's first collective bargaining election by a 15-3 vote.

Players Win Concessions.—Although major league owners had breathed a sigh of relief at the guild rejection in Pittsburgh, their ensuing actions showed an awareness of players' rights which had been only slightly recognized before the twin advent of the guild and the Mexican invasion.

On July 18 in Chicago, at a joint meeting of major league committee members, it was voted in what was termed "a precedent-shattering move" to give major league players a voice in the drafting of a new uniform players' contract.

Players promptly named various men to confer with league executives, these player committees later being whittled down to Fred (Dixie) Walker of the Dodgers and Johnny Murphy of the Yankees as authorized negotiators for players in both leagues.

The players did not win any revision or elimination of the much-discussed ten-day clause—they did not seek any revision on the reserve clause—but they won a minimum salary of \$4,500 for any player retained on a major league club after the "cutting down" date, one month after the season opens. They were given \$25 a week for personal expenses during spring training when they are not on salary.

They can not be given a salary cut if sent to a minor league club in mid-season. If traded or sold to another club during the season the player will be allowed moving expenses up to \$500. If a player has been twice claimed on waivers and recalled the claiming club will get him on the third call. Nor can any club seek waivers on more than seven players at one time.

The owners co-operated on the player pension plan by agreeing to pay \$250 per man into the fund and to give the money from world series broadcasts and net proceeds of All Star games to the fund. The pension idea is that within five years after the plan actually becomes operative any major league player with ten years of service at the age of 45 may collect \$100 a month, with proportionately smaller pensions for fewer seasons of play.

Since the major leagues announced they could account for only \$395,000 of the fund, the pension plan faced the new year with the problem unsolved. A total of \$675,000 annually would be required to make the fund solvent, thus the financial angle appeared to present a baffling problem.

Ownership, Personnel Changes.—Two major league clubs found new owners during the year, these shifts, incidentally, bringing the radio and movie stars, Bob Hope and Bing Crosby, officially into the major league picture. Bill Veeck, former minor league operator at Milwaukee and son of the former head of the Chicago Cubs, bought the Cleveland American league franchise, with Hope as one of several associates.

Frank McKinney, former owner of the Indianapolis American association club, in a group including Crosby, purchased the

Pittsburgh National league club from the Dreyfuss family, which had owned the club when the franchise originally was at Louisville, Ky. In neither case was the cash consideration revealed.

McKinney dropped Frank Frisch as Pirate manager and, at the close of the season, named Billy Herman, former Cub, Dodger and Brave infielder, to succeed the Fordham Flash. McKinney named Roy Hamey, American association president, as his general manager, which in turn resulted in Frank Lane, Kansas City business manager, becoming the A.A. head.

George M. Trautman left his post as general manager of the Detroit Tigers to become president of the National Association of Professional Baseball Leagues (the minors) when Judge William G. Bramham retired from active duty because of ill health. Bramham was named for life as consultant to the president at an annual \$10,000 salary.

Bramham's secretary, L. H. Addington, and his promotional director, Arthur Ehlers, also resigned, the latter joining the Philadelphia Athletics as farm director.

Managerial changes came to three American league clubs and two in the National loop. Herold (Muddy) Ruel quit as special aide to Commissioner Chandler to take over the Browns; Ted Lyons, veteran pitcher, replaced Jimmy Dykes as pilot of the Chicago White Sox; Stanley (Bucky) Harris became the manager of the Yankees; Johnny Neun succeeded Bill McKechnie with the Cincinnati Reds and Herman took over the Pirates.

Joseph Vincent McCarthy, who directed the Yankees so successfully for two decades, found himself not seeing eye to eye with his new boss, MacPhail, and resigned on May 24. Bill Dickey, star catcher and Yankee veteran, was named to succeed McCarthy, but Dickey, too, resigned on Sept. 13, Neun taking over the job only until the close of the season. On Oct. 1 Neun became manager of the Reds and on Nov. 5 Harris, who had joined the Yankees Sept. 9 as a front office executive, succumbed to MacPhail's urging and accepted the post as Yankee field manager for 1947. Another interim manager was Zack Taylor, who, when Sewell resigned on Aug. 31, piloted the Browns until the season's end, when Ruel was named as the 1947 leader.

Billy Evans, former sports writer and American league umpire, returned to the major leagues as general manager of Detroit after he had been permitted to dissolve a five-year contract as president of the Southern association minor loop.

The Pennant Races.—Joe Cronin's Boston Red Sox, reinforced by the return from the services of such stars as Ted Williams, Bobby Doerr, Johnny Pesky and Tex Hughson, made themselves hard to catch from opening day. Two weeks from the start the Sox were two games in the lead and were one and a half games in front on May 5.

But that was the lowest point of the campaign. The next day they moved three games in front by winning a doubleheader from the Browns and never lost their margin. After the All Star game interim they moved from a seven and one-half game advantage to the point where they clinched the pennant on Friday, Sept. 13, with a 1-0 victory in Cleveland.

Williams won the game with a home run inside the big Municipal stadium when, with the entire Indian defense shifted far to the right, he sliced a drive into left field and rounded the bases before the ball could be retrieved.

The National league race was different, the pennant winner not being decided until the first post-season play-off in the older league's history had been held. The St. Louis Cardinals emerged the champions, beating the Brooklyn Dodgers in two straight games of a scheduled three-game play-off series. They took the first game in St. Louis, 4-2, behind the eight-hit pitching of Howie Pollet, then went to Brooklyn and two days later, Oct. 3,

downed the Dodgers, 8-4. Manager Leo Durocher used five pitchers in the first encounter and six in the final in a desperate effort to avert defeat.

These two teams had finished on the final day of the season, Sunday, Sept. 29, in an exact tie, each having won 96 and lost 58 games. Both lost on this date, Mort Cooper, former Cardinal ace, blanking the Brooks for the Boston Braves, 4-0, on four hits while the Chicago Cubs were pounding five of Manager Eddie Dyer's pitchers for an 8-3 triumph, with southpaw Johnny Schmitz the winning pitcher.

The Dodgers and Cards were indicated as the chief contenders early in the race. Each lost the opening game, then won seven straight. The Cards moved ahead by splitting a doubleheader while the Dodgers lost two and thereafter the contenders were never far apart until the Dodgers moved into a seven and one-half game lead on July 2.

The Brooks moved into the west on July 11 and by the time they had finished in Chicago and St. Louis a five-game lead had been dissipated to a game and a half. The Cards were a half game in front on July 18, then the two teams ranged from a tie to another slight lead for Brooklyn until another tie in late August held for four straight days.

St. Louis went ahead at the end of the month by winning three straight from New York while the Dodgers were losing two to the Cubs and stayed there until they went into another tie on Sept. 27, with the Cubs beating the Cards while Brooklyn was idle. Both won on the penultimate day to carry the dead-lock to the finish.

Two no-hit games were turned in, one by each league. Ed Head, Louisiana youth, originally a left-hander but who became a right-handed pitcher because of a series of accidents to his left arm, pitched the first one in Brooklyn on Tuesday, April 23, against the Braves, the Dodgers winning for him, 5-0.

Bobby Feller, the Cleveland fireball artist, duplicated the feat seven days later in New York's Yankee stadium when he held the Bronx Bombers hitless and the Indians won for him by the slim margin of 1-0. It was Feller's second no-hitter, as he had held the White Sox hitless on opening day in 1940.

Feller, incidentally, added to a brilliant season's record by striking out 348 batsmen, breaking a mark set by Rube Waddell, Athletics, in 1904. He also appeared in 48 games, pitched 371 innings and 36 complete games, all tops for his league. He tied Hal Newhouser, Detroit, with 26 triumphs, hurled 2 one-hitters, 2 three-hitters, 4 four-hitters and 10 shutouts.

The final standings of the clubs in the two league races follow:

*Includes play-off after close of regular season.

All Star Game.—This contest, only inter-league mid-season game, was played in Fenway park, Boston, July 9, and won by

Above: **FAST DOUBLE PLAY** in the 1946 World Series. The play was on an infield roller, fielded by the third baseman, and relayed to second and to first base. In the picture above, St. Louis Cardinals' second baseman Red Schoendienst, having forced Boston Red Sox runner Johnny Pesky and loosed the throw to first base, is about to be bumped by Pesky

Left: **SCHOENDIENST**, leapfrogging Pesky, rides his shoulders momentarily before coming down head first

Below: **AT FIRST BASE**, Stan Musial of the Cardinals is about to receive the throw from second, retiring the batter, Red Sox Dom DiMaggio, and completing the double play. The action occurred during the sixth game of the series at St. Louis, Oct. 13

the American league by the decisive score of 12-0, worst beating the National had taken in losing 9 of 13 played. Feller, Newhouser and Jack Kramer, the latter of St. Louis, combined to hurl the shutout, Feller allowing two hits, Newhouser one and Kramer none in three innings each. Charley Keller, Yankees, hit one home run off Claude Passeau, Cubs, while Ted Williams hit a pair, one off Kirby Higbe, Dodgers, and the other off the Pirate pitcher Rip Sewell's famous "blooper ball."

The World Series.—Getting into baseball's headline event for the first time in 28 years the Boston Red Sox, under Manager Joe Cronin, lost it to the St. Louis Cardinals, led by their freshman pilot, Eddie Dyer, in the limit of seven games. Six times in nine series since 1926 the Red Birds won top honours, thrice coming from behind to win the sixth and seventh contests, winning five times after dropping the opener, and going into a class by themselves by triumphing four times in a limit-game series.

Thus the Cardinals contributed largely to reducing American league superiority, the junior loop having won 26 of 43 Blue ribbon battles from the series' inception in 1903 when a Boston Red Sox team became the first world champions.

The Red Sox of 1946, pronounced favourites in the betting, never were behind until the final game, the Cards moving up to tie the series three times and stay in the running.

Scores of the seven games, the first two in Sportsman's park, St. Louis, the next three in Fenway park, Boston, and the final pair again in St. Louis, were: Red Sox 3, Cards 2 (10 innings); Cards 3, Red Sox 0; Red Sox 4, Cards 0; Cards 12, Red Sox 3; Red Sox 6, Cards 3; Cards 4, Red Sox 1; and Cards 4, Red Sox 3.

Harry (The Cat) Brecheen, by winning three games (the final one in relief), tied a record that had stood from 1920 and also became the first lefthanded hurler in series history to attain that distinction. Brecheen was the gilt-edged hero of the whole affair.

Rudy York, big Alabama first baseman, won the first game for the Sox when, in the tenth inning with two out and none on base, he hammered a home run into the left field bleachers. His victim was Howard Pollet, southpaw, who went the distance under the severe handicap of torn back muscles and with his torso wound in tape. Earl Johnson, holding the Cards scoreless in the last two innings after the starter, Tex Hughson, had retired for a pinch hitter, was credited with the victory.

The Sox scored first in the second inning when York was hit by a pitched ball, Bobby Doerr walked and Pinky Higgins, Sox third baseman, lined a scoring single to right centre. The Cards first tied it in the sixth when Red Schoendienst scratched a single off Doerr's glove, advanced on Terry Moore's infield out and rode home on Stan Musial's solid double off the right field wall.

St. Louis went ahead in the eighth after two were out. Whitey Kurowski lined a single to left and scored when Joe Garagiola's fly to centre was lost in the sun by Dom Di Maggio and went for a double. Garagiola was out trying to reach third before Kurowski crossed the plate but Umpire Lee Ballanfant ruled that Higgins had obstructed Whitey as he was rounding third base and allowed the run.

The Sox tied it again in the ninth. With one out, Higgins scratched a bounding hit over Martin Marion's head and two of three pinch hitters came through. Glen Russell singled to centre, Roy Partee fanned, and Tom McBride slashed a single to left for the run.

Brecheen turned in a well-nigh perfect pitching performance to even the series the next day, shutting out the Red Sox on four singles, which came in the first, fourth, fifth and ninth innings. The Cards assailed Mickey Harris, Boston southpaw, for one run in the third inning on Del Rice's double to left and Brecheen's single to right, then added two more in the fifth,

both unearned because of a wild throw by Higgins. Singles by Rice and Moore, plus Higgins' misplay, produced the tallies.

The third game, on Oct. 9 in Boston, brought a classic job by Dave (Boo) Ferriss, sophomore star right-hander, as he blanked the Cards on six hits. York again was the big gun, clinching the game in the first inning with a three-run homer off little Murry Dickson, Card righthander. Johnny Pesky had singled, Ted Williams had been purposely passed with two out, and the count was three-and-two on Rudy when he connected. Rudy singled in the eighth off Ted Wilks and scored the fourth run on a fumble by Schoendienst after Doerr had crashed a double off the left field wall.

Back came the Cards in the fourth meeting to pound six pitchers for 20 hits (which tied a 20-year-old record), good for a dozen runs, while George Munger, an army lieutenant as late as August, was able to hold the Sox to only three runs on nine hits. One of the blows was a home run by Doerr, which came with two out and Di Maggio aboard via Marion's error.

There was no change in the see-saw pattern the next day, the Sox winning again behind the excellent pitching of big Joe Dobson, who allowed only four hits and no earned runs—although the Cards scored three times. Pollet essayed another start but didn't survive the first inning, and Alpha Brazle, redheaded southpaw who relieved Howie, allowed five of the six Sox tallies and was charged with the loss. Leon Culberson's first homer of the series was one of the seven hits off Brazle and came in the sixth with none on base. Two of three runs scored in the seventh resulted from a wild throw by Marion.

After a one-day lapse for travelling back to St. Louis the crucial sixth game ran its successful Cardinal course with Brecheen's seven-hit southpawing evening the series for the last time. Cronin sent Harris back for a second start but Mickey was knocked out in the third inning on five hits, one a two-bagger by Schoendienst. These blows brought three runs and the Cards got another in the eighth off Johnson on a long double by Marion that scored Harry Walker all the way from first base, where he had arrived on a force play. The Sox broke through Brecheen's mastery only once, and again it was the dangerous York. Rudy opened the seventh with a triple off the centre field wall, on which the great Moore barely missed a sensational catch—and scored on Doerr's long fly to Walker.

The seventh and deciding game saw Dickson starting once more and the Red Sox getting away to a one-run lead in the first inning on singles by Wally Moses and Pesky and Di Maggio's scoring fly to Enos Slaughter. Whitey Kurowski's double to left centre, an infield out and Walker's scoring liner to Williams put Dickson back on even terms with Ferriss.

In the fifth Walker's single, Dickson's double and two more singles by Schoendienst and Moore put the Cards two runs ahead and drove Ferriss away to be replaced by Dobson. Dickson faltered in the eighth when Russell's pinch single and George Metkovich's pinch double came with none out and Dyer brought Brecheen in to put out the fire. The Cat did nobly by fanning Wally Moses and getting Pesky on a short fly to Slaughter but Di Maggio crashed a double off the right field wall to tie the score at 3-3.

Brecheen disposed of Williams (later to be voted "the flop of the series") on a pop fly and the Cards came up for their winning eighth, an inning which made heroes of Slaughter, Walker and Brecheen and a "goat" of Pesky. Slaughter opened on Bob Klinger, Cronin's third pitcher of the game, with a line single to centre. Kurowski tried to sacrifice and popped to Klinger, while Rice made the second out by flying short to Williams. Then Walker sent a line drive to left centre and the speedy Slaughter set sail for pay dirt.

Culberson, playing centre field because of Di Maggio's injury,

fielded the ball cleanly enough and relayed it to Pesky, out on the grass in short centre field. Johnny assumed Slaughter would not attempt to score but the daring Enos never hesitated, rounding third base at full speed. Pesky made two motions to throw, in his confusion, then his throw to Partee at the plate was too late—and that was the game and series.

Brecheen had to pitch out of trouble in the ninth, as York and Doerr opened on him with singles. But Higgins' attempted sacrifice forced Doerr, York going to third, Partee fouled to Musial and McBride, a first-game hero, grounded to Schoendienst, who tossed to Marion for the force-out that ended everything.

Because of the small capacity of both ball parks the players' pool was rather low, the individual winning shares being only \$3,742.33 and the loser's \$2,059.99. The total was reduced further when the \$175,000 paid for the radio broadcast rights was voted into the major league pension fund.

Individual Achievements.—Outfielders won the third award of the Kenesaw Mountain Landis Memorial trophies for 1946. Through the votes of two 24-man committees of the Baseball Writers association of America, Ted Williams, of the Boston Red Sox, and Stan Musial, of the St. Louis Cardinals, were selected as the most valuable players in their respective leagues.

Williams had close competition from Hal Newhouser, Detroit southpaw who won the 1944 and 1945 awards, having 224 points to Hal's 197. Bobby Doerr and his keystone teammate, Johnny Pesky, drew 158 and 141 votes, respectively; Mickey Vernon, Washington first baseman, 134, and Bobby Feller, Cleveland pitching ace, 105.

But Musial was far ahead of his field in the National league, drawing 319 points, as compared with 159 for Dixie Walker, Brooklyn, his closest competitor. Enos Slaughter's total was 144 and his Cardinal teammate, Howie Pollett, polled 116 points. Musial drew 22 first place votes, Slaughter drawing 2 as the only other player to be picked first.

Williams won only nine first place votes, while Doerr was next with five. Six other American leaguers drew from one to three first place ballots, an unusual distribution.

President Leo MacDonell, of the *Detroit Times*, was chairman of selection committees, which were made up of three Association members from each major league city, this number, of course, being increased to six in those cities that house a club in both leagues.

Musial was the older league's batting champion for 1946 with a mark of .365, while Mickey Vernon, Washington, won similar

honours in the American league with a .353 average. Hank Greenberg, Detroit veteran, who once came closest to Babe Ruth's record, was the major home run king with 44. Williams was runner-up with 38 home run blows.

Ralph Kiner, Pittsburgh rookie outfielder, hit 23 homers to lead the National, followed by Big John Mize, New York, with 22. Enos Slaughter drove in 130 runs to top both leagues and Greenberg was second with 127.

Pitching honours in the National went to Pollet, of the Cardinals, whose earned run average of 2.10 was tops. His staff mate, Murry Dickson, led in winning percentage with .714, winning 15 and losing only 6. In the American league Hal Newhouser's e.r.a. of 1.94 gave him that leadership for the second straight year, while Dave Ferriss, Red Sox, was the percentage leader with 25 and 6 for a mark of .806.

The permanent Hall of Fame committee early in April added the following to the Cooperstown, N.Y., roll: Frank Chance, Jack Chesbro, Ed Delehanty, Hugh Duffy, Johnny Evers, Clark Griffith, Thomas F. McCarthy, Joe Tinker, Rube Waddell, Ed Walsh and Iron Man Joe McGinnity. The committee also instituted a roll of honour for the hall, on which the names of a score or more of other players were inscribed.

The Minor Leagues.—Judge William G. Bramham, retiring head of the minors, in his valedictory at the Los Angeles meetings Dec. 5, warned against gambling in baseball. Specifically, Bramham cited the case of one player being barred for life, another under investigation and, "in another case a whole club roster is involved." Commissioner A. B. Chandler, at first saying it wasn't his job to "police the minors," later said he would "move in" to clean up the situation.

A new major-minor agreement was drafted (the majors also met in Los Angeles), with the minors gaining some concessions and revisions, notably the creation of a new class of "bonus players." This would presumably deter major league clubs from paying large cash amounts to free agents to sign with them, since the status of such players would remain fixed.

No such player could be optioned to a minor league club—a necessary move in a rookie's development into major league calibre—without first having waivers asked, which could not be withdrawn, and the player always would be subject to unrestricted draft.

In the minors' pennant races 21 clubs that finished first in the season race also won the play-off. All in the three triple-A leagues—Louisville in the American association, Montreal in the International and San Francisco in the Pacific Coast league, were double winners. So, too, was Atlanta in the Southern association and Scranton in the Eastern league. One club in Class B, Charlotte in the Tri-State loop, won both, while there were eight Class C and seven Class D clubs who were double winners.

Basketball. Oklahoma A. and M. once again dominated the collegiate basketball scenes during the 1945-46 season, retaining the National Collegiate Athletic association championship with a 43-40 victory over North Carolina in the tournament final at New York. Oklahoma A. and M., led by seven-foot Robert Kurkland, won 31 games and lost 2. Only Kentucky, winner of the national invitation tourney and victorious in 28 out of 30 games, presented a challenge to Oklahoma A. and M. Kentucky captured the invitation title with a 46-45 victory over Rhode Island in the final.

In keeping with the general increase in sports attendance, basketball drew record crowds in all sectors of the nation. College double headers and tournaments at Madison Square Garden, New York, attracted 628,718, while the Ohio State v. Northwestern attraction at the Chicago stadium drew a record

PLAYER OF THE OSHKOSH ALL-STARS professional basketball team about to attempt a shot at the basket after eluding a player of the American Gears team in a game at Chicago stadium on April 3, 1946

collegiate crowd of 22,822 fans.

Dartmouth won its eighth title in nine years by regaining first place in the Eastern league with seven victories and one defeat. New York university and St. John's divided honours in the Metropolitan conference. Both Louisiana State and Kentucky wound up undefeated in the Southeastern league, but Kentucky won the tournament championship. Duke won the Southern conference tournament, although outranked by North Carolina in the standings.

Ohio State won the Western conference title, defeating Northwestern, 53 to 46, in the season finale which drew the record single crowd. Notre Dame (17-4) and DePaul (19-5) experienced excellent seasons in the middle west. Kansas won the Big Six conference with a record of 10 victories and no defeats. Oklahoma A. and M. won the Missouri Valley conference with an unblemished record in 12 league games.

Baylor topped the southwest with 11 victories and 1 defeat in conference play, while Wyoming won the Big Seven title. The University of Idaho won its first title after 1923 in taking the Pacific coast championship.

Individual scoring honours for 1945-46 were chiefly garnered by Kurkland, who set an all-time scoring record in major competition with 58 points against St. Louis university. The Oklahoma A. and M. centre scored 643 points during the season, third highest on record and first among major college players. George Mikan, six-foot, nine-inch centre from DePaul, proved the standout of the midwest, setting a career-total of 1,870 points, two more than any other player in the modern history of major college basketball.

Phillips "66" of Bartlesville, Okla., outlasted a field of 64 teams to win its fourth straight American Athletic union championship. The Oilers stopped the San Diego, Calif., Dons in the final, 45 to 34. The Nashville, Tenn., Goldblumes, who won the

title in 1944 and 1945 under a different sponsorship, emerged as women's A.A.U. champion with a 26-20 final victory over Des Moines, Ia.

On the professional front, Bobby McDermott's Fort Wayne, Ind., Zollners wound up with the world championship with their triumph in the professional tournament at Chicago. The Rochester, N.Y., Royals won the National league title, while the Baltimore, Md., Bullets topped the American league.

During the late summer a new professional league, the Basketball Association of America, organized on a 12-team basis. As a result, there were more than 30 major professional teams operating in three leagues at the close of 1946.

The College All-Stars defeated Fort Wayne, 56 to 53, in overtime to start the 1946-47 season.

*A number lacking a decimal is an estimate.

War demand necessitated increased supplies of bauxite, not only for aluminum, but also for other uses, especially abrasives and chemicals. The largest increases were made in British Guiana, Hungary, Surinam and the United States. Total output increased nearly fourfold. Of the peak output of 1943, the United States produced 45%, as compared with 12% in 1937 and 9% in 1939.

United States.—The peak of demand for bauxite brought out about 8,000,000 tons of U.S. production in 1943, with a drop of more than half in each of the succeeding 2 years, as demand settled back toward normal levels. Small as was the 1945 output as compared with 1943, it was three times greater than the prewar output, and nearly double the top figure attained during World War I. The salient features of the bauxite industry in the United States are outlined in Table II.

Table II.—Data of Bauxite Industry in the U.S., 1939-45

Although production was slow in building up in the early years of World War II, and supply did not catch up with demand until 1943, the program as a whole more than fulfilled requirements, as not only were current demands met, but at the end of 1945 surplus stocks were in excess of 4,000,000 tons, not counting the amount that had been used in making similar emergency stocks of aluminum. (G. A. Ro.)

Beans, Dry. The 1946 United States crop of dry beans was estimated by the U.S. department of agriculture at 15,797,000 bags of 100 lb. each. This compares with a crop of 13,038,000 bags in 1945 and a ten-year average of 16,408,000 bags in 1935-44. The acreage for harvest in 1946 was 1,629,000 ac., slightly above 1945 and below the ten-year average of 1,879,000 ac. The yield in 1946 was large, 977 lb. per acre compared with 881 lb. in 1945 and a ten-year average of 873 lb. The Michigan crop was better than in 1945 but below average for that state. California had a smaller crop than in 1945 and much below the average. Idaho harvested a crop above the average and New York also had an above-average crop.

U.S. Production of Dry Beans in Leading States, 1946 and 1945
(In 100-lb. bags)

State	1946	1945	State	1946	1945
Michigan . . .	3,841,000	2,977,000	New York . . .	1,428,000	714,000
California . . .	3,587,000	3,559,000	Wyoming . . .	1,305,000	1,075,000
Idaho . . .	2,142,000	1,725,000	Nebraska . . .	992,000	730,000
Colorado . . .	1,618,000	1,572,000	Montana . . .	322,000	234,000

Prices of beans were supported at 90% of parity during the first half of the year. In August the average farm price was \$6.63 per 100 lb. which was about the same as a year earlier, by September the price advanced to \$8.49 and in December to a top of \$12.70 per bushel. Of the 1945 crop more than 10,000,000 bags were exported under lend-lease and U.N.R.R.A. while civilians consumed only 1,275,000 bags.

(J. C. Ms.)

Bechuanaland Protectorate: see BRITISH SOUTH AFRICAN PROTECTORATES.

Beef: see MEAT.

Beekeeping. The honey crop of 1946 in the United States declined 10% from 1945 to 209,058,000 lb. compared with 233,070,000 lb. produced in 1945 and an average of about 150,000,000 lb.

The reduced crop in 1946 was due to lower yields per colony of bees, 36.4 lb. in 1946, 42.7 in 1945 and an average of 41.7 lb. in 1940-44. The number of colonies was estimated at 5,787,000 in 1946 which was 6% more than the 5,460,000 colonies reported in 1945. While the yield in the west, south and Atlantic states was larger than a year before, reductions in the central west brought down the total crop. The leading honey producing states were California, 23,511,000 lb.; Minnesota, 20,332,000 lb.; Florida, 15,280,000 lb.; Iowa, 14,336,000 lb.; Texas, 10,920,000 lb.; Ohio, 9,856,000 lb. and Indiana 9,000,000 lb. Wisconsin had a crop of only 7,420,000 lb. compared with 14,140,000 lb. in 1945. The yield per colony was highest in

Nebraska at 108 lb. Florida followed with 80 lb. In California the yield per colony increased from 34 lb. in 1945 to 51 lb. in 1946. Stocks of honey were about 10% smaller than a year earlier in the early fall. Honey prices were decontrolled on Sept. 27 and advanced promptly.

(J. C. Ms.)

Beer: see BREWING AND BEER.

Beery, Noah, Sr. (1884-1946), U.S. actor, was born on Jan. 17 in Kansas City, Mo. He became a newsboy in Kansas City, sold candy in a local theatre and then became an actor. Melodrama was his forte but his success was only moderate and he went to Los Angeles, Calif., where he picked up an occasional job on the sets of the silent movies. His huge physique and his ability to twist his face into ferocious scowls made him suitable for "heavy" roles and soon he won recognition as a top-flight villain in the old time "tear-jerkers." He specialized in portrayals of brutal, fiendish louts and cinema audiences throughout the country trembled as he beat his wife or tortured helpless children. Beery went to Broadway in late 1944 and played the part of Boss Tweed in Michael Todd's production of *Up in Central Park*. He died in Hollywood on April 1.

Belgian Colonial Empire. The Belgian colonial empire consists of the colony of Congo in central Africa and the adjacent mandated territories of Ruanda and Urundi. The accompanying table gives material relative to all the territories administered by Belgium (q.v.). Total area: 923,270 sq.mi.; pop. (est. Jan. 1, 1946): 14,336,000 of whom 33,787 were whites (23,506 Belgians). Chief towns with their white pop. only (est. Jan. 1, 1946): Léopoldville (cap. 5,385), Elisabethville (5,244), Stanleyville (1,271). Governor general 1946: Pierre Ryckmans.

History.—The great problem which faced the Belgian Congo in 1946 lay in the transition from a wartime administration to a peacetime one. For more than four years the colony strained hard to produce the various raw materials of which the Allies were in urgent need. This was not accomplished without a profound upheaval in the economic and social fields. It was thus that to compensate for the loss of Malaya and the East Indies the unprofitable production of wild rubber increased from 419 short tons in 1942 to 10,560 in 1944, and the output of tin which had been 1,994 tons in 1938 reached 11,925 in 1943. As for the number of natives employed as workmen, it went on mounting at the expense of the rural communities. Whereas in 1934 there were about 338,000, in 1944 there were many more than

691,000. The disposition, too, of the native working-class suffered a change causing them to assert their claims with ever-greater insistence. On various occasions local disturbances broke out. On April 6, 1946, a regulation came into force establishing native trade councils and local committees of native workmen. Four days later the government gave the natives the right to form unions and declare strikes. As a result, official unions were created and in May 1946 Henri Pauwels laid the foundations of Christian trade unionism in the Congo. The colonial ministry, for its part, took a lively interest in the living conditions of the natives and in the means for co-ordinating efforts directed towards social betterment. It sent a mission to the Congo with the task of studying on the spot current problems and particularly conditions as they affect the development of native women.

As far as the colonist element itself was concerned, a commission composed of delegates from all parts of the Congo met in Brussels during July and Aug. 1946. It put forward a vast scheme affecting land, revenue and social administrative development, with the object of encouraging Belgian emigration to the colony. It was expected that in 1947 the government would begin to carry out this scheme.

In Oct. 1946 undenominational education was inaugurated in the Congo under official patronage. Three cultural institutes were set up—Léopoldville, Elisabethville and Costermansville. This very costly innovation met with a bad reception in Catholic circles which were in favour of a religious education such as had always been provided by the missions.

The outstanding political event of the year 1946 was the announcement of the departure of the governor general, Pierre Ryckmans. On July 5, 1946, at Léopoldville, Ryckmans delivered an important speech, regarded as his political testament. "Africa has reached a turning-point in her destiny," he said; "the days of colonial aggrandizement are past; the great days of colonial development lie ahead." On Dec. 31 Eugène Jungers, former governor of Ruanda-Urundi, was appointed successor to Ryckmans.

(G-H. D.)

Belgian Congo: *see* BELGIAN COLONIAL EMPIRE.

Belgium. A kingdom of western Europe. Area: 11,775 sq.mi.; pop. (May 31, 1946): 8,355,232. Chief towns (pop. 1945): Brussels (cap., 1,282,438); Antwerp (767,619); Liège (534,725); Ghent (435,278); Hasselt (207,907); Mons (247,812); Namur (209,080); Bruges (197,431). Languages: Dutch, French and German; religion: Christian (mainly Roman Catholic). Ruler: King Leopold III, Prince Charles (*q.v.*) regent. Prime minister: Camille Huysmans (appointed Aug. 17, 1946).

History.—On Jan. 9, 1946, Achille van Acker announced the dissolution of the legislature, declaring that "differences of opinion concerning essential aspects of my policy had become manifest in the innermost circles of the government." The electoral campaign was very short and took place without any noteworthy incident. On Feb. 17, 2,724,796 voters went to the polls, the right to vote having been taken away from 322,000 Belgians accused of want of patriotism. The results for the chamber of representatives were as follows:

	Christian-Socialists	Liberals	Socialists	Communists	Democratic Union
Number of votes:	1,006,293	211,143	746,738	300,099	51,095
Seats	92	17	69	23	1

Owing to the laws governing the composition of the upper house, the Christian-Socialist majority was more impressive in the senate than in the chamber: out of 167 seats, the Christian-Socialist party won 83. According to the rules of parliamentary practice, the regent entrusted Auguste de Schrijver with the

formation of a government; but the leader of the Christian-Socialist party failed before the solid front presented by the Socialists and Communists. Prince Charles then turned to Paul-Henri Spaak, who, on March 13, formed a government composed of Socialist members and technicians from outside parliament. A week later the chamber refused its support and M. Spaak and his government were forced to resign. After a renewed and fruitless attempt on the part of M. De Schrijver, the prince regent called upon the services of Van Acker, who, on March 31, formed a cabinet comprising six Socialists, six Liberals, four Communists and three technicians from outside parliament. In his ministerial declaration, M. van Acker admitted that the question concerning the king still remained undecided and required a solution; he announced, furthermore, "three battles to be waged—that of coal, that of prices and that of exports."

On May 23, at the end of a session of the National Labour conference, the government decided to "freeze" wages and institute an all-round reduction in prices of 10%. These measures put a noticeable brake on the alarming rise in the cost of living, but their effect was hindered by trades union demands and by the dearth of certain commodities. On Nov. 24 the municipal elections took place. Compared with the results of the general elections of Feb. 17, the Liberals improved their position and the Christian-Socialists marked new successes, as opposed to the Socialists, who just maintained their seats, and the Communists, who lost many. Four days later the senate rejected the budget of war pensions presented by the government. Although put in minority the latter refused to resign and presented the budget for the second time. In protest, the members of the opposition left the house, but on Dec. 3 they returned and the quarrel was settled.

On July 9 Van Acker's government was defeated in the senate, after it had been proved that the minister of justice had intervened in favour of a company accused of economic collaboration and had endeavoured to influence the judicial authorities. A prolonged crisis ensued. It came to an end on Aug. 2 with the formation of a government presided over by Camille Huysmans, which was virtually the same as the preceding one. The Christian Socialist party remained in opposition, chiefly on account of the question relating to the king.

The second half of 1946 was marked by a slowing down in economic recovery. The coal and metallurgical industries were sluggish, as compared with the first quarter of the year. As for the cost of living, it rose so rapidly as even to exceed prices current before May 23.

As regards foreign policy, Belgium associated itself wholeheartedly with the decisions adopted by the United Nations. Paul-Henri Spaak, minister for foreign affairs, was elected president of its first general assembly. The relations between Belgium and Spain were marked by numerous diplomatic incidents brought about over the subject of Léon Degrelle. After refusing for nearly 15 months to hand over the Rexist traitor to Belgium, the Spanish government allowed him to escape mysteriously on Aug. 23. The matter was brought to the notice of the United Nations organization.

The agreements signed in Brussels on May 24 between Belgium and Holland, providing for an increase in reciprocal trade between the two countries, marked a decisive step along the road leading towards that economic union between Holland, Belgium and Luxembourg decided upon in London on Sept. 5, 1944.

Education.—1938: primary schools 8,712, scholars, 955,038; higher schools 273, scholars 86,279; universities (1937–38) 4, students 10,776.

Banking and Finance.—Revenue (est. 1946) \$1,328,000,000; expenditure (est. 1946) \$1,603,000,000. Public debt (Aug. 31, 1946) \$8,662,054,000. Gold reserve (Aug. 31, 1946) \$765,000,-

MONARCHISTS, carrying poster of King Leopold III in a demonstration at Wilyryk, Belgium, during 1946, demanded his recall to the throne from virtual exile

ooo. Exchange rate (average 1946) 1 franc = 2.29 U.S. cents.

Trade and Communication.—External trade (merchandise): imports (1945) \$314,390,000; exports (1945) \$90,981,700. Communication: roads suitable for motor traffic (1945) 6,433 mi.; railways open to traffic, main (1945) 3,089 mi.; airways (1938), distance travelled 1,457,050 mi., passenger mileage 8,255,980 mi., baggage mileage 172,799 ton mi., mail mileage 86,434 ton mi., newspapers 57,875 ton mi. Shipping (July 1, 1939) 450,199 gross tons, under construction (March 31, 1946) 104,940 tons. Motor vehicles licensed (1944) 53,823; wireless receiving sets (1938) 1,062,000; telephone subscribers, local (1938) 287,323.

Agriculture.—The activity of the black market made the drawing up of valid statistics for agriculture impossible. Returns made on Jan. 1, 1946, of cultivated land under cereals suitable for bread provided the following acreage figures: winter wheat 340,215; spelt 18,409; maslin (mixed crop of wheat and rye) 4,947; rye 259,134. Production in 1945 was estimated as follows: (in short tons) butter 17,900; cheese 6,280; potatoes 1,340,000; sugar beets 976,000; mangels 4,517,000; turnips and swedes 61,000; fodder carrots 42,000; (in U.S. bushels) wheat 11,381,000; rye 5,935,000; barley 5,196,000; oats 25,293,000; maslin 161,000; linseed 544,000; flax 32,000.

Manufacturing.—Industry and labour: industrial production (1946) general 57 (1929 = 100); textiles (monthly average, May 1946) 8,681 short tons. Unemployment (July 1946) 43,881.

Mineral Production.—Monthly average (in short tons): (July 1946) cast iron 213,400; crude steel 216,700; (June 1946) copper 7,536; lead 337; zinc 7,195; (Aug. 1946) coal 2,019,600. (See also BELGIAN COLONIAL EMPIRE.) (G-H. D.)

Benefactions: see DONATIONS AND BEQUESTS.

Benton, William (1900—), U.S. assistant secretary of state, was born April 1 in Minneapolis, Minn. He was graduated from Shattuck Military academy, Fairbault, Minn., and received the bachelor's degree from Yale university, New Haven, Conn., in 1921. He entered the advertising agency business in New York in 1922. In 1929, in partnership with Chester Bowles, he founded the Benton and Bowles agency,

which rose rapidly to become one of the most successful in the advertising business. He resigned the active direction of the agency in 1935 and in 1942 sold his remaining interest in the firm.

Benton became vice-president of the University of Chicago in 1937, devoting himself to the development of radio and classroom motion pictures as instruments of education. At Benton's instance the university acquired Encyclopaedia Britannica, Inc., in 1943, of which he became chairman of the board. He launched Britannica into the classroom motion picture field and served as board chairman of Encyclopædia Britannica Films Inc. In collaboration with Paul Hoffman he founded (and served as vice-chairman of the board of trustees for) the Committee for Economic Development, which instituted studies and plans for reaching and maintaining high levels of employment and productivity in the postwar period.

Benton was appointed assistant secretary of state, in charge of public affairs, on Sept. 1, 1945. He resigned from all operating responsibilities outside the department of state. His special responsibilities within the department included: (1) the domestic information work of the department; (2) a projected program of international information and cultural exchanges, on a bilateral basis; and (3) U.S. participation in the United Nations Educational, Scientific and Cultural Organization.

On Jan. 1, 1946, Benton's program under the second of these was crystallized in opening of the Office of International Information and Cultural Affairs, which was charged with helping to project to the peoples of other nations "a full and fair picture of American life, and of the aims and policies of the United States Government." During the year this office carried on short wave broadcasts in 24 languages; exhibited documentary films for audiences of many millions abroad; provided full texts of official U.S. statements relating to foreign policy to foreign editors by wireless, and by mail background material on U.S. life; stimulated the exchange of students, scholars and scientists; and maintained small information staffs, and U.S. information libraries, in 62 countries. Congress appropriated \$19,284,000 for this work for fiscal 1948, and \$5,820,000 for cultural and scientific exchanges with the other American republics.

In collaboration with the war department, Benton appointed education missions to Japan and to Germany which recom-

mended steps to democratize the educational systems of those countries.

Congress approved U.S. participation in the United Nations Educational, Scientific and Cultural organization in June, and Benton headed the U.S. delegation to the first general conference of the organization at Paris in November and December.

Bentonite. Sales of bentonite in the United States rose from 546,768 short tons in 1944 to 573,998 tons in 1945, an increase of 7% in quantity, while value rose only 5%. Most of the increase in output came from South Dakota, Wyoming and California; these states produced 69% of the total in 1945, against 67% in 1944. Drilling muds for oil wells took 28% of the 1945 total, foundry facings 28% and oil filtering and decolorizing 25%. (See FULLER'S EARTH; MICA.) (G. A. Ro.)

Bequests, Philanthropic: see DONATIONS AND BEQUESTS.

Berlin. Residence of the Hohenzollern electors and kings from 1442 to 1918, capital of the German reich from 1871 to 1945, Berlin is the largest and most important city of Germany. It was the centre of Germany's rail, highway and air lines, of its political and financial life, and of its system of cheap water transportation by rivers and canals. From June 1945, it has been the seat of the Allied Control council which supervises the administration of occupied Germany. The city has an area of 332 sq.mi., and a population (census of Oct. 29, 1946) of 3,170,000, or about 1,000,000 less than in 1939.

Berlin is divided into four sectors, each under the control of one of the principal Allies: the Russian sector in the centre and east, mainly industrial, is the largest (pop. 1,170,000); the U.S. sector in the southwest, largely residential, is the most attractive (976,000); the British in the west has attractive lakes and woods (603,000); and the French in the northwest is the smallest (421,000). On Oct. 20, 1946, elections were held in all sectors for the choice of a city council and cabinet which was then

entrusted with a large part of the city government. As a result of World War II—bombs, artillery and fire—about 80% of the residential buildings were damaged and 20% rendered uninhabitable. (See also GERMANY.) (S. B. F.)

Bermuda. An archipelago and a British crown colony, consisting of about 360 small islands about 580 mi. east of Cape Hatteras, North Carolina. Area: 19.3 sq.mi.; pop. (1945 est.): 35,000. The capital is Hamilton (pop., 1945 est., 3,500); the only other town of importance is St. George (pop., 1939, 2,665). Only about 16 of the islands are inhabited. Bermuda has a representative government including a legislative council of nine members (three officials and six nominated non-officials) and a house of assembly of 36 members elected equally by the nine parishes. Governors in 1946: William Addis (acting), until Jan. 23; then Adm. Sir Ralph Leatham.

History.—The traditionally heavy Bermudan tourist traffic revived considerably in the season of 1945-46, with a resultant stimulus to all forms of activity in the islands. Hamilton was the scene of an eight-power radio-cable conference in the closing weeks of 1945, which, on Dec. 4, 1945, signed an executive pact cutting international communications rates and taking other significant steps. A civil aviation conference at Hamilton agreed on Jan. 15, 1946, on the mutual commercial use of nine military airfields built by the United States in British possessions in the North Atlantic and the Caribbean; one of these was Kindley field, the principal installation in Bermuda. Because of dissatisfaction with the handling of various domestic problems, Dr. E. F. Gordon, president of the Bermuda Workers' association, announced on March 4 that he would petition for the appointment of a royal investigating commission. Adm. Sir Ralph Leatham in May assumed the post of governor, to which he had been appointed in January. The United States and British governments on Sept. 19 reaffirmed the Bermuda aviation agreement, although the U.S. senate commerce committee on April 16 had approved a resolution to the effect that the pact was illegal because not negotiated in treaty form. An empire parliamentary assembly conference met at Hamilton during the week of June 10; four representatives each from the U.S. house of representatives and senate attended the sessions. Gov. Leatham in October proposed that within 10 years universal suffrage for those over 25 years of age should be established; he also attacked inflationary tendencies. The house of assembly in its response to the message replied sharply.

On Aug. 2, Bermuda definitively ended its 38-year-old ban against motor vehicles. A break in the traditional prohibition had been made during World War II and the executive council on Dec. 31, 1945, voted to end the ban, but much public opinion against the step crystallized in the early months of 1946. The final legislation imposed severe restrictions on the horsepower, type and speed of automobiles and prescribed regulations in such a way as to favour importation of British makes. By September, 827 motor vehicles had been licensed.

Education.—Schools are almost entirely private but receive increasing governmental support. At the beginning of 1944, 28 schools enrolled 5,160 pupils. The total expenditure on education in 1943 was £73,449.

Finance.—The monetary unit is the pound sterling, linked to the pound in London and in the British West Indian possessions. Estimated 1945 revenues and expenditures were respectively £782,100 and £838,123. The debt at the beginning of 1944 was £75,000. The treasury reported a deficit of £60,000 on June 30, 1946, but by Sept. 30 the net deficit was reported as reduced to £48,257. During World War II the colonial government accumulated an emergency reserve of about £250,000; by Sept. 30, 1946, total reserves were reported as £327,042.

BARTER CENTRE in Berlin which was organized in 1946 to combat the black market

Trade and Communication.—The chief imports are clothing and textiles, foodstuffs, and hardware and furnishings; the principal exports are lily bulbs, green vegetables and potatoes. Total 1945 imports were valued at £2,444,470 (1944: £2,465,676); of that amount the United States provided £1,601,866, the United Kingdom £163,589 and Canada £599,034. The U.S. is customarily the chief buyer of Bermudan products.

Bermuda has about 25 mi. of narrow-gauge railway and 120 mi. of highway. The Bermuda Railway company at the end of 1945 offered the entire mileage and its rolling stock to the colonial government for £115,000, claiming it faced an annual loss of £35,000 to £40,000 and had an accumulated loss of £600,000 from the time it began operations in 1931. The government bought out the railway company at that figure, ownership passing on Jan. 25, 1946. The house of assembly on July 15 granted the Canadian government a four-year monopoly on a Canada-Bermuda air service.

Beryllium. The output of beryllium ores in the United States rose from 95 short tons in 1939 to 388 tons in 1944, and declined abruptly to 39 tons in 1945. Of the 7-year total of 1,426 tons, 1,096 tons came from South Dakota. The bulk of the supply was from imports, mainly from Brazil, Argentina, India and Australia, increasing from 810 tons in 1940 to 4,840 tons in 1943, but dropping back to 3,115 tons in 1944 and 1,201 tons in 1945. The United States absorbed about three-quarters of the world output during the war years.

Betting and Gambling. The amount of money involved in world-wide gambling during 1946 may have approached or even equalled the estimated \$15,000,000,000 which was bet in all forms of gambling in 1945. Nevertheless, gambling was not so general among wage-earners in the middle income groups, and if the money bet remained at a peak amount it was because of a general increase in the amounts bet by a diminished number of bettors.

In both the United States and the United Kingdom, the only accurate measure of the volume of betting was the totalizators which register legalized bets on horse and dog races. In the United States, there was little betting on dog races, but the sum of bets placed through pari-mutuel machines at horse-race tracks was approximately \$1,900,000,000, by far the highest figure in history. In 1945 it had been \$1,325,000,000. The reason for the increase, however, was partly that there were more race meetings in states which permit and tax pari-mutuel betting. In 1946 there were 2,500 days of racing, in 1945 only 1,850 days. Therefore in 1945 a greater proportion of the betting was done through bookmakers.

In Great Britain, greyhound racing vied with horse racing for popularity; but while the amount bet was estimated to be about the same as in 1945 (£140,000,000), observers reported that in the last six months of 1946 there was a noticeable decline.

Strikes, a lower level of employment and somewhat lower average earnings, combined with a general feeling of insecurity as to the economic future, were accountable for the lessened attendance at U.S. gambling houses by the small bettor who risked at most a few dollars. Some gambling houses closed, and others handled far less money than they had in the war years. Bingo remained the game most popular among small bettors, but did not attract quite so many players, nor those so regu-

PATRONS of the gambling ship "Lux," formerly the navy vessel "Bunker Hill," at a roulette table as the luxurious vessel rode at anchor off Long Beach, Calif., in Aug. 1946. On Sept. 17, the U.S. department of justice impounded the ship under the admiralty laws

larly, as it had in the war years.

Betting on sporting contests increased. Bookmakers in the United States were deluged with bets on the winners of contests in baseball, football, basketball, hockey and other games popular in that country. Proprietors of football and baseball pools took in more than \$75,000,000 in the United States, and in Great Britain the football pools were so generally played that they nearly replaced straight betting on the results of contests between two teams.

In the United States, betting on amateur and professional sports became so general, and the amounts wagered so high, that professional gamblers organized the booking of such bets. Representatives of the gamblers "scouted" the principal teams and reported on their chances of winning, as a handicapper does in horse racing. In some cases the interest of professional gamblers cast a cloud over the contests themselves: The president of the National Association of Professional Baseball leagues, W. G. Bramham, on resigning from that office in 1946, asserted that players had been bribed to lose games. In the final match of the 1946 season in the National (Professional) Football league, a player was declared ineligible because he had been approached by a representative of professional gamblers with an offer of payment if he played so as to make his team lose the game. At the end of 1946, the heads of the University of Notre Dame and the U.S. Military academy at West Point, whose football teams had played the most widely publicized games of the past two decades, announced a suspension of the series; and while no specific reason was given, it was assumed to be the number of professional gamblers whose interest had been attracted to that annual game. In 1946, the game between West Point and Notre Dame had ended in a scoreless tie, which had produced the greatest profit of football history for bookmakers; for, in a game between teams so evenly matched, the bookmaker usually permits the bettor to select either team and bet that it will win by one point. In these circumstances, the bookmakers keep all money bet with them if the game ends in a tie.

Gambling on card games, never very great in proportion to

the gambling on sporting contests or on dice and mechanical games played in gambling houses, was no greater in 1946 than it had been in 1945. Stakes in bridge and poker games increased slightly, a normal consequence of inflation in the amount of currency in circulation.

On the continent, the casino at Monte Carlo and some of the other casinos were open and were well patronized, the play frequently being in large sums. In soviet Russia, the wartime practice of government-operated lotteries as a form of taxation was continued and there was normal betting on horse races, sporting contests and card games.

Beveridge Report: see SOCIAL SECURITY.

Bevin, Ernest (1881–), British labour leader and cabinet minister, was born in Winsford, Somerset, England, the son of an agricultural labourer. Bevin, who became general secretary of the Transport and General Workers' union, played a leading part in the general strike of 1926, which was broken by Winston Churchill. In 1937 he was appointed chairman of the General Council of Trades Union congress. In May 1940, Churchill named him minister of labour and national service, and on Oct. 3, 1940, Bevin was promoted to the war cabinet. After the Labourite victory at the polls, July 26, 1945, Bevin was appointed foreign secretary by Prime Minister Clement Attlee (July 27).

Bevin was a major participant in the meetings of the Council of Foreign Ministers in London (Sept.–Oct. 1945) and at the Moscow meetings (Dec. 1945). Throughout 1945 and during most of 1946, Bevin was sharply critical of Soviet foreign policy. At the London sessions of the U.N. security council, he attacked Soviet activities in Iran, and nettled by Andrei Vishinsky's charges that the presence of British troops in Greece and Java endangered world peace and security, Bevin asserted (Feb. 1, 1946) that the "incessant propaganda from Moscow against the British Commonwealth" constituted the "real menace" to peace. Bevin also attended the meetings of the council of foreign ministers in Paris and the subsequent peace conference in that city. Generally, the British foreign secretary closely aligned his policy with that of his U.S. colleague Secretary James F. Byrnes. Later opposition developed within the British trades union and the Labour party against his making common cause with "Wall street imperialists." Putting his foreign policy to the test before commons, Bevin won a 353 to 0 vote of confidence (Nov. 18); however, many Labourites abstained from voting. After his return to England in December from the sessions of the United Nations and council of foreign ministers in New York, Bevin declared (Dec. 22), that Britain does not "tie herself" to anyone except with regard to her obligations under the U.N. charter and extends "the hand of friendship" to all.

Bicycling: see CYCLING.

Bidault, Georges (1899–), French statesman, was born on Oct. 5 in Moulins, France. He served in the French army during World War I from 1917 to 1919. After the war, he resumed his studies at the Sorbonne university, graduating with high honours, and later taught history in secondary schools. In 1932, he and members of a left wing Catholic group founded the Catholic newspaper *L'Aube*, with Bidault as foreign editor and columnist. At the outbreak of World War II, he joined the army with the rank of sergeant. He was taken prisoner and held in the reich until 1941. On returning to France, he joined the underground and in 1943 became president of the National Council of Resistance. A fort-

night after the liberation of Paris, he was named foreign minister (Sept. 9, 1944), in Charles de Gaulle's provisional government and accompanied De Gaulle to Moscow where they signed (Dec. 10), the Franco-Soviet pact of mutual alliance. Bidault headed the French delegation that attended the United Nations conference in San Francisco in (April–June) 1945 and represented France at the first council of foreign ministers in London (Sept.–Oct. 1945), and at the U.N. sessions in London in early 1946.

At the Paris sessions of the council of foreign ministers in the spring and summer of 1946 and at the following 21-nation peace conference, Bidault generally endorsed the Anglo-U.S. policies, although he frequently dissented with James Byrnes and Vyacheslav Molotov.

After the elections of June 2, 1946, he was elected provisional president by the constituent assembly. He also became premier, June 24, thus holding concurrently the posts of president, premier and foreign minister.

He resigned after the Communist victory at the polls in Nov. 1946 and was succeeded by Léon Blum, Dec. 12, 1946. He returned to the post of foreign minister (Jan. 22, 1947) in the government of Paul Ramadier.

Bikini Island. Approximately 20 coral reef islands in the Ralik chain of the Marshall Islands, in 11° 30' N. lat. and 165° 30' E. long., and about 190 mi. E. of Eniwetok and 250 mi. N.W. of Kwajalein.

Bikini was the site of the atomic bomb tests conducted by the United States navy in July 1946. The first scientists arrived in February in preparation for "Operation Crossroads." Prior to the test 92 target ships ranging from battleships to submarines were anchored in the 25 mi. long lagoon. For the purposes of the experiment 4,800 animals were placed on the ships. A task force of 1,000 vessels and 42,500 men participated. On July 1 a United States army bomber took off from Eniwetok and dropped an atomic bomb set to explode close to the surface of the water. A second test in which an atomic bomb was exploded under water took place on July 25.

The 161 natives, of mixed Melanesian-Polynesian stock, were removed to Rongerik Atoll 130 mi. to the east in February. Though Rongerik, previously uninhabited, appeared to have all the advantages of Bikini, the exiled natives expressed a desire to return to their home island in Oct. 1946. The request was refused because of the presence of radioactivity on Bikini. (See also ATOMIC ENERGY.)

(P. A. V.)

NATIVES MOVING THEIR BELONGINGS from Bikini atoll, prior to the atomic bomb tests in July 1946, to an LST which carried them to Rongerik atoll, a new home 130 mi. away

Billiards. The pocket billiards championship of the world, which had been in his possession in 1942, returned to Irving Crane, 33-year-old cue expert from Livonia, N.Y., in the final month of 1946. Crane finished first in an eight-man field that competed in the round-robin title tournament at Philadelphia, Pa., winning six of his seven matches against the outstanding players in the sport. Runner-up to Crane was the defending titleholder, Willie Mosconi of Barrington, N.J. Mosconi won five and lost two. However, the erstwhile champion romped off with the high run honours, a string of 125, and the best game prize, a 2-inning performance.

Pocket billiards dominated the cue game throughout the year, as Welker Cochran of San Francisco retained the world's three-cushion diadem through idleness. Prior to the pockets tourney, Mosconi and Crane engaged in a transcontinental challenge match for Willie's crown. Starting at Philadelphia and terminating at Chicago, the tour wound up with Mosconi still champion as the result of an 8,727-7,508 victory in 86 games.

(L. EF.)

Biochemistry. **Nutrition, Vitamins.**—The structural formula and synthesis of one form of folic acid, the liver *Lactobacillus casei* factor, was reported. Called pteroylglutamic acid, it contains a 2-amino-4-hydroxy-6-methylpteridine, para-aminobenzoic acid and glutamic acid. The synthetic compound caused remission in cases of human macrocytic anaemias, especially pernicious anaemia and sprue; in chicks it prevented perosis and was necessary for feathering. Other forms of folic acid contain this basic unit bound to protein or to additional glutamic residues: the fermentation factor has two, the yeast factor has six additional glutamic acid units. Although these conjugated forms are equally effective for bacterial growth, they are less effective in the treatment of pernicious anaemia (and other human anaemias) and the disease seems to be characterized by an inability to liberate the pteroylglutamic acid from its combinations. These observations provide for the first time a role for para-aminobenzoic acid in human metabolism.

Niacin or Tryptophan.—Either is completely and separately active in preventing poor growth of rats on corn diets low in niacin. Addition of tryptophan to the diet of rats increases urinary niacin excretion and therefore causes niacin synthesis; also the addition of niacin to the diet improves the utilization of tryptophan. The existence of a positive pellagragenic factor (aside from niacin and tryptophan deficiency) was indicated by the induction of niacin deficiency by feeding 3-acetylpyridine, and later by the separation of a pellagragenic factor from corn. Indole acetic acid, a plant hormone known to be present in corn, was found to have such an antiniacin action.

Studies on the intravenous infusion of amino acids to supply the protein requirement showed that in dogs the natural amino acids are much better tolerated (without vomiting) than mixtures containing racemic amino acids; that the addition of glycine improves the tolerance to racemic mixtures and that *dl*-methionine (in addition to glutamic and aspartic acids previously reported) is especially poorly tolerated.

That mixtures of amino acids do not have the same nutritive value as an equivalent weight of protein was indicated by the better weight gains of rats receiving a diet of the latter and the improvement in growth rate caused by the inclusion of 5% of protein (but not the acid hydrolysed protein) with diets containing amino acid mixtures. Streptogenin is the name given to a bacterial growth factor found in partial (trypsin) hydrolyses of certain protein (for example casein and fibrin, but not egg white), which stimulates the growth of rats whose protein requirement is furnished only by amino acids. Since streptogenin

activity is completely lost on acid hydrolysis, the active material is thought to be a peptide.

Several new growth factors were described or isolated: a heat-labile stimulating factor for *Streptococcus faecalis* (previously shown to be necessary for maintenance of weight and blood of monkeys), a heat-labile rat-growth-stimulating factor from liver, a fat-soluble heat-stable guinea pig antistiffness factor from cane juice, an animal protein factor (not streptogenin) necessary for growth of chicks and *L. casei* and a chick growth factor from cow manure.

Metabolism.—With the aid of isotopes as tracers the following biological conversions were demonstrated: glycine from *L*-serine, with loss of the latter's beta-carbon; creatine from the amidine group of arginine in the rat, but not the pigeon; glucose from inositol; protoporphyrin of haemoglobin from glycine. After the feeding of N^{15} containing glycine, the N^{15} content of the haeme of the blood haemoglobin was found to remain high and constant for many weeks and then suddenly (within a few days) to fall to the original value. This indicates that the erythrocyte has a definite life span (which experiments in humans indicate to be 127 days) and that the protoporphyrin of haemoglobin is not used again in haemoglobin synthesis. In vitro, in the presence of rat liver slices, the conversion of acetate to cholesterol (dependent on oxygen and intact cells) and the acetylation of natural amino acids were observed. A study of the distribution of C^{13} in uric acid following the administration to pigeons of various C^{13} containing compounds showed a diversified list of precursors for this purine: CO_2 is the precursor of carbon 6; carbons 2 and 8 (in the urea groups) are derived from the carboxyl carbon of acetate; carbon 4 from the carboxyl groups of either lactate or glycine and carbon 5 from the alpha (or beta) carbon of lactate. Later it was found that C^{13} of formate fed to pigeons is recovered in carbons 2 and 8 of uric acid but not in any other carbons. This shows that in the pigeon, formate may be derived from the carboxyl group of acetate, but not by reduction of CO_2 .

Competitive Inhibition.—Many studies were reported on the interference with nutrition by compounds structurally similar to vitamins or essential amino acids or interference with enzyme action by substances structurally related to coenzymes. To be classed as competitive inhibition the action of the inhibitor must be prevented by adequate quantities of a chemically related natural substance. In the case of inhibition of bacterial growth the term antibacterial index is used to mean the ratio of the molar concentration of inhibitor to that of metabolite which is necessary for maximum inhibition. Usually antibacterial indexes are considerably greater than 1 (from 10 to 300) and indicate a preferential affinity for the natural metabolite. Following are a few of the many examples reported in 1946: the inhibition of yeast growth by gamma-hexachlorocyclohexane, reversed by inositol; the inhibition of *D*-amino acid oxidase by competition with the flavin-adenine-dinucleotides of the antimetabolites atabrine and quinidine; the inhibition of growth of *Escherichia coli* by sodium propionate and its reversal by beta-alanine; the competitive action of seryl-glycyl-aspartic acid and seryl-glycyl-glutamic acid, the former causing wilting of tomatoes and inhibiting growth of *L. casei* (streptogenin effect), and the latter preventing these actions.

Mechanism of Insulin Action.—The first reaction in the utilization of glucose (whether for oxidation, glycolysis or glycogen formation) is the conversion to glucose-6-phosphate by the action of the enzyme hexokinase. When studied in extracts of rat muscle, this hexokinase activity was found to be inhibited by anterior pituitary extract, and this inhibition was found to be overcome by the addition of insulin. Extracts of muscles of rats made diabetic with alloxan show a depressed hexokinase activity, which is restored by addition of insulin. Adrenal cortical extracts do not themselves depress hexokinase activity, but they increase the inhibition caused by the anterior pituitary material. Diabetic rats injected with insulin have muscles which show normal hexokinase activity. These experiments indicated that the action of insulin is to promote the hexokinase reaction by preventing the latter's inhibition by the anterior pituitary hormone, which inhibition is in turn augmented by the cortical hormone. (See also PHYSIOLOGY; VITAMINS.)

Biology: see BOTANY; GENETICS; MARINE BIOLOGY; PHYSIOLOGY; ZOOLOGY.

Birth Control. The year 1946 marked the 25th anniversary of the Planned Parenthood Federation of America, Inc. (formerly the Birth Control Federation of America). The year was distinguished by advances in the field of religious acceptance and by international recognition of family planning as an aid in solving population problems related to world peace.

International.—Speaking before the International Health conference of the United Nations, Dr. Djamil Pasha Tutunji, health director of Trans-Jordan, declared that birth control is as important to world peace as the control of the atom bomb.

The first postwar international sex conference, attended by representatives of eight countries, was held in Stockholm, Sweden. Delegates from the unoccupied countries, where planned parenthood programs had been curtailed but not abolished, reported development of a three-fold program of child-spacing, treatment of infertility and education for marriage, in line with work of the U.S. group. Visiting physicians from India, China, Japan, New Zealand, Spain, Brazil, Argentina, South Africa and Italy all reported growing awareness of the importance of planned parenthood in an over-all health program.

Religion.—Recognizing that planned parenthood is one way to combat the country's growing divorce, abortion and juvenile delinquency rates, the National Clergymen's Advisory committee of the Planned Parenthood federation passed a resolution seeking the establishment of planned parenthood services in hospitals, public health clinics and other agencies where the service should be given. The resolution, signed by 3,200 Protestant and Jewish religious leaders, was given nation-wide publicity by the press. The united action of the clergymen in favour of planned parenthood completed the year's program which opened with an address by Bishop G. Bromley Oxnam, president of the Federal Council of the Churches of Christ in America, before the 25th annual dinner.

Medical and Public Health.—The New York Academy of Medicine conducted a survey of contraceptive services in New York city hospitals and found that only 5 of the city's 89 hospitals had contraceptive clinics. The mistaken belief that birth control is illegal was believed to keep many patients from seeking medical advice on child-spacing from out-patient departments which they attended for other medical help. The New York academy report recommended that contraceptive information be made available when it was medically indicated.

The addition of Virginia and Mississippi to the states which include planned parenthood in their public health services brought the total number of such states to eight.

Press and Radio.—Fifty-six articles making favourable mention of planned parenthood appeared during the year in popular and technical magazines. Both the United Press and the Associated Press wire services carried the story of the clergymen's resolution, and in many communities newspaper editors augmented the original story with statements from local clergymen whose names appeared among the 3,200 signers.

Radio's attitude toward planned parenthood underwent a noticeable change during 1946. Bishop Oxnam's address broadcast over the network of the Columbia Broadcasting system was the most frank discussion of the religious significance of birth control ever heard on a network. The National Broadcasting company gave the federation network time for a round-table discussion of "Birth—By Choice or Chance." Participants, who discussed the religious, medical and social aspects

of planned parenthood were: Dr. Guy Emery Sipler, editor of *The Churchman*; Dr. Janet Fowler Nelson, newly appointed consultant on education for marriage and family living, for the federation; and Dr. Alan F. Guttmacher, associate professor of obstetrics, Johns Hopkins medical school. The program was transcribed and copies made available to planned parenthood groups for rebroadcast.

The first series of planned parenthood programs was broadcast in the spring over WFAS, White Plains, N.Y. Scheduled originally as a 13-week series, it was extended to 20 weeks, and the entire series was repeated over the same station in the fall. Scripts of this series were made available to all planned-parenthood leagues and committees.

Education.—In addition to its extensive literature on child spacing, infertility, marriage counselling and population, the federation published two new pamphlets dealing with venereal disease and juvenile delinquency. *The Story of Two Families*, produced in co-operation with the Institute for Venereal Disease Education of North Carolina, pointed out in popular cartoon style the relationship between venereal disease and parenthood. *The Roots of Delinquency* stressed the fact that most juvenile delinquency began at home and was traceable in a large measure to irresponsible parents.

Fund Raising.—Preparations were made for the first nationwide campaign for \$2,000,000 to open in Feb. 1947. A portion of the money was to be used for research which it was hoped would lead to the development of a simple, inexpensive contraceptive and add to current knowledge of the treatment of infertility. The federation also hoped to expand its current program and establish new clinics which would place medically reliable methods of contraception within the reach of all married women regardless of geographical location or economic status.

Organization.—The Planned Parenthood federation was the national agency and clearing house for 38 state leagues and more than 200 affiliated local committees. There were in 1946 about 600 planned parenthood centres in hospitals, public health clinics and extramural clinics operated by volunteer committees. (See also BIRTH STATISTICS.) (M. SR.)

Birth Statistics. In 1946, the first full year of peace, there was an appreciable increase in births over 1945 for the United States, Canada, and England and Wales. The provisional birth rate for the United States for the first eleven months of 1946 was 16% greater than that for the corresponding period of 1945. This gain was not evenly distributed over 1946. The first four months actually had lower birth rates than the same months of 1945, but the following months saw rapidly increasing gains over the like months of the previous year; the provisional birth rate for Nov. 1946, namely 28.8 per 1,000, was 52% greater than that for Nov. 1945. The upward trend in the birth rate during 1946 may be closely associated with the rapid upswing in marriages consequent to demobilization of the armed forces after World War II. Total births for 1946, which were more than 3,350,000, included unregistered births; it was estimated that around 3,180,000 births were registered. This greatly exceeded the 2,735,456 registered in the United States in 1945, the latest year of complete record; the birth rate for that year was 19.6 per 1,000 population.

Canada, like the United States, also experienced a marked gain in births during 1946 over 1945, according to reports from cities of 10,000 or more inhabitants; reports covering the first ten months of both years indicate a 14% gain. In Canada, the period of rapid gain began with April, a month earlier than in the United States. In 1945, the latest year of complete record, 288,398 births were reported in Canada, with a birth rate of 23.8 per 1,000 population. Provisional reports from England

BIRTH STATISTICS do not mean much to these children. But posed in top hats and little else, they added an appropriate effect to the chart illustrating the acute shortage during 1946 of cotton textiles used for diapers

to 29, undoubtedly the result of the withdrawal of men of these ages for overseas service; all other ages showed increases. From 1943 to 1944, decreases in reproduction rates were experienced by fathers of all ages under 35; the continuing increases at the higher ages were attributed to the favourable economic opportunities, resulting from wartime industry, for these older men to increase their families. The age-specific changes in the reproduction rates of women corresponded closely to those for men.

In 1944, the latest year of complete record for the United States, the rate of births among women according to age was as follows: ages 15 to 19 years, 51 births per 1,000 women; at ages 20 to 24, the rate was 142; ages 25 to 29, 132; ages 30 to 34, 92; ages 35 to 39, 52; ages 40 to 44, 15. The rates at ages under 35 in 1944 were lower than those in 1943, while at the later ages they were higher.

Within the female reproductive ages from 10 to 54 years, there were 60.2 births per 1,000 women in 1944. Of these, 20.3 per 1,000 were first births, 15.9 second births, 9.2 third births, 5.0 fourth births, and 8.6 births of fifth or higher orders. The rate of first and second births in 1944 was lower than in 1943, while those for higher orders were practically identical in the two years.

Considered with regard to race, among the white population of the United States in 1944, there were 19.8 births per 1,000 total persons of all ages. Among Negroes, the rate was 23.7 per 1,000; for the Indians it was 28.5.

The rate of illegitimate births in the white population of the United States reached a high point in 1944 when there were 1.20 such births per 1,000 females of ages 10 to 54; in 1943, the rate was only 1.05 per 1,000; this increase was concentrated largely among women of ages 20 to 29 years. Among the Negroes, there were 11.37 illegitimate births per 1,000 women of ages 10 to 54 in 1944; there had been little change in this rate from 1941. Practically 2% of total white births are reported as illegitimate, in contrast to 17% among the Negro births.

The proportion of births attended by a physician in a hospital in the United States rose rapidly, the figure for 1945 being 78.8%. In 1944, 75.6% of all births were so attended, as compared with 55.8% in 1940 and 36.9% in 1935. On the other hand, there was a marked decline in the proportion of births attended by a physician outside a hospital, from 50.6% in 1935 to only 17.7% in 1944. There was likewise a drop in the proportion of births attended by a midwife, from 10.7% in 1935 to 6.4% in 1944. In the latter year, of the white births, 81.0% were attended by a physician in a hospital, 16.9% by a physician elsewhere, 1.9% by a midwife, while the balance were not specified; in contrast, the corresponding figures for Negro births were, respectively, 37.0%, 23.1% and 39.0%. The situation in regard to attendance by a physician at birth was particularly poor among the Negroes in the south Atlantic and south central states.

In the United States, some births fail to be registered with local authorities. On the basis of a test conducted in connection with the census of 1940, it was found that 98.5% of the births occurring in institutions were registered, while of those not occurring in institutions 86.1% were registered. ("Vital Statistics"—Special Reports, Vol. 23, No. 8.) Because of the increasing proportion of births occurring in institutions, there was a corresponding increase in the proportion of births that were registered. It was estimated ("Vital Statistics"—Special Reports, Vol. 23, No. 10) that this proportion increased from 90.5% in 1935 to 94.1% in 1944; for the white population, the rise was from 92.5% to 96.0%, while for the Negroes it rose from 78.7% to 82.7%. The percentage of completeness in registration in 1944 for white births was estimated to range from 90% in the east south central states to 99.2% in the New

and Wales, covering London and the great towns for the first eleven months of 1946, showed a 26% gain over the like period of 1945. For England and Wales as a whole, 684,273 births were reported during 1945, the birth rate being 16.1 per 1,000 population.

In a study, "Some Effects of Famine on the Population of Greece" (*The Milbank Memorial Fund Quarterly*, July 1946), V. G. Valaoras traced the course of the number of births each month in Athens and Piraeus over the war period from 1940 to 1945. The war in Greece started in Oct. 1940. The experience studied showed a rapid fall in the number of births during 1941 beginning with April, when the country was occupied. At the same time, deaths began to rise because of famine conditions, so that from May forward, there was an excess of deaths over births. This situation lasted for two years, through March 1943. In his discussion, the author states that, "The decrease in the number of births during the famine period is attributed not only to the numerous miscarriages and abortions observed during that time, but mostly to a physiological sterility which perhaps affected both parents but was most evident in women. Menstruation was temporarily suspended in more than 70% of adult females."

A survey of wartime changes in age-specific reproduction rates in the United States (*Statistical Bulletin of the Metropolitan Life Insurance Company*, July 1946) showed that the first definite increase occurred from 1940 to 1941 among young fathers of ages 20 to 29; this age group was among the first affected by the draft for military service. From 1941 to 1942 there were marked increases in the rates for fathers at all ages, the advance being relatively most rapid at ages 15 to 19 and becoming progressively smaller with advance in age. From 1942 to 1943, there was a decrease in the reproduction rate among men of ages 20

England states; for Negro births, the range is from 74.7% in the west south central states to 97.9% in the New England states. On the basis of these estimates, it is found that there were 2,969,186 births in the United States in 1944, in place of the recorded figure of 2,794,800.

A comparison of age-specific reproduction rates for white women in the United States with those for the women of Canada in 1941 ("Statistical Bulletin," Sept. 1946), showed that the latter had the higher rates at all ages after 20 years; further, the peak in the rates comes at ages 20 to 24 years for women of the United States, while for Canadian women it comes five years later, at ages 25 to 29. Even at the peak age for American women, 20 to 24 years, Canadian women had a higher reproduction rate, the excess amounting to 3%. Lastly, the decline in the rates with advance in age is much less rapid for Canadian women than for women of the U.S. At age 30 to 34 years, the rate for Canadian women exceeded that for women of the U.S. by 51%, and at ages 40 to 44, the excess amounted to 137%. (See also CENSUS DATA, 1946.)

Bismuth. United States, Peru, Canada and Mexico are, in order of importance, the chief producers of bismuth, accounting for 90%–95% of the total output. U.S. production was not reported, but has ranged from 500 to 1,000 tons annually. For others the 1944 outputs (with 1945 in parentheses) are as follows, in short tons: Canada 62 (105), Mexico 182 (178), Peru 459 (341); world total 1,320 (1,210).

(G. A. Ro.)

Black Markets. The term black market brings to many minds a picture of back-alley law breaking engaged in by hardened criminals constantly at odds with law and order. But to the agency most concerned with black market activity during and after World War II—the Office of Price Administration—the term always carried a much wider meaning. As commonly used by the agency, black market meant any sort of transaction in violation of price and rationing regulations, whether engaged in under the guise of conventional business practice or covertly pursued by professional racketeers.

In that broader sense, the Office of Price Administration's task of dealing with black markets continued to be a heavy one in 1946, even though, except for sugar, the agency's rationing programs had come to an end.

A number of factors made it increasingly difficult to maintain necessary controls and to apprehend violators of price regulations. The elimination of most rationing controls, coupled with the suspension of many limitation and allocation orders by the Civilian Production Administration and the department of agriculture, left uncontrolled a huge demand for still limited civilian supplies. Wartime industries were not yet fully reconverted to peacetime production. Feeding and supply requirements of foreign areas laid waste by war were at their peak. In the U.S. the population was increasing substantially as military demobilization went forward. And of utmost importance to the agencies charged with administering remaining controls was the fact that patriotic public support for government controls measurably diminished with the end of the war.

An expanded enforcement staff concentrated its efforts at the earlier levels of distribution in order to reduce the pressures which would otherwise be passed on and multiplied at later levels. In addition, trained investigators who had been assigned to combat counterfeiting of ration evidence were gradually shifted over to the work of apprehending major violators of

HANDS OF SUGAR RATION STAMP THIEF at New York City Stamp Verification centre glow with fluorescent powder under ultra-violet light. Officials set a trap for thieves in 1946 by daubing the cancelled stamps with this powder

price regulations.

During the first 11 months of 1946, the agency conducted 125,580 investigations. Violations were found in approximately 80% of the cases investigated. More than 40,000 civil and criminal actions were filed in federal and state courts, leading to many jail sentences and to the collection of more than \$17,000,000 in fines and settlements.

Until November, when their operations were ended, the local price control boards made up for the most part of volunteer aides recruited by the Office of Price Administration, held approximately 248,000 conferences with retailers charged with violation.

Black market practices, of course, found their greatest outlet in connection with the sale of short commodities most desired by the public. During 1946, major problems were encountered in the fields of meats, sugar, building materials and used cars.

Meats.—No scarce commodity was so dearly desired by such great numbers of people as meat. In this field the black market problem was always present on a major scale. As a seasonal shortage made itself felt in April 1946, violations mounted rapidly, and OPA enforcement officers were filing an average of 500 court cases monthly. Slaughter fell off sharply in May and June as livestock was withheld from the market awaiting the outcome of congressional debate on whether price controls should be continued beyond June 30. The Price Control act expired on June 30 when the president vetoed an extension bill which in his judgment had been weakened beyond the point of effectiveness. Immediately a large flow of livestock to market was noted as producers rushed to take advantage of soaring prices in a free market. Re-control took place in September and

by October supplies again had dropped sharply. On Oct. 14 all controls on meats were removed by direction of the president. Although this shifting between control and decontrol made enforcement of meat regulations difficult, thousands of actions, nevertheless, were brought against violators during the period.

Sugar.—The chief problems in connection with sugar rationing were the counterfeiting and theft of sugar ration evidences. With sugar rationing continuing throughout the year, many violators were apprehended and suspended from receiving or handling sugar, and large numbers of peddlers and distributors of counterfeit ration currency were prosecuted.

Building Materials.—Under pressure of increased demand for building and construction materials, violations with respect to lumber and other building materials mounted. In the second half of 1946 actions were instituted against such violators for more than \$15,000,000, and many major criminal proceedings were instituted.

Automobiles.—During 1946 the over-all supply of cars continued to be far short of demand. Large-scale rings of black market operators were selling thousands of automobiles at over-ceiling prices. OPA investigators and special agents broke major black markets in Detroit, Mich.; Cairo and Springfield, Ill.; Louisville, Ky.; Leesburg, N.C. and Los Angeles, Calif. Quick arrests, coupled with substantial fines and jail sentences caused a noticeable reduction in this illegal activity.

Other Fields.—Illegal transactions in the field of textiles, scrap metal and waste paper showed a substantial decline in the face of sharp enforcement activity. In New York, the leading textile selling centre of the United States, a special grand jury was in continuous session from Dec. 1945 through 1946, hearing evidence of criminal activity in textiles.

Rent.—While the expression black markets was not generally used in the fields of rents, enforcement activity against persons charging improper rentals or attempting illegal evictions increased substantially. Numerous cases were developed against persons demanding illegal bonuses, with resultant criminal prosecutions.

On Nov. 8, the president ordered the lifting of all price controls except those covering sugar, certain syrups and rice. Rent control and sugar rationing also continued in effect. This action had followed decontrol of meat and most other food products in October. Black markets in the decontrolled areas automatically ended. The enforcement staff of OPA reorganized to dispose of all pending cases in the decontrolled commodity fields. Some 20,000 enforcement cases were pending covering violations which occurred before decontrol. The price control act provided that offenses committed prior to termination of controls were to be treated as though the regulations were still in force for the purpose of sustaining any proper suit, action or prosecution. (W. E. Rv.)

Great Britain.—During 1946 the black market in Great Britain was smaller than in previous years since the controls were slightly fewer, but the market in cloth was still extremely large. This could be seen from the number of thefts and the very small amount of cloth recovered subsequently. Rolls of cloth and suit lengths were easily sold owing to the shortage. There was also a big market for clothing as distinct from cloth: this was made obvious by the large percentage of house-breaking offenses in which clothing formed part of the loot.

The black market was helped by the lenient manner in which the courts dealt with offenders when they were caught. The usual penalty was a fine, which meant little to persons making large profits. Only in the largest and most important cases were terms of imprisonment imposed, as in a linseed oil conspiracy which came to an end only in 1946. No fewer than 104 persons were prosecuted for various offenses in connection with these dealings

in oil and sentences totalling more than 60 years and fines of more than £20,000 were imposed. The crime started with large thefts by truck-drivers engaged in carting the oil from the pressing mills to the refineries. The oil was sold to various receivers who, in turn, through intermediaries, passed it on to a number of firms in the paint industry. Hundreds of thousands of gallons of linseed oil, of which there was particular scarcity, reached the black market in this way. An idea of the profits may be formed from the case of one receiver and his agent who made more than £11,000 in a period of six months.

At the end of World War II a large black market started in building materials. All building repairs of more than £10 in value required a licence from the ministry of works and planning, owing to shortages of material and labour. Some builders, who were prepared to take the risk of prosecution by using materials and labour which should have been available for work where a licence had been obtained, would undertake unlicensed repair work simply because they were offered a bigger profit than they could make on the licensed job.

Europe.—The black market continued to flourish on the continent of Europe in 1946, particularly in food, for in countries like France ordinary people were not able to get their proper rations and had to resort to the black market in order to exist. In Spain this was even more the case. Money lost its value and a system of barter arose. In Germany cigarettes took the place of currency, while in Italy, where no confidence was felt in the lira, everyone was eager to secure commodities. (R. M. Ho.)

Blandy, William Henry Purnell (1890—), U.S. naval officer, was born on June 28 in New York city and was graduated from the U.S. naval academy at Annapolis in 1913. Advancing through the grades, he was made a rear admiral (temporary) and appointed chief of the navy's bureau of ordnance, Feb. 19, 1941. He was transferred in 1944 to the Pacific war theatre as commander of an amphibious task force and participated in the fighting at Saipan, Iwo and Okinawa. Blandy, who had been raised to the rank of a vice-admiral, was made special weapons head of the navy and later commander of Joint Task Force I, Jan. 13, 1946, with the responsibility of conducting the atomic bomb tests at Bikini atoll. Subsequent charges that the test might be construed by foreign powers as a warlike gesture prompted Blandy's statement of April 16, 1946, that the Bikini operation was a "defensive measure," of caution and economy rather than one of "aggression."

Both the atomic bomb tests at Bikini (on July 1 and July 25, 1946) were conducted under his supervision and Blandy stated, July 29, that one of the lessons learned from the Bikini experiments was that warships of the future would require redesigning to meet the needs of the atomic age. In his report to Washington on Sept. 4, he disclosed that only 9 of the 92 ships in the target area escaped sinking, damage or radioactive contamination. On Nov. 12, 1946, Adm. Blandy was assigned to command the 2nd task fleet in the Atlantic.

Blue Cross: see INSURANCE.

Blum, Léon (1872—), French statesman, politician and Socialist leader was born on April 9, 1872, in Paris. For his early career, see *Encyclopædia Britannica*. Blum, who was twice premier of prewar France, was arrested in 1940 by the Vichy government and imprisoned by the Germans. In May 1945, he was liberated by U.S. troops from a German concentration camp in the Italian Alps.

After his return to Paris, Blum again became an influence in

French politics and appeared as a prosecution witness at the trial of Marshal Henri Pétain in July 1945. On Jan. 28, 1946, Premier Felix Gouin made Blum a special ambassador to foreign countries with authority to negotiate foreign loans. Blum's major mission was his trip to Washington where he signed (May 28) an agreement with the U.S. government settling French lend-lease accounts and securing credits totalling about \$1,370,000,000.

While Blum favoured co-operation with the French Communist party, he opposed a merger with it and endorsed the views expressed, Sept. 1, at the close of the Socialist Party congress, for continued independence. After Georges Bidault's resignation in late 1946, Blum was elected as interim premier by 575 out of the 590 votes cast in the French general assembly, Dec. 12. He formed an all-Socialist cabinet Dec. 16. Hardly 48 hours after his government took office, it was beset by an outbreak of fighting in French Indo-China where Viet Nam forces, demanding independence, attacked French troops. Blum, dispatching Gen. Jacques Leclerc to Indo-China, stressed that he planned to restore order before opening negotiations for Viet Nam independence. After the Fourth republic was officially proclaimed, Blum, who was in ill health, resigned as premier and was succeeded by Paul Ramadier, Jan. 17, 1947, who had been justice minister in the outgoing government.

Boetto, Pietro, CARDINAL (1871-1946), Italian prelate, was born May 19 in Vigone, near Turin. He entered the novitiate of the Society of Jesus at the age of 17, was ordained at 30 and became rector of the Jesuit college in Genoa in 1903. He held a succession of posts including that of secretary to the provincial of Turin province and later he became provincial of Turin. He was also procurator general of the Jesuits and in 1931 became consultant of the Sacred Congregation of Affairs of Religious. In the last named position, he worked closely with Pope Pius XI, who in 1935 named him a cardinal. He was raised from cardinal deacon to cardinal priest in 1938, when he also became archbishop of Genoa. Cardinal Boetto served as a member of a number of important Vatican institutions. In April 1945 he was credited with having persuaded the German forces in the Liguria area to surrender without battle—thus saving the densely populated region from further havoc. Cardinal Boetto, who was the only Jesuit member of the Sacred College of Cardinals, died in Genoa, Jan. 31.

Bogomolets, Alexander Alexandrovitch (1881-1946), Russian biologist, was born in a Kiev jail where his mother was held as a political prisoner. His father was a country doctor. He attended Odessa university and was professor of pathophysiology at Saratov university (1911-15) and at Moscow university (1925-31). He was dean of the Institute of Experimental Biology and Pathology at Kiev, and in 1930 was elected president of the Ukrainian Academy of Sciences. Dr. Bogomolets developed a serum, known as A.C.S. (anti-reticular cytotoxic serum) that many medical authorities hailed as a possible agent in treatment of such maladies as arteriosclerosis, arthritis and high blood pressure. During World War II, A.C.S. was used in treating wounded Red army soldiers and claims were put forth that it quickly healed wounds and knitted fractures. Other claims that it was a specific cure for cancer were repudiated by Dr. Bogomolets although he did assert that the serum would prevent deterioration of connective tissues and indicated that it had been used with positive results in post-surgical care of cancer patients to prevent recurrence of tumours. Bogomolets, who also was absorbed in the study of longevity, had evolved the theory that the normal life span of man should be between

125 and 150 years. In an interview in June 1946 he said it should be possible for a man to attain this age provided he used A.C.S. "when his connective tissues begin to deteriorate and he takes reasonable care of himself." The same month, his book *The Prolongation of Life* appeared in English and stirred up considerable public interest. Among his earlier works are *The Crisis in Endocrinology*, *The Science of Constitutions and Diatheses* and monographs on internal secretion, immunity and the pathology of circulation. Dr. Bogomolets himself, suffering from heart disease, was unable to use his own serum and he died on July 19 (at the age of 65), according to a Moscow radio report.

Bolivia. A land-locked republic in south central South America. Area, 419,470 sq.mi.; pop. (1944 est.), 3,533,900. The legal capital is Sucre (est. pop., 1946, 32,000); the real seat of government is La Paz (est. pop., 301,000). Other cities (with pop. estimates) include Cochabamba (80,000), Oruro (50,000), Potosí (40,000), Santa Cruz (32,800), and Tarija (27,000). Racial distribution is estimated to be 52.34% Indian, 27.5% mestizo, 13.08% white, 0.22% Negro and 6.85% unspecified. Bolivia is a unitary republic with a president popularly elected for a four-year term, a bicameral congress composed of a senate of 27 members and a chamber of deputies of 110 members and a judiciary headed by a supreme court of justice. Roman Catholicism is the predominant religion. Presidents in 1946: Lieut. Col. Gualberto Villarroel, to July 21; Nestor Guillén (provisional), July 21-Aug. 16; Tomás Monje Gutiérrez, from Aug. 16.

History.—The principal occurrence of 1946 was the bloody revolution which, in the latter half of July, overthrew the Villarroel government. The early months of 1946 were characterized by chronic disturbances. The elections of May 5 increased the strength of the Movimiento Nacional Revolucionario (the government party) to 13 out of 27 in the senate and 71 out of 110 in the chamber of deputies. The government on May 30 imposed a state of siege and, according to the opposition, began a reign of terror. Small units of the army air force attempted an unsuccessful revolt on June 13. The climax of the rebellious

SOLDIERS of the Villarroel government in Bolivia who joined the revolutionists during the uprising in the summer of 1946, in which President Gualberto Villarroel was killed

disturbances began at La Paz July 18 and resulted in two days of severe street fighting.

Pres. Villarroel named a completely military cabinet on July 20 and vainly tried to escape by plane. Rebels on July 21 attacked the presidential palace, hurled Villarroel from a balcony to the street where the aroused mob stripped the body and hanged it from a lamppost. Total casualties in the three days of fighting were estimated at 260 killed and 520 wounded. A provisional government was immediately set up under Nestor Guillén, dean of the La Paz district of the superior court; it quickly promised free elections (later scheduled for Jan. 4, 1947), political amnesty, abolition of censorship and other democratic measures. On Aug. 16, Tomás Monje Gutiérrez, president of the superior court, was inducted as provisional president. An attempted assassination of Pres. Monje on Sept. 27 resulted in a mob lynching of the would-be assassin and two others; the president was unhurt. The Bolivian embassy at Washington, D.C., on Oct. 28 revealed a document allegedly proving that the revolt of Dec. 1943 was instigated by Germany.

Education.—The latest available data showed almost 1,800 primary schools with approximately 160,000 enrolled, and about 80 intermediate schools with more than 11,000 enrolled; Bolivia has six universities. Illiteracy is estimated at 80%. The government in 1946 began, in co-operation with the Inter-American Educational foundation, a new curriculum for rural schools, emphasizing agriculture, health and sanitation.

Finance.—The theoretical monetary unit is the gold peso, valued at 20.6 cents U.S. currency; most transactions, however, are carried on in terms of bolivianos, valued at from 1.66 cents (Sept. 30, 1946) to 2.36 cents (Nov. 15), depending on the type of exchange. The 1946 budget totalled 1,286,371,147 bolivianos, an increase of about 33,500,000 bolivianos over that for 1945. In order to tighten the fiscal administration, the government prohibited the sale or transfer of gold between private persons. Credit authorizations, as of June 30, 1946, by the Export-Import bank of Washington, D.C., totalled \$15,500,000, of which \$1,200,000 was listed as the amount outstanding and \$14,300,000 as the undisbursed balance. The Bolivian government during the first half of the year authorized the Bank of the Argentine Nation (the largest such institution in Argentina) to open a La Paz branch. The official cost-of-living index for 1945 was 835 as against 100 for Dec. 1936.

Trade and Communication.—Foreign trade in 1946 continued on an uncertain basis because of protracted tin purchase negotiations. U.S. imports from Bolivia in 1945 were valued at \$27,900,000 (1944: \$31,100,000) and exports to Bolivia at \$14,200,000 (1944: \$12,400,000). Total value of Bolivian mineral exports in 1945 increased \$800,000 from that of 1944. Metal exports in the first five months of 1946 included: fine tin, 14,931 long tons; fine lead, 4,278 short tons; fine zinc, 9,913 short tons; fine copper, 2,685 short tons; wolfram, 51,809 short ton units; fine antimony, 2,739 short tons. Rubber exports in the first eight months of 1946 were 1,736 metric tons to the U.S. and 314 tons to Argentina; this represented a proportionate decrease from 1945 exports, which totalled 4,094.6 metric tons for the year.

Railway mileage is 1,407 and highway mileage 3,710. Construction proceeded slowly on the Bolivian section of the Arica (Chile)-Santos (Brazil) transcontinental railway. Construction on the Cochabamba-Santa Cruz highway, contracted in July 1945, continued, although under serious labour difficulties. The government appropriated 1,500,000 bolivianos for studying the feasibility of a highway from La Paz to the eastern lowlands. A railroad strike was settled June 2 by conceding wage increases. In the latter part of the year, Lloyd Aéreo Boliviano and Chile's Línea Aérea Nacional began negotiating a reciprocal agreement allowing each to fly into the territory of the other.

Agriculture.—Crop prospects were considered good at the beginning of 1946 but two months later a combination of drought, hailstorms and strikes of Indian farm workers reversed predictions. The government, in an effort to increase wheat production, raised the price to be paid by the mills. The government also attempted to improve livestock breeding in the altiplano. Coffee production in 1944-45 was estimated at 9,400,000 bags of 60 kg. The government continued with plans to establish an agricultural colony of 500 Mennonite families, each to be granted 200 ha. of land.

Mining.—Protracted tin purchase negotiations were finally concluded late in 1946, to run, however, only through Dec. 31, 1946. Terms included a base price of 62.5 cents a lb., a retro-active bonus of one cent a lb. for the first half of 1946 and a three-cent bonus for the second half if deliveries for the year reached a minimum of 17,600 metric tons, tonnage bonus penalties if deliveries fell short of that figure and continuation of a smelting bonus of 1.5 cents a lb. Exports of the four producing companies contracting with the U.S. were 10,385 metric tons in the first half of 1946. Production of the Patiño interests was under contract, at the same prices, to Great Britain. Bolivian production of fine tin in 1945 was 43,147 metric tons (1944: 39,342 tons). Production of crude petroleum in 1945 was 381,554 bbl. (1944: 313,262 bbl.). Y.P.F.B. (the government petroleum agency) and the revolutionary junta agreed on a new petroleum policy involving construction of additional pipelines and topping plants, the drilling of 50 new wells and exploitation of certain zones by private capital under Y.P.F.B. direction; the new program, it was stated, would be financed in part by the Export-Import bank.

Bonnet, Henri (1888–), French diplomatist, was born on May 26 in Chateauponsac (Haute-Vienne), France. He studied at the Université de Paris and was graduated from the École Normale Supérieure. He was drafted into the army during World War I, rising to a captaincy and was cited several times for bravery.

After the war, he became foreign editor (1919) of *L'Ere Nouvelle*, a Paris newspaper, and from 1920 to 1931, he was associated with the League of Nations in subexecutive posts. He left Geneva in the latter year to become director of the International Institute of Intellectual Co-operation and from 1931 to 1940 he was also vice-president of the Centre of Studies of Foreign Policy in Paris.

Bonnet fled to London after the collapse of French resistance in 1940 and later emigrated to the United States. In 1943, he was named commissioner for information by the Committee of National Liberation and went to Algiers to assume his new post. The following year, he was made information minister of the provisional government in Paris and on Nov. 28, 1944, he was appointed ambassador to the United States. Bonnet attended the United Nations conferences in San Francisco in 1945, and represented France at the security council sessions that opened in New York city, March 25, 1946. During debate on the Iranian dispute, Bonnet supported Andrei Gromyko's request that the case be dropped, April 15, and two days later, voiced approval of Dr. Oscar Lange's resolution calling for a diplomatic break with Franco's regime. On May 3, he was appointed to the U.N. atomic energy commission.

Chapter 10

52

A large rose tree stood near the entrance of the garden: the roses on it were white, but there were three gardeners at it, busily painting them red. This Alice thought a very curious thing, and she went near to watch them, and

just as she came up she heard one of them say "look out, Five! Don't go splashing paint over me like that!"

"I couldn't help it," said Five in a sulky tone, "Seven jogged my elbow."

On which Seven lifted up his head and said "that's right, Five! Always lay the blame on others!"

"You'd better not talk!" said Five, "I

Book-Collecting and Book Prices. The post war era found bookmen ready to resume the activities so abruptly concluded at the outbreak of World War II. This was especially true in Great Britain where, in 1946, restrictions which had prevented the importation of rare books were rescinded. Removal of these wartime provisions enabled British collectors to compete in foreign markets but the effect was not at once measurable. During the war years the United States had produced a creditable group of bibliographical works, an activity denied Great Britain; but with a return to a period that promised a more normal existence Great Britain hastened to prove that it was still bibliographically alert. Most important indication of this awareness was the announcement that the Bibliographical society (London) was preparing to issue a reprint edition of *The Short-Title Catalogue*; and an extended edition of Theodore Besterman's *World Bibliography of Bibliographies* was in press.

The British booktrade returned to almost full-time activity; there was no sign that the high and often inflationary prices of the war years would decrease. U.S. dealers complained that in many instances they were unable to purchase books in Great Britain because of high prices. This condition, but in a more aggravated state, prevailed on the continent where inflation produced an uncertainty that made trading difficult and often impossible. Continental shops priced their stocks on a day-to-day basis, using black market commodity prices as the standard. This factor was duly reflected in the United States which, for the first time in six years, was able to send buyers to the continent.

The rare book market in the United States was on an infinitely more stable foundation, and continued to react to keen collector interest; prices for genuinely rare books continued high. New York's Parke-Bernet galleries, which had become the rare book centre of the world, was able to report that its 1945-46 season had reached an all-time high of \$6,684,045, but it must be noted that the figure included the sum total realized for not only literary properties but also other collected materials. In April Parke-Bernet sold the first part of the Eldridge R. Johnson collection, the most spectacular item being the original manuscript of Lewis Carroll's *Alice's Adventures Under Ground* which brought \$50,000. Some months later there was put on foot a movement to purchase the manuscript by semi-public subscription for the purpose of presenting the manuscript to the British people as a gift from the United States. Also in April, the same galleries dispersed the third portion of the Frank J. Hogan library, disposing of, among other pieces: the Manley-Rosebery copy of the First Folio of Shakespeare (1623), \$50,000; a made-up, but nevertheless highly desirable copy of the first edition of *Pilgrim's Progress* (1678), \$8,000; a first edition of Chaucer's *Canterbury Tales* (1478), lacking 80 leaves and with a few other leaves supplied, \$13,000; a first edition of the King James version of the Bible (1611), \$4,000.

At the opening of the fall auction season in the United States good books continued to find a ready market at equitable prices but there was the merest hint that buyers were becoming cautious and that the buying tide might turn. Earlier in the season the London rooms disposed of the fifth part of the C.F.G.R. Schwerdt collection of sporting books; prices realized were high. The sale of this final part of the library brought £24,000.

In bibliography the United States produced several works worthy of mention: *A Primer of Book-Collecting* by John T. Winterich and David A. Randall, an extended revision of the original Winterich work which was first published in 1926; *American Book-Prices Current: Index 1941-1945* by Colton Storm, completing the index for the work from 1916 through 1945; Mary A. Benjamin's *Autographs: A Key to Collecting*.

(J. Bk.)

Book Publishing. Title production figures for the U.S. for 1946 reflected a prosperous year with an increase of 1,187 over 1945, in contrast to the steady drop in production during the years of World War II. Fiction presented the greatest single increase with 429 new titles, followed by juvenile books, with 186 new titles. Books dealing with games and sports, fine arts, business, geography and travel had the greatest proportional increases, indicating the nation's peacetime concerns. Philology and technical and military publications continued to decline; philosophy and ethics also declined after their sharp increase in 1945. Table I, compiled by *Publisher's Weekly*, summarizes U.S. book publication for 1945 and 1946.

Best Sellers.—Daphne du Maurier's *The King's General* led the 1946 list of fiction best sellers with a book-store sale of 228,235 and a book-club sale of 867,336, totalling 1,095,571. Taylor Caldwell appeared for the first time on the annual best-seller list, ranking second with her *This Side of Innocence*, a Literary Guild selection which had a trade sale of 221,000, and a total sale of 1,276,000. Third place was taken by another newcomer to the annual list, Frances Parkinson Keyes, for her *River Road*. Russell Janney's *The Miracle of the Bells*, the only fiction best seller that was not a book-club selection, placed fourth followed by *The Hucksters* by Frederick Wakeman, *The Foxes of Harrow* by Frank Yerby, *Arch of Triumph* by Erich Maria Remarque, *The Black Rose* by Thomas B. Costain, *B. F.'s Daughter* by John P. Marquand and *The Snake Pit* by Mary Jane Ward. Betty MacDonald's *The Egg and I*, fourth in 1945, headed the nonfiction list in 1946 with a trade sale of 496,000

and a total sale of 1,038,500. Joshua L. Liebman's *Peace of Mind* was second, succeeded by Elliott Roosevelt's *As He Saw It*, Frances Perkins' *The Roosevelt I Knew*, Ernie Pyle's *Last Chapter*, Thomas Sugrue's and Col. Edmund Starling's *Starling of the White House*, Victor Kravchenko's *I Chose Freedom*, Emery Reves's *The Anatomy of Peace*, Ralph Ingersoll's *Top Secret* and Gene Fowler's *A Solo in Tom-Toms*.

Great Britain.—British book production rose sharply in 1946 with a total output of 11,411 new titles, new editions and reprints, the highest figure after 1939. The greatest single increase was shown in the trade, commerce and industry classification which produced a total of 1,640 including 1,381 *Reports on German Industry* by the board of trade. Considerable gains were made in the fiction and children's book fields, as well as in politics and religion. Table II, compiled by *The Bookseller*, gives statistics for the British book-publishing industry, 1944-46. (See also AMERICAN LITERATURE; ENGLISH LITERATURE; NEWSPAPERS AND MAGAZINES.)

Bormann, Martin (1900-), German politician, was born on June 17 in Halberstadt, Germany. An avowed and vocal pan-German, he participated in the German free corps raids along the Latvian border after the close of World War I. Bormann was imprisoned in 1923 for participation in a political murder, and after his release he joined the National-Socialists. He became head of the Nazi press in Thuringia in 1926 and was deputy supreme leader of the *Sturmabteilung* (Storm troops). In 1933 he became chief of staff to Rudolf Hess, then deputy Fuehrer, and also a member of the Reichstag. On Oct. 16, 1942, Adolf Hitler appointed Bormann to fill the post of deputy Fuehrer, succeeding Hess who

had made his strange flight to Scotland the year before. As such, Bormann exercised even greater administrative control over the party than had Hess. Bormann was active in persecution of the Jews, in the looting of artistic and cultural properties in eastern Europe and in expanding the German slave labour program. He disappeared shortly after the death of Hitler and it was presumed that he was either dead or in hiding. He was indicted Aug. 29, 1945, along with other Nazi leaders on charges of war crimes and was found guilty and sentenced to death in absentia by the international military tribunal at Nuernberg on Oct. 1, 1946. In its verdict, the court ruled that if Bormann were captured later, the Allied Control Council would be permitted to review his sentence if any mitigating factors in his defense were brought up.

Borneo. An island of the Malay archipelago, between 7° N. and 4° 20' S., 108° 53' and 119° 22' E.; area 293,496 sq.mi. (calculation of Topographical Bureau, Batavia); 830 mi. long N.E. to S.W., 600 mi. maximum breadth. Pop. about 3,100,000, of which 90% were Indonesian (Malays and Dyaks), the remainder Europeans (about 5,000) and Chinese (250,000); pop. density about 10 per square mile.

Many of the Indonesian natives lived on a very primitive level of culture and social organization and almost all were illiterate. Many were Moslems, although pagan worship predominated. Malay as well as countless native dialects were spoken.

Borneo was divided under British and Dutch control into a number of administrative units. Dutch Borneo, located in the southern portion of the island, included about three-fourths of the total area with about two-thirds of the population.

British Borneo.—British Borneo consisted of: (a) North Borneo (pop. 1931, 270,000; area, 29,500 sq.mi.), formerly administered by a chartered company on behalf of the British government, became a British colony on July 15, 1946; (b) Brunei (pop. 1931, 30,000; area, 2,200 sq.mi.), on the northern coast, a protectorate formerly ruled by a sultan with a British resident, but after World War II its administrative status was not clear; (c) Sarawak (pop. 1938, 467,000; area, 50,000 sq.mi.), on the northwest coast, formerly a protectorate under the rule of Sir Charles Viner Brooke, the "White Rajah," until July 1, 1946, when it became a British colony after the state had been turned over to Great Britain by the rajah with the endorsement of the Sarawak state council; and (d) Labuan (pop. 1934, 7,500; area, 30 sq.mi.), a small island off the North Borneo coast, formerly under the jurisdiction of the Straits Settlements but after World War II a part of the colony of North Borneo. Principal towns of British Borneo: Kuching, capital of Sarawak (1941 pop. 34,000); Sandakan, capital of North Borneo (pop. 13,700); Brunei, capital of Brunei (1938 pop. 12,000); Miri (Sarawak) (1941 pop. 10,000); and Jesselton (North Borneo) (1940 pop. 10,000).

Dutch Borneo.—With a population (1930) of 2,200,000, an area of 210,000 sq.mi., Dutch Borneo consisted before World War II of 2 residencies ruled directly by residents responsible to the governor of Dutch Borneo, who in turn was responsible to the governor general of the Netherlands Indies, and 17 native states headed by native rulers but under Dutch control. As a result of active native discontent after the end of the war in opposition to Dutch rule, especially in Java and Sumatra where hostilities occurred for many months, at the end of 1946 there was under consideration a plan for the formation of a "United States of Indonesia" in equal partnership with the Netherlands in the "Netherlands—Indonesia Union." This plan, which was drawn up by a Dutch and Indonesian delegation, would establish three autonomous states in the United States of Indonesia: the Indonesian republic (Java, Sumatra

and Madura), Dutch Borneo and East Indonesia (Celebes, Moluccas, the Lesser Sundas and possibly Dutch New Guinea). Principal towns of Dutch Borneo: Bandjermasin, capital (1930 pop. 65,700); Pontianak (45,200); and Balikpapan (29,800).

Economy.—Borneo had a primitive agrarian economy, with rice the chief food, supplemented by sweet potatoes, maize, soybeans, coconuts, fruits and fish. The island's chief economic importance, however, was its petroleum resources; it also produced rubber, coal and forest products. During World War II Borneo supplied Japan with considerable quantities of these resources. Major oil fields were at Seria (Brunei), Tarakan (Dutch Borneo) and Miri (Sarawak); major oil refineries were at Balikpapan (Dutch Borneo) and Lutong (Sarawak). About 20,000,000 bbl. of crude petroleum were produced in 1940. In the same year an estimated 650,000 tons of coal and 30,000 tons of rubber were produced. Borneo had a railroad with total trackage of about 100 mi. and a number of small industrial railroads; in 1940 there were about 2,000 mi. of roads, less than half of which were usable throughout the year. (See also BRITISH EMPIRE; NETHERLANDS COLONIAL EMPIRE; NETHERLANDS INDIES.)

BIBLIOGRAPHY.—*Orient Yearbook* (1942); *Statistical Abstract of the Netherlands Indies*, Department of Economic Affairs, Central Bureau of Statistics, Batavia (1940); *Economisch Weekblad* (Economic Weekly) (1941); M. W. Stirling, *The Native Peoples of New Guinea*, Smithsonian Institution (1943). (S. NR.)

Boron Minerals. The production of boron minerals in the United States increased from 277,586 short tons in 1944 to 325,935 tons in 1945, the largest output after 1937. Four producers reported outputs of borax, anhydrous sodium tetraborate, kernite, boric acid and colemanite, all from California. The ceramic industry was the major consumer, but use in fertilizers was expanding.

Normally, the United States supplies a large share of the world demand, and one-third or more of the domestic output was exported. During World War II exports dropped heavily, but during 1946 a postwar renewal of export sales was easing the shock of shrinking home consumption in markets no longer stimulated by war demands, chiefly in the glass industry.

(G. A. Ro.)

Boston. Ninth largest city of the United States, with a population of 770,816 by the federal census of 1940. Boston is a seaport at the head of Massachusetts bay and is the capital of the state of Massachusetts. Area, 43.9 sq. mi., comprising most of Suffolk county.

U.S. Representative James M. Curley (Dem.) became mayor (4-yr. term) on Jan. 7, 1946. On Jan. 18 Mayor Curley was found guilty in a federal court in Washington, D.C., of using the mails to defraud and sentenced to 6 to 18 months' imprisonment and \$1,000 fine. This sentence was suspended while the case was being appealed.

Veterans' services were reorganized in the veterans' rehabilitation division which processed 59,897 individuals. The acute housing shortage was increased by the great influx of students into the colleges of the metropolitan area. The army released Camp McKay, South Boston, and it was converted into 248 units of veterans' housing. The Boston Housing authority developed 600 additional units in Franklin field and Alsen playground. Two federal housing projects were abandoned because of the expense of complying with the Boston building code. The state legislature refused to sanction Mayor Curley's proposed bond issue for current expenses but authorized borrowing for an extensive program of off-street parking facilities, including a garage under the famous Boston Common. The legislature also made appropriations for a new vehicular tunnel between Boston and East Boston.

The Boston Port authority purchased the Castle Island ter-

minal in South Boston which was built by the army during World War II at a cost of \$15,000,000.

The work on extending the runways at Logan International airport was nearly completed. The first Boston-to-Paris plane service was established from Bedford airport. The Boston elevated fare for local rides was raised from five to ten cents. The Boston Medical Center for Children was initiated by the merger of five institutions.

The temporary \$200 a year cost-of-living salary adjustment for city and county employees was made permanent and an additional increase of \$200 was authorized for 1947. A new Teachers alliance comprising a majority of the 4,000 public school teachers demanded a salary increase of from \$800 to \$1,200 which was refused by the mayor. School enrolment was 94,000, a decline of 2,000.

The 1946 tax rate was \$42.00 (1945—\$42.50) on an assessed valuation (real and personal) of \$1,536,385,600, an increase of \$57,213,600. Tax exempt property: 27% of assessed valuation. Budget: (city and county) \$55,328,186.37, an increase of \$5,067,530; (schools) \$17,575,791.87, an increase of \$38,000. In the period Jan.—Oct. 1946, bank clearings increased 9.5%, bank debits increased 1.1%, department store sales increased 29.9%, manufacturing employment decreased 17.5%, manufacturers' payrolls decreased 22.2%.

(S. J. McK.)

Botanical Gardens: see BOTANY.

Botany. The year 1946 witnessed a partial return to normal in the field of botany after the years of World War II. Many botanists serving in the armed forces or assigned to war research projects returned to their permanent posts.

News in regard to the condition of botanical laboratories, museums and herbaria in war-torn countries continued to come in. The herbarium in Berlin-Dahlem, with its large number of type specimens, was completely destroyed, as was the Botanical institute at Jena. The botanical facilities and collections at the University of the Philippines were completely destroyed. The herbarium of the University of Tokyo was unharmed. That of the University of Munich was also saved. The Centraal-bureau voor Schimmelcultures at Baarn, Holland, escaped damage and began active distribution of fungus cultures on the same basis as before World War II.

The year witnessed the organization or reorganization of a number of agencies of importance in the botanical field. The newly organized Institute of Radiobiology and Biophysics at the University of Chicago was headed by a botanist, Dr. R. E. Zirkle. The 11 separate botanical agencies which have existed at Harvard university were consolidated into two administrative units. These were the Institute for Research in General Plant Morphology, which included the Gray herbarium and library, the Farlow herbarium and library, the library of the Arnold arboretum and the Botanical museum; and the Institute for Research in Experimental and Applied Botany, which included the Arnold arboretum, the Bussey institution, the Cabot foundation, the Harvard forest and the Atkins garden and laboratory in Cuba.

After a lapse of several years, the annual meetings of the various plant science societies were resumed. The Botanical Society of America and related societies met with the American Association for the Advancement of Science in St. Louis in March 1946, and again in December, in Boston. The American Institute of Agronomy met at Columbia, Mo., in November. The British Bryological society celebrated its 50th anniversary in London, in September. The British Mycological society also observed its 50th anniversary a month later.

The rapid development of interest in Microbiology, resulting

from wartime discoveries of antibiotics and the importance of micro-organisms for bio-assay purposes, culminated during the year in the establishment of a microbiological section of the Botanical Society of America, which arranged a large and important program at the Boston meeting.

Research Projects Reported Upon in 1946.—L. Ajello succeeded in analyzing the nutritional requirements of a chytrid-Polychytrium. This fungus is capable of synthesizing all the vitamins necessary for its growth. It can use chitin as a source of nitrogen but not of carbon. Nitrogen may be obtained from both organic and inorganic sources.

C. B. Buell and W. H. Weston discovered that fungus cultures can be maintained for long periods of time by covering the slant with mineral oil. The oxygen consumption of fungi being thus grown can be measured accurately and the condition of the culture thus determined.

A. Hollaender, C. P. Swanson and I. Posner found that the sun yields ultra-violet radiation of sufficient intensity to induce a certain amount of mutation in fungus material. Swanson and Hollaender also found that the mutation rate resulting from high energies of ultra-violet is increased if material is treated first with near infra-red, although the latter alone does not produce mutation.

S. Spiegelman and M. P. Kamen produced evidence to show that the cytoplasmic self-duplicating entities present in yeast, which are connected with enzyme synthesis, are nucleoproteins and are derived directly from the genes. Albert Levan, studying the effect of camphor, butyric alcohol and benzene on the nucleus of yeast, showed that the Feulgen-positive material is chromosomal and not centriolar, as has been claimed.

S. R. Bose found an antibiotic substance in a polyopore commonly found in India which is effective against important gram-positive and gram-negative organisms. It appears to be nontoxic.

H. H. Dixon found that nuclei which are not surrounded by walls (e.g., embryo sac, endosperm) tend to divide synchronously as opposed to those which are surrounded by walls. Mitoses sweep through such a tissue in a wave, which suggests that mitosis is controlled by a hormone, the wave of division following the diffusion of the hormone.

Ernest Ball, studying the growth of shoot apices of lupine, which had been slit lengthwise into quadrants, found that each quadrant developed into a normal shoot. This did not come about from dedifferentiation of mature tissues, but was controlled by the apical meristem itself. The shoot apex, therefore, produces the tissues of the shoot, independent of control by the mature shoot.

Very young hypocotyls of seedlings from which roots had been removed were found by Carl D. La Rue to produce outgrowths identical with root hairs. They will not form if the cotyledons are also removed.

It was found by H. E. and G. L. Warmke that the regeneration of short segments of fleshy taproots can be controlled experimentally. Ordinarily, leaves develop from the proximal cut surface, roots from the distal surface. If segments are treated with indolebutyric acid, roots grow from both surfaces; if the segments are subjected to prolonged washing or to chemicals known to reduce auxin content, both surfaces produce leaves. Thus, either roots or leaves can be produced, depending upon whether the auxin content is increased or decreased.

S. G. Wildman, M. Ferri and J. Bonner produced evidence to show that tryptophan is probably the precursor of auxin in spinach leaves. Before auxin can perform in growth, it must combine with a protein to form a specific enzyme. Diffusible auxin is auxin formed from tryptophan but not yet combined with protein.

Books published during the year include:

Action of Radiation on Living Cells, by D. E. Lea; *Pure Cultures of Algae*, by E. G. Pringsheim; *Marine Microbiology*, by C. E. ZoBell; *Modern Aspects of Plant Nutrition*, by Walter Stiles; *pH and Plants*, by James Small; *Genera Filicum—The Genera of Ferns*, by E. B. Copeland; *Guide to Southern Trees*, by E. S. and J. G. Harrar; *Flora of Guatemala, Pt. IV*, by P. C. Standley and J. A. Steyermark. (See also BIOCHEMISTRY; GENETICS.)

Botanical Gardens.—Brooklyn Botanic garden celebrated Forsythia day, April 10, with the purpose of establishing the forsythia as Brooklyn's official flower. Funds granted by Mrs. Edward C. Blum made possible the observance of the day annually. A postwar conference on community planting was held by 36 organizations from New York, New Jersey and Connecticut. Plans were discussed for beautifying communities by specific planting projects. The New York Botanical garden announced four types of industrial memberships: (1) industrial contributing member, (2) industrial sustaining member, (3) industrial patron and (4) industrial benefactor. Dr. H. A. Gleason (*N.Y. Bot. Gard. Jour.* Oct. 1946) announced that during the period, 1897–1946, the garden had 248 different plant exploring expeditions. In 1946 L. J. Brass was in Nyasaland, Bassett Maguire and Arthur Holmgren in the Intermountain region and Otto Degener in New Providence Island, Bahamas. The Arnold arboretum in 1947 would celebrate its 75th year. It was the first arboretum as such, but after its organization, and indeed within the 20th century, the idea had expanded until there were 60 within the United States in 1946, some of them large and well endowed, such as the Morris arboretum at Philadelphia and the Morton arboretum, Lisle, Ill.

Montreal Botanical garden started two new gardens in 1946. The garden of plants used by the American Indians for food, fibre, dyes, etc. contained 474 species of American plants. A new garden of dwarf fruit trees was also started for the purpose of showing the opportunities offered to small private property owners by dwarfed fruit trees. The Hemlock arboretum at "Far Country," Germantown, Pa., with nine different species of *Tsuga* and 40 varieties of these species, announced that it had no room for further gifts without disposing of some of its plants.

Federated Garden Clubs of Missouri dedicated a boxwood garden at the Missouri Botanical garden. This included a large number of box varieties collected by an expedition to the Balkans. This promised the midwest superior selections of these highly prized evergreens. The Missouri Botanical garden reopened the Canal Zone station with Paul H. Allen as tropical collector. During 1946 Morton arboretum devoted

much attention to building roads through the grounds so that traffic could be routed one way during busy seasons, particularly the months of May and October. During 1946 the following important activities occurred at the University of Washington arboretum, Seattle, Wash.: a large number of trees and shrubs were placed in their systematic positions in the arboretum; the second annual Camellia show was held under the auspices of the Amateur Gardeners club of Seattle; and the first annual Rhododendron show was held and jointly sponsored by the Arboretum foundation and the American Rhododendron society. Dr. John H. Hanley, director, was granted six months' leave of absence from the university to study and do research work in England, more particularly at Kew gardens.

Robert Allerton made a gift of "The Farms" (6,000 ac.), Monticello, Ill., to the University of Illinois. Robert Allerton park and the residence with the valuable art collection provide for a co-ordinate research program in forestry, entomology, zoology, biology and in fine and applied arts blending architecture and landscape architecture. One hundred acres were set aside for 4-H clubs and related educational programs. Much of the rich land was to be continued as grain and stock farms to support the educational and research programs. (See also HORTICULTURE.)

Bowes, Edward (1874–1946), U.S. theatrical producer and radio showman, was born on June 14 in San Francisco. While working as an office boy in a real estate firm, he displayed a talent for the business, and soon became a prosperous real estate agent on his own. He quickly made a fortune, which was just as quickly wiped out by the San Francisco earthquake in 1906. However, he recouped his wealth to some degree and moved to the east coast, where he specialized in supervising construction, operation and direction of several theatres in New York and Boston. He served in the intelligence department in World War I and was a staff specialist in the officers reserve corps with the rank of a major. In 1919, he joined the Goldwyn Pictures corporation as vice president, continuing his connections with that company after its merger in 1924 with the Louis B. Mayer firm. In 1934, he became manager of a New York radio station, and inaugurated an "amateur hour" program. The program soon won nationwide popularity, and the stream of amateurs flocking to his studios from all parts of the nation for a "try at fame" flooded New York city's relief rolls. As a result, Maj. Bowes was compelled to move his auditions elsewhere. In 1935, the Maj. Bowes' "Amateur Hour" was one of the most popular radio programs in the United States. Its rating soon dwindled, however, and by 1945 it no longer was regarded as a "top drawing-card," although it still had a substantial following in rural areas. Maj. Bowes, who left the program in 1945, died in Rumson, N.J., on June 13.

Bowles, Chester (1901–), U.S. advertising executive and government official, was born in Springfield, Mass., Aug. 5. A graduate of Yale, 1924, he became an advertising copywriter and together with William Benton formed the advertising firm of Benton and Bowles, July 1929. Bowles was made chairman of the board of that company in 1936. In Jan. 1942, he took a leave of absence to work on a dollar-a-year job in Connecticut, later becoming OPA administrator for the state. On July 15, Prentiss M. Brown, then OPA national director, named Bowles as general manager of his agency. On Oct. 25, 1943, Bowles succeeded Brown who had resigned four days earlier as OPA administrator. Throughout 1944 and 1945, and also in 1946, Bowles battled continually and vigorously to maintain price controls. His stand was unpopular with many businessmen, and he was subjected to a sustained barrage of intensive criticism. On Feb. 14, 1946, Pres. Truman re-established the Office of Economic Stabilization and named Bowles its director. Bowles appealed to congress (May 18) for funds to fight the black market. After the senate passed a measure extending OPA but weakening its price controls, Bowles resigned (June 28) with a warning that price control under the new bill would be impossible and urged the president to veto it.

AUTOMATIC PINSPOTTER BEING CHECKED by its inventor, Fred Schmidt, before its unveiling at the American Bowling Congress tournament in Buffalo, N.Y., March 14, 1946. The machine was designed to perform all the tasks of the pin boy, including the return of the ball

Bowling. Carrying on from his 1945 success in winning the individual match game championship, Joe Wilman of Berwyn, Ill., led the way in the return of the annual American Bowling congress tests. The A.B.C. returned to the sports scenes after a three-year war recess, attracting a total of 25,567 entries to Buffalo, N.Y. Wilman won the all-events crown with 2,054 pins and thus became the eighth bowler in tournament history to win three crowns. He won the all-events title in 1939 and captained the Chicago Budweisers, winner of the 1942 team championship.

Leo Rollick of Santa Monica, Calif., and formerly of Chicago, won the A.B.C. singles with 737. Henry Kmiodowski and John Gworek, two Buffalo unknowns, swept their way to the doubles championship with 1,360. The Llo-Da-Mar team of Santa Monica captured the team title. As a result of his first in singles, second in all-events and place on the winning team, Rollick became the highest prize winner in tournament history. He totalled \$945.

Andy Varipapa, 52-year-old trick shot artist from Hempstead, L.I., won the national individual match game championship late in 1946. He defeated Allie Brandt of Lockport, N.Y., by 12 pins. (M. P. W.)

Boxing. Record-shattering activity developed in boxing through 1946. No less than 15 championship bouts were held. Every ring division of the eight standard classes held championship battles. The unprecedented admittance price of \$100 was imposed. One club, the Twentieth Century Sporting club, New York city, admittedly the world's foremost promotion organization, grossed close to \$5,500,000 conducting bouts in three arenas, viz., Madison Square Garden, the St. Nicholas arena (indoors) and the Yankee stadium (outdoors), all in New York city.

The year ended with but one class championship in dispute, which was something of an odd record. Only in the lightweight division was there contention over possession of the world championship. Bob Montgomery of Philadelphia, Pa., and Ike Williams, Camden, N.J., were the disputants to this title. Montgomery, recognized as champion in New York state and in Pennsylvania, made two defenses of his championship status. Williams, recognized as champion by the National Boxing association, wielding jurisdiction in all other boxing centres throughout

the country, fought twice in defense of his standing.

Joe Louis twice defended his world heavyweight championship, passing successfully through his 22nd and 23rd defenses after winning the crown from James J. Braddock in Chicago, Ill., in 1937. He knocked out Billy Conn, Pittsburgh, Pa., in 8 rounds of a scheduled 15-round bout at the Yankee stadium June 19. On Sept. 18, Louis knocked out Tami Mauriello, Bronx, New York city, in 2 min. 9 sec. of the first round of a scheduled 15-round bout in the same arena.

The Louis-Conn bout, eagerly awaited by boxing follower during the four years and more of war service for champion and challenger that followed their first meeting in 1941, was a disappointment, competitively. Yet, it was the medium for the first \$100 ticket charge in boxing history, and exceeded \$2,000,000 in receipts. A crowd of 45,266 saw the battle, paying gate receipts of \$1,925,564 for the privilege. Additional income from radio, television and motion pictures, boosted the receipts beyond the \$2,000,000-mark. The bout against Mauriello was infinitely more exciting though of shorter duration and altogether one-sided for Louis. Knocked across the ring with a right-hand punch to the jaw, the first blow of the battle, Louis rebounded with a savage fire that quickly put the quietus on Mauriello, before a crowd of 38,494, which paid receipts of \$335,063.

The most active champion of the year was Manuel Ortiz, El Centro, Calif., holder of the world bantamweight title. He defended the honour three times, knocking out Luis Castillo, in 13 rounds at San Francisco, Calif., Feb. 25; Kenny Lindsay, in 5 rounds at Hollywood, Calif., May 25, and Jackie Jurich in 11 rounds at San Francisco, June 10.

The year's most spectacular championship bout was waged Sept. 27 in the Yankee stadium, New York city, when Tony Zale, world middleweight champion, knocked out Rocky Graziano, of New York's east side, in six rounds. This was Zale's first title defense, following more than four years of service in the war, and he had to survive the knockdown punches of his most dangerous hitting challenger. He did this in a manner to thrill 39,827 onlookers, who contributed receipts of \$342,497.

Gus Lesnevich, world light-heavyweight titleholder, participated in a record-making championship bout of international flavour. He knocked out Freddie Mills, European champion, in ten rounds at London, Eng., May 4, before a crowd of 12,000

JOE LOUIS IS SMASHED ON THE CHEEK by a powerful right from Tami Mauriello in New York's Yankee stadium on Sept. 18, 1946. A few seconds later Louis knocked out the challenger to retain his heavyweight championship of the world

persons, who paid receipts of \$176,000. The receipts were announced as a record for Great Britain.

Willkie Pep, Hartford, Conn., knocked out Sal Bartolo, Boston, Mass., in 12 rounds at Madison Square Garden, New York city, June 7, to gain undisputed possession of the world featherweight title. The 126-lb. championship had been in dispute until this match. Ray Robinson of New York city, won a 15-round decision over Tommy Bell, Youngstown, O., Dec. 20, in Madison Square Garden, to clear away confusion that surrounded the world welterweight championship. The resignation of Marty Servo of Schenectady, N.Y., who announced his retirement because of illness earlier in the year, left this title without a recognized holder until Robinson and Bell fought under agreement the winner would be universally recognized as champion.

In defense of his world lightweight championship standing Montgomery knocked out Allie Stolz, Newark, N.J., in 13 rounds at Madison Square Garden, June 28, and on Nov. 26 in Philadelphia knocked out Wesley Mouzon, in 8 rounds. Williams retained his claim to the N.B.A. distinction by knocking out Enrique Bolanos, in 8 rounds at Los Angeles, Calif., April 30, and Ronnie James, in 9 rounds at Cardiff, Wales, Sept. 4.

Only one flyweight championship was recorded. In this bout Jackie Patterson, the champion, won a 15-round decision over Joe Curran, in Glasgow, Scotland, July 10.

Amateur and intercollegiate boxing experienced wider activity on a competitive basis and greater interest from the spectator standpoint. In the Amateur Athletic union's national championship tournament held at Boston, a Hawaiian team tied with marines from Cherry Point, N.C., for the team championship, each with ten points. Duplicate trophies were awarded. In the 23rd annual Intercollegiate Boxing association championship tournament held at West Point, the cadets won the team championship for the fourth time after 1936, with 20 points. (J. P. D.)

Boynton, Percy Holmes (1875-1946), U.S. educator, and authority on American and English literature, was born on Oct. 30 at Newark, N.J., and was graduated from Amherst college, Amherst, Mass., in 1897. He continued his education at Harvard university, Cambridge, Mass., where he received his A.M. degree in 1898, and in 1902 he joined the University of Chicago faculty where he became professor of English, 1923; he retired as professor emeritus in 1941. Author of several works on English and American literature which became standard textbooks, and a recognized literary expert, he was a well-known lecturer and a frequent contributor of articles on literature to magazines. A lover of fine music, he encouraged and developed a series of symphony concerts during his years on the campus. He served as dean of the university's College of Arts, Literature and Sciences, 1912-28, and as the principal of the summer school, 1914-17. Prof. Boynton was the first member of the faculty to sponsor the University of Chicago Round Table, a weekly radio program. His works include: *Principles of Composition* (1915), *History of American Literature* (1919), *Some Contemporary Americans* (1924), *More Contemporary Americans* (1927), *The Rediscovery of the Frontier*, and *The Challenge of Modern Criticism* (1931), *Literature and American Life* (1936) and *The American Scene in Contemporary Fiction* (1940). He died at New London, Conn., on July 8.

Boy Scouts. The 36th annual meeting of the National Council of the Boy Scouts of America was held in St. Louis, Mo., May 16-17, 1946. Walter W. Head of St. Louis, who had served as president for 20 years, retired and Amory Houghton of Corning, N.Y., was elected president. More than 1,000 delegates and friends of scouting participated including

BOY SCOUTS IN CHICAGO pay tribute to Abraham Lincoln during ceremonies in Lincoln park on Feb. 12, 1946

General Joseph W. Stilwell and Fleet Admiral Chester W. Nimitz.

Cub scout activities (for boys 9-11 years old) emphasized skills and fun around the home under the leadership of "Den Mothers" and "Den Chiefs" (older scouts); boy scouts (boys 12 years and older) camped in great numbers as troops under troop leaders. There was an extraordinary gain in the number of Negro boys who had the opportunity to come into scouting. Senior scouting (for young men 15 years and older) attracted a large number either as air scouts, explorer scouts or sea scouts. The new scout unit, the senior scout outfit, made it possible for a young man to follow any or all of the scout programs.

A National Scout Round-Up was held in the fall months giving opportunity to thousands of non-scouts to come into scouting.

In addition to troop camps, scouts conducted trail building camps, especially in Wisconsin, and wilderness camping expeditions; sea scout cruises were held; Philmont Boy Scout ranch attracted experienced campers for wilderness camping; an important feature was instruction in air scouting given by officers in the army air corps to air scouts with opportunity for flying.

In addition to civic service many scout units put over post-war service projects at the request of the government. These included collections of needed clothing and materials, distribution of government informational material, and raising victory gardens to help the food situation.

The theme of 1946 was "Scouts of the World Building Together." In February the "Shirts Off Our Backs" campaign resulted in hundreds of cases of good used uniforms and

equipment being sent to scouts abroad. Through the World Friendship fund contributed by scouts a special badge was manufactured and sent to scouts abroad whose badges had been destroyed during the war; two books published by Lord Robert Baden-Powell, founder of scouting, *Aids to Scoutmastership* and *Scouting for Boys*, were printed and distributed to scouts abroad. The Sixth World Jamboree was scheduled to be held in France in the summer of 1947 together with the International Conference of Scout Leaders.

There was an increase in membership over the previous year. As of Nov. 30, 1946, the membership was as follows:

Total Boys	1,499,184
Total Leaders	493,186
Total Membership	1,992,370
Total Units	64,080

(L. W. BA.)

Braden, Spruille (1894—), U.S. diplomat and statesman, was born March 13 in Elkhorn, Mont. He was graduated from the Sheffield Scientific school at Yale university in 1914 with a degree in mining engineering. Braden, whose father had founded the Braden Copper company which had interests in North and South America, worked in executive positions in mining in South America. After World War I, he was financial adviser to several South American governments. He entered the diplomatic service in 1933 as delegate to the Inter-American Conference of American States in Montevideo. Later he was ambassador to Colombia and ambassador to Cuba.

In May 1945 Braden was named by President Truman as U.S. ambassador to Argentina. After assuming his post, Braden denounced fascism and actively campaigned for establishment of democracy in Argentina. Braden's activities were resented by Col. Juan Domingo Perón, who criticized what he termed U.S. "meddling" in the internal policies of Argentina.

In Aug. 1945, Truman announced Braden's appointment as assistant secretary of state in charge of American republic affairs. Approval of his appointment was delayed because of charges made by some congressmen that Braden was "interfering" in Argentine affairs and demands for his ouster were made by pro-Perón factions in congress, but his confirmation was unanimously approved by the senate on Oct. 22, 1945. Throughout 1946 Braden continued his vigorous attacks on what he termed dictatorships of both the right and left in South America. On Nov. 29, 1946, the state department announced that Braden had the entire confidence of both President Truman and Secretary James F. Byrnes and that he would remain in his post.

Bradley, Omar Nelson (1893—), U.S. army officer, was born in Clark, Mo., on Feb. 12. He was graduated from the U.S. Military academy in 1915 and later from the Infantry school, the Command and General Staff school and the Army War college. Early in 1941 he was commandant of the Infantry school, and in Feb. 1943 he was sent to North Africa where he assumed command of the 2nd corps, which he led to victory at Tunis and Bizerte. In Jan. 1944 Gen. Dwight D. Eisenhower disclosed that Bradley had been made commanding general of the U.S. ground forces for the invasion of Europe. When the invasion started, June 6, Bradley headed the U.S. 12th army group. On Aug. 30 it was disclosed that Gen. Bradley had been given equal status with Gen. Bernard L. Montgomery. The U.S. armies under Bradley's command hammered their way into the Siegfried line by the winter of 1944. After recovering from the nazi counterblow in the Ardennes forest, Bradley's forces overran a large part of the reich by the close of the war in Europe. He was made a

full general (temporary) on March 13, 1945, and was named (June 7, 1945) by Pres. Truman as administrator of veterans' affairs. The following September, he announced plans to overhaul the veterans' service. In early 1946, John Stelle, national commander of the American Legion, attacked Bradley's administration. The general, who received the full support of the president, later accused Stelle of obstructionism and misrepresentation.

Bragdon, Claude (1866–1946), U.S. architect, was born on Aug. 1 in Oberlin, O. He practised his profession in Rochester, N.Y., from 1901 to 1923 and during that time designed railroad stations in the United States and Canada, as well as churches, public buildings and art galleries. His plan of the New York Central railroad station in Rochester was considered one of his finest works. In 1923, he began designing sets for plays and in 1935 lectured on architecture at Princeton university. In addition, he was one of the country's leading experimenters in "colour music." His use of light and colour to reflect the mood of music was first demonstrated with considerable success at the community singing festivals in Rochester known as "Song and Light." A mystic and theosophist, he wrote several books outlining his beliefs, and he aided in the translation and was publisher of *Tertium Organum* by the Russian author Ouspensky, whose views, he said, correlated his own. Several of Bragdon's books were translated into Japanese, Russian and Italian. His works include *The Beautiful Necessity* (1910), *Four-Dimensional Vistas* (1916), *Architecture and Democracy* (1918) and *More Lives Than One*, an autobiography (1938). He died in New York city on Sept. 17.

Brazil. The second largest nation of the western hemisphere and the most populous of Latin America; language: Portuguese; religion: predominantly Roman Catholic, with about 1,000,000 Protestants (including their families) of various denominations; capital: Rio de Janeiro (1945 pop. estimated at 1,951,900); president: José Linhares, former chief justice, until Jan. 31, 1946; from then on, Gen. Eurico Gaspar Dutra.

Brazil has an area of 3,286,170 sq.mi., second only to that of Canada in the western hemisphere. The country is divided into 20 states, a federal district and 5 territories (under provision of the Additional act to the 1946 constitution), including the island of Fernando de Noronha, 225 mi. off the northeastern coast.

The population (1940 census: 41,565,083) was officially estimated at 45,300,000 as of Jan. 1, 1945. Of the population 22% was classified as urban, 9% as suburban and 69% as rural. The capital, Rio de Janeiro (coterminous with the federal district), is the largest city of Brazil.

History.—The principal event in the political history of Brazil during 1946 was the return of the country to a constitutional and democratic form of government. The provisional government of José Linhares came to an end with the inauguration of Gen. Eurico Gaspar Dutra (Jan. 31), elected by a large majority of popular votes in the general elections of Dec. 2, 1945.

In early February the national congress met in the capital, and constituted itself at once into a constituent assembly for the specific purpose of adopting a new constitution, the preliminary draft of which was approved June 1 and, after the adoption of a number of amendments, solemnly promulgated on Sept. 18.

In general, the 1946 constitution is more liberal and democratic than the 1937 charter. It provides for a legislative power exercised by a national congress composed of two houses, a federal senate and a federal chamber of deputies. During the interval between legislative sessions a permanent commission was to exercise certain legislative powers. The senators are elected for an eight-year period, and the deputies for a four-

year period. Members of congress are elected by equal, direct, compulsory and secret suffrage under a system of proportional representation. The president and the vice-president are elected simultaneously and directly by the people. They hold office for five years. The president may not be elected to the presidency within five years after the expiration of his term of office.

The judiciary is composed of a federal supreme court, federal courts of appeals, judges and federal military courts, judges and electoral courts and judges and labour courts.

Each state was to be governed under the constitution which it adopts, within the framework of the federal constitution. Municipalities would be organized as autonomous administrative units.

One of the important innovations of the new constitution is section three, on social rights, empowering the federal government to create state-owned monopolies in the public interest. The government was specifically authorized to suppress any economic organization, group, company or individual firm regardless of its nature which endeavoured to dominate internal markets, eliminate competitors or exploit consumers through price control or any other activity. The government was also authorized to proceed with the nationalization of banks and insurance and investment companies.

The nationalization of public utilities was to be regulated by law. Mines and subsoil resources, as well as waterfalls, constitute property distinct from the soil for the purpose of exploitation or industrial use. Their exploitation was declared to be dependent on federal authorization or concession. Such concession would be granted only to Brazilians or to firms organized in Brazil. The constitution also provided that 3% of the federal revenues during the following 20 years was to be spent to develop the Amazon region.

The new constitution also authorized the government to intervene in labour disputes, although it recognized the general principle of freedom of association and the right to strike, with certain limitations as might be deemed necessary in the public interest. Labour courts were to be created for the solution of controversies between workers and employers. The ownership of journalistic enterprises and broadcasting stations was prohibited to corporations with to-the-bearer shares and to foreigners.

The constitution provided that a minimum of 10% of federal revenues should be devoted to public education. The states

VIEW OF THE VOLTA REDONDA STEEL PLANT in Brazil, about 150 mi. from Rio de Janeiro. The plant went into operation in June 1946

were to devote at least 20% of their revenues to the same purpose.

The Communists under the able leadership of Luiz Carlos Prestes were the only party opposed to the adoption of the new constitution. Claiming a membership which grew within about a year from 4,000 to 130,000, they were probably the most politically aggressive and well-organized party of Brazil.

There were altogether 13 political parties recognized by the national electoral tribunal. The most important were: the Social Democratic party (conservative, the majority party); the National Democratic union (chief opposition party); the Communist party of Brazil (declared legal only a few months before the Dec. 1945 elections) and the Brazilian Labour party (of which former president Getulio Vargas was honorary president).

The day after the promulgation of the new constitution the constituent assembly elected Sen. Nereu Ramos to the position of vice-president and returned to its congressional status as divided into senate and chamber of deputies.

Worthy of note was also the return in August from exile in Portugal (from 1939) of Plinio Salgado, former leader of the Integralist party (fascist) declared illegal by Vargas. The Integralists organized themselves as a new political party (Party

of Popular Representation) duly registered under the existing laws.

Internationally, Brazil was elected to fill one of the non-permanent seats in the Security Council of the United Nations. As one of the nations which signed the terms of surrender of the axis powers in Europe, Brazil participated in the Paris peace conference, representing the Latin American points of view.

Relations of Brazil with the United States continued most cordial despite bitter attacks on the part of the Brazilian Communist press against what it called "American imperialism." A possible cause of friction between the two countries, the return of the air and naval bases constructed during World War II along the Brazilian coast with the assistance of the United States, was removed by the withdrawal of U.S. personnel as soon as circumstances and technical requirements allowed. With other American nations Brazil maintained friendly relations. At the end of the year an Argentine-Brazilian trade agreement was signed in Buenos Aires.

Education.—The constitution of 1946 contained a clause (article 168) which provided that primary instruction was to be obligatory in Brazil and should be given in the national language (Portuguese) only.

The new constitution also provided that official primary instruction should be free for all and that official instruction beyond primary should be gratuitous for those who proved lack or insufficiency of means. It was also provided that industrial, commercial and agricultural enterprises in which more than 100 persons worked would be obliged to maintain free primary instruction for employees and their children.

Religious instruction was to constitute a discipline in the regular schedule of official schools.

According to official data, there were 49,607 primary, secondary and specialized schools at the end of 1942, with 128,871 teachers and a registration of 3,834,515 students. At the end of 1944 it was estimated that there were about 40,000 schools, with about 3,710,000 students. Of these schools, 39,000 were elementary and the remainder secondary, vocational and universities. There were seven official universities, all of them state institutions except the University of Brazil (Rio de Janeiro) which was maintained by the federal government. There were also several independent state schools of law, medicine and engineering. A Catholic university was established in the city of São Paulo in Aug. 1946. During the year the University of São Paulo received from the Rockefeller foundation a \$75,000 grant for research in nuclear physics.

Finance.—The cruzeiro continued the monetary unit of Brazil. It is divided into 100 centavos (cents). The official rate of exchange was abolished on July 22, 1946. The selling rate in the free market fell to 19.53 cruzeiros per U.S. dollar. The rate was further reduced on July 3 (to 18.96 cruzeiros per dollar) and in August it was again reduced to 18.72 cruzeiros per dollar.

The government's expenditures for 1946 were estimated at Cr.\$9,281,789,968 and revenues at Cr.\$10,010,148,000. According to the latest Brazilian treasury reports available, as of Sept. 30, 1946, there existed in circulation Cr.\$19,741,664,213 in paper currency, which represented an increase of Cr.\$422,637,473 over the amount outstanding on Aug. 31. The president of the Bank of Brazil warned the nation that it faced an economic crash unless the government were to take emergency anti-inflation measures. Among the measures taken by the government to cope with the situation was the formulation of a project to reform the national banking system with a view to regulate the national currency and credit as well as to develop the national economy by means of a group of semi-official banks.

At the end of the year negotiations were initiated in London with British authorities to obtain the liquidation of the favourable balance of blocked sterling accrued to Brazil during World War II. The amount of the credits and deposits was estimated at about £50,000,000. The amount of gold and foreign balances accumulated by Brazil in the United States was estimated at \$645,000,000.

During the year the United States Export-Import bank opened a credit of \$50,000,000 in favour of Brazil for the purchase of railroad materials; other smaller credits were announced later for the purchase of locomotives

BALL OF CRUDE RUBBER from the Amazon forests of Brazil being cut at a factory near Belém in 1946. Stones or pieces of metal are removed, the quality is determined and the crude rubber is then washed, rolled into sheets and shipped to the markets

and aeroplanes.

U.S. direct investments in Brazil were estimated at \$337,242,028 in 1943 and British investments at \$951,063,396.

Trade and Communications.—During the first seven months of 1946 Brazil exported merchandise valued at Cr.\$9,840,260,000. In the entire year of 1945 Brazilian exports totalled Cr.\$12,197,510,000. Imports increased with the cessation of hostilities. For the first seven months of 1946 Brazil imported goods amounting to Cr.\$6,693,813,000. In 1945 (entire year) Brazilian imports amounted to Cr.\$8,617,320,000.

The increase in the favourable balance of trade contributed to the inflationary trends. The cost of living increased in some cases as much as 30% after 1940, in itself a year of very high cost of living.

Five countries absorbed more than 70% of the Brazilian exports: the United States 44%; Argentina 9%; Great Britain 9%; China 5% and Italy 3.5%. About 87.5% of Brazil's imports came from the following five countries: United States 66.5%; Argentina 8%; Great Britain 7%; Sweden 3% and Netherlands West Indies 3%. The value of Brazil's purchases from the United States during the first six months of 1946 was estimated at Cr.\$3,727,347,000 (\$186,367,350 U.S. currency) and the value of Brazil's sales to the United States totalled Cr.\$3,553,899,000 (\$117,694,950 U.S. currency).

Brazil's imports from the other Latin American countries decreased in tonnage from 1,047,921 in 1945 to 318,861 tons in 1946 and in value from \$72,128,100 to \$32,150,100 U.S. currency. At the same time Brazil's exports to those countries rose from the 1945 total of 318,572 tons to 437,725 tons in 1946. The value of these exports was \$66,997,950 in 1945 and \$71,592,100 U.S. currency in 1946. The principal customers of Brazil in Latin America were: Argentina, Uruguay, Venezuela, Chile and Colombia.

Trade with Europe also increased about 30% in 1946 as compared with 16.16% of total Brazilian trade with those countries in 1945.

The government took measures in August to protect home consumption by placing embargoes on many exports of prime necessity and lifting the duties on many imports of similar goods.

Trade relations with Argentina were expected to improve in consequence of an agreement signed between Brazil and that country in October (to go into effect in Jan. 1947), under which Argentina was to supply at least 1,200,000 tons of wheat per year to Brazil and the latter promised Argentina the sale of 5,000 truck and 40,000 automobile tires. From 1948 to 1951 Argentina guaranteed to purchase in Brazil such tires as it would need which could not be supplied by Argentine industry, and Brazil promised to sell to Argentina all tires which were exportable surplus. Brazil further promised to assure the sale of cotton textiles of the same quality as usually furnished Argentina during the period of 1940-45.

During the first ten months of 1946 Brazil exported 12,971,367 bags of coffee (132 lb.) as against a total of 10,816,458 bags in the corresponding period of 1945. Prices were also better. In the first ten months of 1945 coffee shipments brought in Cr.\$3,092,670,000 whereas during an equivalent period in 1946 Brazilian coffee exports produced Cr.\$5,135,184,000. The increase was mostly because of improved conditions in Europe. The shipments of Brazilian coffee to the United States in 1946 were about the same as in 1945. But during the first ten months of 1946, Europe bought from Brazil 215,000 bags of 132 lb.

On Aug. 21 the governments of the United States and Brazil signed an agreement on coffee prices and supplies whereby the United States promised to take immediate steps to increase green coffee prices 8.32 cents per pound after its arrival at dock in New York. This increase was in addition to a ceiling price established in Dec. 27, 1941. In return, Brazil agreed not to alter its exchange rates in any way as to

increase the cost of coffee to the buyer nor otherwise restrict the flow of coffee toward the United States.

It was estimated that the yield of coffee in Brazil during the 1946-47 crop would be about 14,500,000 bags of 132 lb. Domestic consumption was estimated at about 5,000,000 bags.

Brazil abolished the National Department of Coffee in August. This department had assumed the control of prices and production for a number of years.

An experimental export of cattle from Brazil to Mexico during the year was somewhat of a disappointment when an epidemic of hoof and mouth disease among Mexican herds was attributed to infection by contact with bulls imported from Brazil.

Transportation problems continued to hinder the economic progress of Brazil. The government asked for a loan of between \$350,000,000 and \$400,000,000 from the Export-Import bank for the development of the national transportation system. The bank agreed to lend Brazil \$50,000,000 but it was suggested that the remainder be borrowed from the International bank.

The railroads of Brazil (about 22,000 mi. in operation) were in urgent need of repairing. From 1942 the principal railroad of Brazil, the Central do Brasil, had been pushing its lines northward intending ultimately to provide through rail connection between the north and the south of the country. Announcement was made in the latter part of the year that the Central do Brasil had completed its part and all that remained to connect Bahia with the south was the balance of a stretch of 250 km., on which work was being pushed by the National Railroad department.

The government took over the British owned São Paulo Railway Co. on the expiration of the concession. This railway was only 60 mi. long but was considered one of the world's richest lines, carrying most of São Paulo's coffee to the port of Santos. There were about 38,000 mi. of surface roads and 124,000 mi. of common roads in 1945.

In 1944 seven aviation companies operated in Brazil with a total of about 116,000 km. routes. The planes of these companies transported about 44,000 passengers, more than 4,000,000 kg. of baggage, more than 774,000 kg. of mail and more than 3,469,000 kg. of freight. The first plane of a regular Rio-Rome line landed in the Italian capital's airport on Sept. 6. This service was undertaken by a Brazilian company and trips on reciprocal basis with Italy were planned with stops in Rio, Recife, Dakar, Lisbon and Rome. Another Brazilian company, Aerovias Brasil, established a new transport service between Rio, São Paulo and Buenos Aires.

In September a new air agreement between the United States and Brazil was announced. Under its provisions, U.S. aviation companies were assured three routes in Brazil, including a new and short one over central Brazil. In return, Brazil was allowed to operate into Miami, New York, New Orleans and even Chicago.

Agriculture.—In 1943 (last nearly-normal year for Brazilian agriculture), about 13,833,365 ha. were under cultivation. In that year the following areas were devoted to the principal crops: corn 4,266,211 ha. coffee 2,490,855 ha.; cotton 2,413,562 ha.; rice 1,171,755 ha. and beans 1,036,069 ha. In 1942 the total Brazilian production of corn was about 86,000,000 bags of 60 kg. each. Minas Gerais, Rio Grande do Sul and São Paulo were the largest producers of corn, accounting for two-thirds of the total.

Coffee continued to be one of the most important export crops. Total production in the 1945-46 crop was estimated at 14,500,000 bags of 132 lb. each.

The livestock production continued high, although beef production declined because of transportation difficulties. Brazil produced 2,675,000 bales of cotton in 1944. Other important agricultural products were: cacao, sugar, coconuts, rubber, timber, fruits, nuts, oleaginous seeds, babassu, carnauba wax.

Manufacturing.—The industrialization of the country continued at a

very rapid pace in 1946. The industrial employment had jumped about 240% in 15 years. São Paulo led the rest of Brazil in industrial plants, with 11,557 units where 369,070 workers produced \$444,450,000 U.S. currency worth of goods annually. Rio de Janeiro came second with 4,323 plants, 150,600 workers and a yearly production of about \$312,750,000 U.S. currency. The total annual industrial output of Brazil was estimated at about \$1,125,000,000 U.S. currency. São Paulo's industrial plants employed 43.1% of Brazil's industrial labour and had 38.2% of all plants and 39.4% of production value.

The first production of steel on a regular scale at Volta Redonda, the big steel mill under construction for several years, took place at 11 A.M. on June 23. The output of steel in Volta Redonda was at the rate of about 300,000 tons yearly.

Firestone Tire Co., through its Brazilian branch at Santo André, state of São Paulo, produced its millionth tire in 1946. The factory was geared to produce about 104,000 tires per year. The National Motor Factory of Brazil received an order for 10,000 refrigerator motors in 1946 from U.S. industries.

The first aviation motor manufactured in Brazil was tried out in flight with satisfactory results on Aug. 20, near Rio de Janeiro.

Mineral Resources.—The output of coal was estimated at 1,958,909 tons during the first quarter of 1945, valued at more than Cr.\$210,000,000 (\$10,000,000 U.S. currency).

Prospecting for oil was carried to the states of Paraná, Sergipe and Pará under government auspices. The total amount produced in the entire year of 1945 was 79,500 bbl. of 42 gal. each. Many wells were shut because of insufficient refining facilities. The National Petroleum council estimated that with additional drilling in proven areas and with full production from complete wells, about 2,500 bbl. per day could be produced.

The existing refineries were owned by the Brazilian government and operated by the council. During 1945, 79,500 bbl. of crude oil were produced and the following products manufactured: gasoline 15,900 bbl.; kerosene 7,950 bbl.; gas oil 15,900 bbl.; lubricating oils stock 19,875 bbl.; paraffin 15,900 bbl. and coal (bottoms) 3,975 bbl. (See also ARGENTINA.) (R. d'E.)

*The Territories of Iguaçu and Ponta Porã were abolished, and their areas reintegrated into the states from which they were originally detached, under the terms of the Additional Act to the 1946 Constitution.

marked by the full impact of the postwar task of feeding hungry people throughout the world, and the demand for wheat for this purpose.

In every country governments gave prime consideration to methods for conservation and equitable distribution of flour and bread, and the United Nations Relief and Rehabilitation administration marked wheat as the basic food for relief feeding purposes.

In the United States the department of agriculture required, beginning March 1, 1946, that millers produce not less than 80 lb. of flour from each 100 lb. of wheat which was ground. Such flour, called 80% extraction, in contrast to the normal extraction rate of 72% or lower, introduced problems both to millers and bakers.

Baking practices required adjustment in order to handle the new type of flour and considerable ingenuity was brought to bear to produce loaves of good eating quality.

The purpose of the order requiring the longer extraction of flour was to conserve wheat, but the initial effect seemed to be to divert wheat to animal feeds to replace the milling products that were produced in lesser amounts as a result of the order. The United States government was then obliged to restrict the utilization of wheat and flour in order to meet commitments for export of wheat to Europe and Asia.

By the end of the summer the crisis had passed and, on Sept. 1, the 80% extraction requirement was removed and, shortly thereafter, the restrictions on the amount of flour a baker could use were eliminated.

During the months the wheat and flour orders of the government were in effect the baking industry co-operated fully with the spirit and letter of the orders. Further, the enrichment program was maintained even though confusion of ideas about the nutritive value of the 80% extraction flour had led some persons into thinking that such flour was equivalent to enriched flour in nutritive value. Instead, analyses showed that 80% extraction flour and bread had much less thiamin, riboflavin, niacin and iron than the enriched products which had been in production from early in 1943.

After the wheat crop was harvested there was a gradual withdrawal of numerous other government restrictions affecting the baking industry, notably the regulations controlling the price of bakery products and the requirement that all white bread and rolls be enriched to meet standards for thiamin, riboflavin, niacin and iron. The baking industry, through its national organizations, urged bakers to continue the enrichment of their products even though it was on a voluntary basis. In many of the states legislation requiring the enrichment of all commercially produced bread and rolls was on the statutes, New Jersey having enacted such legislation in 1946 to bring the total to 19 states.

In Great Britain the level of extraction of flour was increased to 85% and in most countries on the European continent white bread disappeared because of the need to conserve grain. Bread became rationed in Great Britain, for the first time after the outbreak of World War II, but in the United States reliance was placed on a voluntary system of restriction by consumers, with rationing of flour to bakers for a few months before the new wheat crop was harvested.

While conditions were abnormal the baking industry in the United States, according to unofficial estimates by the industry, had the greatest dollar volume of sales in its history, equal to about \$2,500,000,000. (See also FLOUR.) (F. C. BG.)

Bretton Woods: see BANKING; INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT; INTERNATIONAL MONETARY FUND.

Brewing and Beer. Caught in a wave of record demand for beer and ale in the face of limited allotments of raw materials, brewers in the United States faced unprecedented problems in production and distribution during 1946.

With conditions at the beginning of the year indicating a return to normal production, the industry had to revise its program suddenly when a presidential directive, effective March 1, 1946, restricted brewers to 70% of their 1945 usage of grain. The order, issued as an emergency measure designed to alleviate the world food shortage, not only affected malt, which is the basic ingredient of beer and ale, but also other grains, including corn and rice, used as malt adjuncts. Use of wheat was forbidden entirely.

However, this was not a drastic restriction, inasmuch as wheat is rarely used in brewing. Even in 1945, when some wheat was used to make up for curtailment in permissible use of malt, the amount used by the brewing industry was only 998,000 bu., representing but 8/10,000 of the total U.S. crop for that year.

The restriction also embraced "sugars and syrups," as they are termed in government reports, since nearly all of the types used by brewers are derived from corn and are not to be confused with table types such as cane and beet sugar.

Immediately following the government directive, directors of the United States Brewers foundation met in Chicago and adopted a resolution calling upon all brewers to reduce beer production by 30% so as to maintain quality standards. Sectional meetings of brewers were held throughout the country to endorse this action and put the recommendations into practice.

Since demand for beer and ale was at least 25% greater than it was in the previous year, the actual beverage shortage brought about by the reduced allotments of grain was estimated by brewing authorities at about 50%.

Some relief for the industry's production problem was made when, on Oct. 21, the grain restriction was modified, retroactive to Sept. 1, permitting brewers to use 90% of the quantity of grains used in 1945.

Because of favourable conditions in the grain supply situation, the government made a further liberalization of restrictions on brewers' use of grains on Dec. 1. The amended order authorized brewers to use in the three-month quota period be-

BEER KEGS, USED DURING WORLD WAR II to save shipping space, piled up at a brewery in Milwaukee, Wis., in 1946 because of the increased production of bottled beer

ginning Dec. 1, 1946, an amount of grain equal to 100% of their use in the corresponding quota period of the previous year. Wheat and table rice remained prohibited.

Expiration of the OPA act early in July prompted the foundation to act again in the public interest by urging, in telegrams sent to brewers throughout the country, that the price line be held, adding, "We should do our part to prevent inflation. We recommend that you so advise your wholesalers and retailers."

Beer for Military Needs.—During World War II brewers had been required, by government order, to set aside 15% of their grains for the production of 3.2 beer for the use of the armed forces. (This is very slightly lower than the alcoholic content for the national average of beer, which is about 3.4% by weight). The set-aside was ordered after it had been established by service authorities that beer had been a valuable aid to morale and substantially contributed to the army's sobriety. With the gradual return of a large number of the military to civilian life, this set-aside was reduced to 5% on Dec. 1, 1945, to 4% on June 13, 1946, and 3% on Sept. 1, thus releasing more beer for domestic markets. Another reason for the reduction in military requirements abroad was that some of the beer required for overseas was being supplied by breweries in occupied lands, requisitioned and manned by U.S. troops and civilian aides.

By-Products.—Unlike other food industries which draw upon the farms for their source of ingredients, the brewing industry extracts only a portion of the total nutrients contained in the raw materials. It returns the remaining constituents—estimated at 35% of the original total—to the farmer in the form of feed-stuffs containing most of the proteins in the original grain. These by-products are residual grains, which consist of wet and dried brewers' grains recovered from the brewing process and are considered excellent protein supplements for dairy cattle, and brewers' yeast. The latter, a by-product of the brewing process, had been supplied in increasing quantity during the years 1942-46 both as a human nutrient supplement and as a protein and vitamin supplementary feed for livestock and poultry to provide a balanced ration.

It is the richest known natural source of vitamins of the B complex and contains between 40% and 50% of high-grade protein.

Moderation and Law Enforcement.—Close co-operation between brewers, wholesalers and retailers fortified the effectiveness of the self-regulation program, one of the continuing projects of the industry which won wide attention from other fields and public commendation from enforcement authorities. Designed to promote moderation and sobriety and to maintain wholesome, orderly conditions wherever malt beverages are sold, the program utilizes trained investigators to observe the conduct of retail beer outlets and to report to law-enforcement authorities those licensees who fail to correct law violations after warnings.

Statistical reports show that approximately 95% of the retail beer licensees investigated in an average year approach the high standards set for the industry.

Sales Records.—Following are the sales records in U.S. barrels (31 gal.) by fiscal years ending June 30: 1933 (85 days), 6,277,728; 1934, 32,266,039; 1935, 42,228,831; 1936, 48,759,840; 1937, 55,391,960; 1938, 53,926,018; 1939, 51,816,874; 1940, 53,014,230; 1941, 52,799,181; 1942, 60,856,219; 1943, 68,636,434; 1944, 76,969,764; 1945, 79,590,598; 1946 (official but not audited), 80,735,720.

Taxes.—Federal excise and special taxes on beer for the fiscal year 1946 totalled \$653,949,192, bringing the cumulative total after relegalization in 1933 to \$4,773,609,185. State and local taxes and licence fees in 1946 were estimated at \$175,000,000,

raising the cumulative figure for that revenue to about \$1,695,000,000.

From April 7, 1933, the date of relegalization, the combined public revenues from beer approximated \$6,468,000,000. Beer was in 1946 taxed at \$8 per barrel, contrasted with the tax rate of \$1 per barrel from 1902 to 1914. There were no state taxes before prohibition. (See also LIQUORS, ALCOHOLIC.)

*Railroad bridge.

†Not standing.

Plans were completed in 1946 for a new Tacoma Narrows bridge, Tacoma, Wash. (of 2,800-ft. main span), to cost \$9,000,000, using the piers of the original \$6,000,000 structure which was dramatically destroyed by aerodynamic oscillations on Nov. 7, 1940, four months after its opening. The new design, based on a 4-year wind tunnel study on a scale model 100 ft. long, was to be 50% heavier than its predecessor and would use stiffening trusses 33 ft. deep instead of the 8-ft. plate girders of the original structure. Open steel floor gratings were to be used to relieve aerodynamic action.

The Bronx-Whitestone bridge, New York city, with a main span of 2,300 ft., was modified and strengthened in 1946, at a cost of \$1,300,000, by adding stiffening trusses 14 ft. deep on top of the 11-ft. stiffening girders, together with other measures for curbing the aerodynamic oscillations.

Studies of the aerodynamic oscillations of the Golden Gate bridge at San Francisco, Calif. (the world's longest span) were made in 1945-46 by means of ten vibration recording instruments placed at distributed points on the main and side spans.

In 1946 official studies were instituted for the construction of a second bridge across San Francisco bay. The Transbay bridge (San Francisco-Oakland, Calif.), completed in 1936 at a cost of \$78,000,000, was approaching its rated capacity traffic of 80,000 vehicles per day after only 10 years of operation, and the bonds were to be retired in 1952 instead of in 1976, as originally contemplated. As the bridge generated new traffic, the toll rates had been progressively reduced from 65 to 25 cents. To protect the steel members of the Transbay bridge from corrosion, a zinc coat 1/100-in. thick was applied (1946) to 1,300 sq. ft. of the structure exposed to salt spray. A patented "gun" sprays the fused metal on the bare steel surface. The treatment was said to last eight or nine years, as compared with three years for ordinary paint applications, but was found disappointing after a few months' exposure.

In England, a suspension bridge planned (1946) across Milford Haven, Pembroke, was to have a main span of 1,000 ft., with clear height of 120 ft., to cost \$4,500,000. The British government also announced plans for a new suspension bridge, to be the largest in Europe, to be erected across the lower

reaches of the River Severn (near Bristol, England, and Chepstow, Wales). The bridge was to have a main span of 3,000 ft. between towers 450 ft. high, and 2 side spans of 1,000 ft. each. The vertical clearance for shipping would be 110 ft. above high water near the towers and 120 ft. in the centre. When completed, the bridge would have 4 traffic lanes, providing a capacity of 4,000 vehicles per hour. The cost of the project was estimated at £7,500,000 (\$30,000,000).

The traffic capacity of the \$60,000,000 George Washington bridge over the Hudson river at New York city was enlarged to 8 lanes in 1946 by completing the 2 centre lanes which were left as an opening in the floor when the bridge was opened in 1931.

To replace the old steel arch bridge over the Rhine at Duesseldorf, Germany, built in 1898 and demolished in World War II, a multiple-span suspension design was adopted (1946) with 4 main spans of 312 ft. utilizing the existing piers together with new intermediate piers. Horizontal tie cables between the tower tops were to be used to yield stiffness with economy.

Designs, surveys and test borings were commenced in 1946 for a bridge across the strait of Canso, between the mainland of Nova Scotia, Canada, and Cape Breton Island.

The first suspension bridge west of the Mississippi, the Bidwell Bar bridge of 240-ft. span over the Feather river near Oroville, Calif., built as a toll bridge in 1889, was to be retired from service in 1947. The wire cables were still in sound condition after 90 years.

The world's outstanding suspension bridges in 1946 are listed in Table II.

Table II.—Longest Suspension Spans

Year	Bridge	Location	Span
1937	Golden Gate	San Francisco	4,200 ft.
1931	George Washington	New York	3,500
1936	Transbay	San Francisco	2,310
1939	Bronx-Whitestone	New York	2,300
1929	Ambassador	Detroit	1,850
1926	Delaware river	Philadelphia	1,750
1924	Bear Mountain	Hudson river	1,632
1903	Williamsburg	New York	1,600
1883	Brooklyn	New York	1,595½
1938	Lion's Gate	Vancouver, B.C.	1,550
1930	Mid-Hudson	Poughkeepsie	1,500
1909	Manhattan	New York	1,470
1936	Triborough	New York	1,380
1931	St. Johns	Portland, Ore.	1,207
1929	Mount Hope	Rhode Island	1,200
1926	*Florianópolis	Brazil	1,114
1939	Deer Isle	Maine	1,080

*Eyebar chain.

The bridge at Nijmegen (Netherlands) over the Waal river, completed in 1939, is a 2-hinged steel arch of 790 ft. span, making it the longest-span arch in Europe. An ingenious erection method was used for raising the segments of the arch truss, utilizing for temporary support the trusses fabricated for another bridge. This bridge became famous when it was captured undamaged by the British and U.S. airborne army which landed at Nijmegen in 1944.

A new bridge built in 1945 over the Seine at Neuilly has a steel arch span of 269 ft., the longest welded arch span in the world. The structure replaced Jean Rodolphe Perronet's bridge of stone arches built in 1768–80.

Completed in 1943 despite great difficulties, the Queen Alexandrine bridge in Denmark, spanning the wide sound between Seeland and Moen, is a high-level structure 2,440 ft. long, consisting of a 390-ft. steel arch flanked on each side by 5 arches of reinforced concrete.

The new Skanstullsbron bridge, carrying southbound traffic out of Stockholm, Sweden, was completed in 1946, after 4 years of construction work, at a cost of \$5,130,000. The central steel arch and the flanking spans of concrete and steel form a structure 1,875 ft. long and 86 ft. wide, carrying a 4-lane motor highway, a railroad track and pedestrian traffic.

The Eads bridge over the Mississippi river at St. Louis, Mo., a double-deck railroad and highway structure of 3 steel arches of 502 ft., 520 ft. and 502 ft., completed in 1874, was modernized in 1946 with a new upper (highway) deck. The old timber and steel-framed deck was replaced with a concrete-filled, shallow I-beam grating on new steel cross beams, to provide a 40-ft. roadway and 2 sidewalks, while reducing the dead load by 800 pounds per ft. of bridge.

The world's longest steel arch spans in 1946 are listed in Table III.

Table III.—Greatest Steel Arch Spans

Year	Bridge	Location	Span
1931	Kill Van Kull	New York	1,652 ft.
1932	Sydney harbour	Australia	1,650
1935	Birchenough	Southern Rhodesia	1,080
1917	Hell Gate arch	New York	977½
1941	*Rainbow	Niagara Falls	950
1936	*Henry Hudson	New York	800
1939	Waal river	Nijmegen, Netherlands	790

*Hingeless arch.

The largest bridge under construction in the United States in 1945–47 was the Memphis bridge over the Mississippi, a 4-lane highway cantilever structure, 3,695 ft. long, costing \$10,500,000. The channel span is 790 ft. For constructing the deep piers, the caissons were sunk by open dredging but were convertible to pneumatic working chambers if required. The caissons were floated out to the site and then sunk through willow mats previously placed to receive them.

The Cooper river bridge at Charleston, S.C., with cantilever spans of 1,050 ft. and 640 ft., built in 1929, had a 240-ft. section of its approach spans demolished by a ship collision in 1946. For the emergency temporary repairs, resourceful use was made of the Bailey trusses that had been developed and applied in World War II for military bridging.

The once-famous Red Rock cantilever bridge of 660-ft. span over the Colorado river at Topock, Ariz., built in 1890 and strengthened in 1910 by building a concrete pier under the middle of the suspended span, was converted in 1946 from an abandoned railroad bridge to highway use by redecking for automobile traffic.

The world's largest cantilever bridges in 1946 are listed in Table IV.

Table IV.—Longest Cantilever Spans

Year	Bridge	Location	Span
1917	*Quebec	St. Lawrence river	1,800 ft.
1889	*Forth	Scotland	1,700
1943	Howrah	India	1,500
1936	Transbay	San Francisco	1,400
1930	Longview	Columbia river	1,200
1909	Queensboro	New York	1,182
1927	Carquinez strait	California	1,100
1930	Harbour bridge	Montreal	1,097
1929	Cooper river	Charleston, S.C.	1,050
1940	Story bridge	Queensland	924

*Railroad bridge.

The Chester (Illinois) bridge over the Mississippi river, a continuous truss highway bridge with two spans of 670 ft., originally built in 1940 and destroyed by being blown off its piers during a violent windstorm in 1942, was replaced by a new structure in 1946 of the same type and span length using the existing main piers.

Clay's Ferry bridge, over the Kentucky river south of Lexington, Ky., officially opened to traffic in 1946, was the highest bridge east of the Mississippi and the highest of its kind in the United States. The structure consists of a 3-span continuous deck-type steel truss (with spans of 320 ft., 448 ft. and 320 ft.) flanked by simple truss spans and concrete girder spans, and carries the highway 250 ft. above the river. The highest main pier is 198 ft. high. It replaced an old timber and iron bridge which was built in 1869 as a private turnpike bridge, operated at a loss for many years, sold at public auction in 1906 for

SKILLED WORKMEN giving a coat of paint to the George Washington bridge over the Hudson river at New York city during 1946. The job was expected to take about four years and to require 30,000 gal. of paint

\$4,755, thereafter yielding a net income (from tolls) of \$30,000 a year and purchased in 1929 for \$200,000 by the state of Kentucky, which collected the purchase price from tolls in 20 months and tore down the toll gates.

Construction of an \$11,000,000 steel bridge across the mouth of Tampa bay at St. Petersburg, Fla., was planned to start early in 1947. The project comprises 9 mi. of embankment and 3 mi. of open trestle bridges, including one continuous truss span of 800 ft.

The world's outstanding continuous truss bridges in 1946 are listed in Table V.

Table V.—Longest Continuous Truss Spans

Year	Bridge	Location	Span
1942	Dubuque	Mississippi river	845 ft.
1944	St. Louis county	Mississippi river	804
1917	*Sciotoville	Ohio river	775
1929	Chain of Rocks	Mississippi river	699
1929	*Cincinnati	Ohio river	675
1928	Cape Girardeau	Mississippi river	672
1946	Chester	Mississippi river	670
1930	Quincy	Mississippi river	628
1934	Bourne	Cape Cod canal	616
1935	Sagamore	Cape Cod canal	616

*Railroad bridge.

For improving the inner harbour of Cleveland, O., work was commenced in 1946 on the replacement of six narrow railroad bridges and the rebuilding of another. The cost of \$13,250,000 was to be shared by the railroads and the federal government.

A spectacular fire, originating in the wooden floor of the 45-year-old Alexandra bridge (railroad and highway) connecting Ottawa, Ont., and Hull, Que., destroyed a considerable part of the bridge (1946).

To replace the several wrecked bridges over the Rhine at Cologne, Germany, a substantial temporary crossing was built in 1946 by British royal engineers and German contractors. The structure consists of a central 240-ft. truss span, flanked by shorter Bailey spans.

The world's longest simple truss spans in 1946 are listed in Table VI.

Table VI.—Longest Simple Truss Spans

Year	Bridge	Location	Span
1917	*Metropolis	Ohio river	720 ft.
1929	Paducah	Ohio river	716
1922	Tanana river	Alaska	700
1911	*Douglas MacArthur	St. Louis	668
1933	*Henderson	Ohio river	665
1919	*Louisville	Ohio river	644

*Railway bridge.

The first bridge span constructed entirely of structural aluminum, a deck plate-girder span of 100 ft., was built in 1946 over the Grasse river at Massena, N.Y., to carry E-60 railroad loading. The complete span weighs only 53,000 lb. Almost identical steel spans in the same bridge weigh 128,000 lb.

The longest welded continuous girder bridge built up to 1946 was the St. Rose bridge, north of Montreal, constructed in 1945-46. It is 1,500 ft. long, comprising 14 girder spans, 90 to 126 ft. long, in one continuous construction, with expansion at the end abutments only.

A new bridge over the Anacostia river on South Capitol street in Washington, D.C., commenced in 1946, was of plate girder type, with a main crossing 854 ft. long, to cost \$4,500,000. The planned replacement of the Fourteenth street highway bridge over the Potomac was to cost \$7,000,000.

Construction of the North State street bridge and the South Canal street bridge, both over the Chicago river, Chicago, Ill., interrupted by World War II, was resumed in 1946. Both are double-leaf trunnion bascule bridges. The North State street bridge is of 245-ft. span, 108 ft. wide, each leaf weighing 4,200 tons.

Traffic over the Lake Washington concrete pontoon bridge at Seattle, Wash., continued to exceed all estimates, amounting to 2,250,000 automobiles, trucks and busses in 1945, so that it was thought the \$5,900,000 bonded debt might be retired in 1952 instead of 1968, as originally planned.

Collapse of two spans of a bridge over the Manasquan river, near Brielle, N.J., in 1946 was attributed to attack of the foundation piles by teredos.

On June 15, 1946, King Gustav V of Sweden and King Haakon VII of Norway formally opened the Svinesund bridge

over the Idefjord river on the main highway connecting the two countries near Oslo. This international bridge was started and nearly completed just prior to World War II. The main span is a 509-ft. concrete arch (the sixth largest in the world), flanked by arcades of shorter spans, carrying the roadway 270 ft. above the water.

A novel design, using a reinforced concrete rigid frame of 266-ft. span instead of an arch, was adopted (1945-46) for a large flume crossing of the Crooked river, near Bend, Oregon.

In the United States, despite shortages of materials, equipment and manpower, and the steeply rising construction cost, bridge construction took a decided upswing after the halt during World War II. Total bridge construction placed under contract was \$53,000,000 in 1945 and \$90,000,000 in 1946. (See also **ROADS AND HIGHWAYS**.)

The longest existing spans on the respective continents in 1946 are listed in Table VII.

Table VII.—Longest Spans on the Respective Continents

Continent	Bridge	Location	Year	Type	Span
North America	Golden Gate	San Francisco	1937	Suspension	4,200 ft.
Europe	Forth	Scotland	1889	Cantilever	1,700
Australia	Sydney harbour	New South Wales	1932	Steel arch	1,650
Asia	Howrah	India	1943	Cantilever	1,500
South America	Florianópolis	Brazil	1926	Suspension	1,114
Africa	Birchenough	Southern Rhodesia	1935	Steel arch	1,080

(D. B. S.)

Bridgman, Percy Williams (1882—), U.S. physicist, was born April 21, at Cambridge, Mass. A student at Harvard university, he received his A.B., A.M., and Ph.D. degrees there (1904, 1905 and 1908) and remained with that institution as fellow (1908-10); later he became professor of physics, mathematics and natural philosophy. A fellow of the American Academy of Arts and Sciences and a member of the National Academy of Sciences, Dr. Bridgman is an authority on high pressures. He invented apparatus which helped him in the study of physical effects of high pressures and among other discoveries was credited with being the first to produce dry ice. He also did research on the electrical conduction in metals and the properties of crystals. In 1927, he wrote his first book, *The Logic of Modern Physics*. Although a nonnuclear physicist, he was regarded as one of the scientists connected with the discovery of the atomic bomb; however, the nature of his work during World War II was never disclosed. The recipient of numerous scientific awards, Dr. Bridgman was given the Nobel prize for physics on Nov. 14, 1946.

Briquettes, Fuel: see FUEL BRIQUETTES.

British Borneo: see BORNEO.

British Columbia. British Columbia is the third largest and most westerly of the nine provinces comprising the Dominion of Canada. The crown colonies of Vancouver Island (1849) and of British Columbia (1858), after uniting in 1866, became the sixth province to enter the Canadian confederation on July 20, 1871. Occupying an area of 366,255 sq.mi., of which 6,976 sq.mi. are water, the province is bounded on the west by the Pacific ocean, on the south by the states of Washington and Montana, on the east by the Province of Alberta, and on the north by Alaska, Yukon and the Northwest Territories.

The population, on June 1, 1946, was estimated to be 960,000 (1941 census, 817,861); approximately 70% (1941, 599,783) of whom were residents of the southwestern corner—the lower Fraser valley and Vancouver Island regions. The principal ports of Greater Vancouver (1941, 351,491), Greater Victoria (75,218), the capital, and New Westminster (21,967) are located

in the southwest corner. Urban dwellers numbered 443,394, rural dwellers 374,467; the bulk of the population (558,085) was reported to be of English, Irish or Scottish descent; other European races numbered 175,512; there were 42,472 persons of Asiatic descent; and native Indians numbered 24,875.

History.—In the first session of the 21st legislative assembly (Feb. 21, 1946–April 11, 1946) John Hart, premier and minister of finance reported: revenue of \$40,813,808 collected during the fiscal year ended March 31, 1945, had exceeded ordinary expenditures of \$33,908,889 by \$6,904,919; (\$1 Canadian=\$1 U.S. in 1946); the net public debt on Dec. 31, 1945, was \$132,160,430; anticipated revenues were \$42,152,387 and expenditures \$42,089,508 for the fiscal year 1946-47. Measures passed by the assembly included: creation of a one-man milk board, with jurisdiction over the marketing of milk; the Consumer Credit act, authorizing the government to introduce regulations covering consumer credit and instalment buying, when federal war-time regulations were withdrawn; the Public Schools Amendment act—following the recommendations of the Maxwell-Cameron report—provided for the consolidation of school districts into 74 large administrative areas, the levy of a uniform tax of 5 mills on real estate, and provincial grants-in-aid; legislation permitting the government to increase its advance to the British Columbia Power commission from \$10,000,000 to \$20,000,000; authorized the government to borrow \$500,000 for the purpose of making grants to municipalities which, under the National Housing act, had arranged to acquire lands suitable for low-cost rental housing projects; empowered the government to replace the existing 7 cents tax on gasoline used by private vehicles with a 10 cent tax—this statute anticipated a 3 cent reduction, expected about April 1947 in the federal war-time gasoline tax; the Hours of Work Amendment act established the maximum number of working hours a week at 44, in place of the former 48 hour maximum; the Annual Holidays act, requires nearly every employer to provide each employee with at least one week's holiday with pay per year (280 working days); other legislation created a new department of health and welfare from branches of the department of the provincial secretary; the Constitution Act Amendment act, increased the sessional allowance payable to each member of the legislative assembly from \$2,000 to \$3,000.

Lumber operations in the forests and in the mills came to a halt between May 15 and June 26, as the result of an industry-wide strike of the International Woodworkers of America. In June, survey parties began field studies of potential routes for an extension of the Pacific Great Eastern railway from Prince George to Dawson Creek. The P.G.E. railway was also given motor transport privileges over the unfinished Peace River highway. Provincial minimum wage scales were raised about 30%, also in June. In July, the Milk board came into being and provincial price regulations were imposed in the Lower Fraser valley and Victoria regions. On Oct. 1 Charles A. Banks succeeded Lt. Col. W. C. Woodward as lieutenant governor of British Columbia. C. H. Locke, K.C., was retained as counsel by the provincial government in Oct. to oppose the application of the Railway Association of Canada for a 30% increase in railway freight rates.

In Dec. Premier Hart reported verbally the culmination of protracted negotiations with the dominion government. Under a contemplated 5-year tax agreement, April 1, 1947–March 31, 1952, the province would vacate temporarily the income tax, corporation taxes and succession duty fields; as compensation the dominion would pay an annual subsidy to the province of not less than \$18,072,000; based on 1942, this annual subsidy would change with population and gross national production per capita. The dominion also indicated its intention to withdraw

its wartime tax of three cents per gallon on gasoline in favour of a provincial levy. This tax agreement was to be submitted for ratification to the legislative assembly in the spring of 1947.

At the close of 1946, members of the provincial executive council, or cabinet, and their portfolios were: John Hart, premier and president of executive council; H. Anscomb, finance; G. S. Pearson, provincial secretary, labour, health and welfare; E. C. Carson, public works; E. T. Kenney, lands and forests; G. M. Weir, education; F. Putnam, agriculture; G. S. Wismer, K.C., attorney general; R. C. MacDonald, mines, municipal affairs; L. H. Eyres, railways, trade and industry, fisheries.

Education.—During the school year ending June 30, 1945, 125,135 students were enrolled: in the elementary (83,773), junior high (16,577), superior (3,361) and high (21,424) schools of the province. Teaching staffs comprised 2,744 teachers in elementary, 542 in the junior high and 1,068 teachers in superior and high schools.

Communications.—While new construction was proceeding, provincial highways were maintained at their 1944 level; the total mileage as of March 31, 1944, excluding the Alaska highway, amounted to 21,946 mi., of which 9,529 mi. were surfaced; 9,842 mi. were improved earth; 2,575 mi. were unimproved earth roads. Construction of the new 250-mi. Peace River highway—Prince George to Dawson Creek, and of the 81-mi. Hope-Princeton highway moved forward during the year; in addition some 170 mi. of highway were given bituminous surface.

Railway mileage, in 1944, amounted to 3,857 mi. of single track. In the same year, the total number of telephones, 173,011, included 57,149 on automatic switchboards.

Manufacturing, Agriculture, Mineral Production.—Preliminary provincial estimates indicated that the net value of production in the primary industries, during 1946, surpassed that of the previous year except in the case of fisheries; the details were: \$108,000,000 in agriculture (1945, \$103,387,000); \$40,-

way freight loaded, index of employment and salaries and wages paid revealed declines from their 1945 levels.

(G. N. P.)

British East Africa. Under this heading are grouped British colonial territories on the east coast of Africa, of which certain essential statistics are given in the table. See BRITISH EMPIRE for area, population, capital towns, status and governors. (See also RHODESIA, NORTHERN AND SOUTHERN.)

History.—During 1946 the major occupation of the governments of the East African territories was the change-over from war to peace, and the implementation of plans which had been under consideration from 1943. Demobilization of the forces affected some 100,000 natives of Kenya; 90,000 of Tanganyika; 70,000 of Uganda; and 30,000 of Nyasaland—plans for training men for civilian work had been prepared as well as schemes for rehabilitating and caring for the disabled. The wartime regulation which permitted the conscription of native labourers for essential war work and production was rescinded, and the last of the conscripts, who served for periods of from 2 to 15 months, was discharged in September. During the period of the regulation some 80,000 natives of Tanganyika and 60,000 of Kenya had been conscripted. Most of the 70,000 prisoners of war who had been sent to the territories were repatriated. A contingent from East Africa command including representatives of all territories went to Great Britain to take part in the victory parade in June, and the band of the King's African Rifles played in the marching column. The strength of the African forces in the territories was fixed at 8,000; the prewar strength was less than 1,500.

Plans for reconstruction covering periods of five or ten years were prepared by the governments. Grants from the British treasury under the Colonial Development and Welfare act, 1945, together with increased taxation and in some cases local loans, were to be devoted to education, health, soil conservation, agriculture, housing, communications and water supplies, for the greater part in the native interest. Very large sums were required in addition to the grants, and Sir Wilfrid Woods, who visited the territories during the year in order to make a fiscal survey, reported that for the next five years annual expenditure from revenue would be £6,333,000 in Kenya; £4,000,000 in Tanganyika; and £3,250,000 in Uganda. At the opening of the budget session of the legislative council at Dar es Salaam on Dec. 2, the governor announced that a ten-year plan had been drawn up for Tanganyika at an estimated cost of £18,000,000.

Private enterprise also played its part. In Kenya European settlement was to be increased by 500 new farmers at a cost of £1,600,000, to be raised by local loans. A wattle-producing project which aimed at securing exports worth £1,000,000 within 15 years was also initiated. In Tanganyika two major mineral developments were underway. At Shinyanga a diamond pipe believed to be the largest in the world was discovered. At Mpanda enormous deposits of lead and other minerals were found and the government proposed to build a railway to the area costing £1,000,000. In the same territory, a groundnut mission sent out by the British government reported favourably on large production schemes.

Industrial development, which under the stimulus of war made some headway, showed only moderate prospects in peacetime. The most promising industries were those of building materials and ceramics. An expert in the latter industry was engaged in research in the territories. Import quotas remained in force.

Immigration by non-natives, controlled throughout the war, was made the subject of regulations. Minimum capital requirements of would-be immigrants were fixed at £800 for farmers,

Economic Activity in British Columbia, 1944-46

	Unit	1944	1945	1946 Preliminary Estimates
AGRICULTURE:				
Total value of production	\$	97,737,916	103,387,000	108,000,000
Livestock	\$	11,139,000	13,052,000	12,500,000

£1,000 for miners, £2,500 for traders and £10,000 (or a lesser sum as the governor might direct) for industrialists. The measure was nonracial.

Tanganyika was placed under United Nations trusteeship by the British government which had previously held the territory under mandate from the League of Nations. A continuance of British administration was a condition of the agreement. Former axis estates were taken over by the government and made available for settlement.

The labour adviser to the colonial office visited the East African territories to study labour problems. In his report he stated that the average native worked only 25 hr. per week. Reasons suggested were malnutrition, lack of incentive and the scarcity of consumer goods in the shops. The secretary of state for the colonies visited Kenya, Tanganyika, Uganda and Zanzibar in July and August, when he was undersecretary, to study problems on the spot and to meet leaders from all communities.

Regular air services were increased during the year and were expected to reach six per week in each direction before the end

of the year. The motor vessel "Vipya," the new £60,000 ship owned by Nyasaland railways, sank in a storm in Lake Nyasa a few weeks after its maiden trip, with a loss of 145 lives.

In Uganda plans were made for extending the university college at Makerere to full university status. In British Somaliland the schools at Sheik were completed and a large clinic was built at Hargeisa.

A woman was appointed as a member of the Nyasaland legislative council for the first time.

The Aga Khan celebrated his diamond jubilee at Dar es Salaam by being weighed against diamonds by his followers. The value of the stones was £350,000.

Tsetse fly still infested two-thirds of Tanganyika, one-third of Uganda and one-seventh of Kenya. Experiments in the destruction of the pest with DDT were being carried out.

(G. R. MN.)

British Empire. The governments of the British Empire and the governors and premiers were as follows on Dec. 31, 1946:

British Empire				Status	Rulers, Governors and Premiers

British Guiana. A British crown colony in northeastern South America. Area: 89,480 sq.mi.; pop. (1931 census): 310,933; pop. est. (1943): 364,694. Racial groups in the population include 159,249 East Indians, 135,364 Negroes, 9,419 aborigines, 8,361 Portuguese, and 3,557 Chinese (1943 est.). The capital and principal city is Georgetown (1943 pop. est., 73,171, of whom only about 1,400 were white). The only other important town is New Amsterdam (pop., 10,525). Executive power is vested in a governor and commander in chief, assisted by an executive council and a legislative council. Governors and commanders in chief in 1946: Sir Gordon James Lethem, until Nov. 7; Sir Charles Woolley, following that date.

History.—The Bermuda aviation conference, held at Hamilton early in 1946, approved the use of a British Guiana aero-

plane base, along with three other United States wartime-constructed bases, for civil aviation. The United States, which following 1940 had developed its aviation facilities in British Guiana on an important scale, took steps early in 1946 to negotiate an enlargement of its lease in British Guiana, especially for use for bomber training. Delegates from British Guiana attended the second Caribbean conference, held in the U.S. Virgin Islands in Feb.–March, 1946. Although problems of overpopulation in Barbados, Puerto Rico, and other Caribbean possessions were considered by the conference, the meeting focused attention on the underpopulation of British Guiana and recommended a study of it. Gov. Lethem subsequently expressed great hopes of developing the hinterland and took steps to initiate preparation of a ten-year plan for colonial development,

emphasizing the problems of the interior. The legislature late in 1946 passed a slum-clearance bill.

Education and Religion.—The government operates about 250 schools with more than 60,000 pupils enrolled. The total government grant for education in 1943 was £140,584. The government in 1946, as part of an educational expansion program, made an appropriation of £26,050 for teachers' housing. Literacy is estimated at 70%. The government in 1946 tabled a motion approving participation by the colony in the proposed West Indian university to be organized in Jamaica. The principal churches in British Guiana are the Anglican and Roman Catholic.

Finance.—The monetary unit is the British Guiana dollar, tied to the pound sterling at 4s. 2d. and valued at about 84 cents U.S. The colony was much interested in the possibility, frequently discussed in 1946, of establishing a dollar currency unit common to the eastern group of British West Indian colonies and including British Guiana; no definitive steps had been taken toward that goal by the end of 1946, however. Total 1945 revenues (estimated) were \$11,181,939 and expenditures \$12,142,332; the actual 1945 deficit was about \$2,700,000. The 1946 budget involved expenditures of \$13,539,414 and anticipated revenues of \$10,647,299, leaving a prospective deficit of \$2,892,215. The colonial treasury accumulated a wartime emergency surplus which, it was hoped, might cover the 1945, 1946 and 1947 deficits. The legislative council early in 1946 approved allocations of \$500,000 for development and welfare projects. The British government, under its Colonial Development and Welfare act of 1940, and supplementary laws, allocated \$12,000,000 during 1946 for projects in British Guiana, to be expended in instalments. Long-range plans covering a period of 20 years contemplated an expenditure of \$108,000,000 for a wide variety of projects. The popular reaction, however, was that such a sum would be insufficient for that long a period and it was unofficially proposed that a supplementary loan of \$50,000,000 should be raised privately for development of the colony.

Trade and Communication.—Chief exports are sugar, bauxite, rice, gold, rum and balata; the principal imports are machinery, wheat and flour, textiles and clothing. Sugar exports for the first quarter of 1946 were 47,284 long tons (same period in 1945: 44,481 tons) valued at \$3,750,747 (1945: \$3,120,476). Rice exports for the first quarter of 1946 were 6,601 long tons (same period in 1945: 7,800 tons). Diamond exports in the first quarter of 1946 were 5,087 carats (same period in 1945: 3,949 carats) valued at \$277,008 (1945: \$105,228). Exports of bauxite in 1945 were 739,000 long tons (1944: 873,968 tons) valued at \$3,660,637 (1944: \$5,411,976). Crude rubber exports in 1945 were 250,256 lb. (1944: 288,570 lb.), all of which went to the United States. Balata exports in 1945 were 646,580 lb. (1944: 984,274 lb.), most of which went to the United Kingdom. Sugar exports in 1945 were 132,576 long tons valued at \$9,677,647. Diamond exports in 1945 were 17,251 carats (1944: 13,911 carats) valued at \$513,677 (1944: \$327,310). Molasses exports in 1945 were 1,415,827 gal. (1944: 1,664,421 gal.) valued at \$142,264 (1944: \$130,408). A committee of the rice marketing board toured the West Indies in 1940 seeking additional markets for British Guiana's production.

Railway and highway mileage are respectively about 110 and 500, the latter figure not including about 200 mi. of secondary forest roads. A road-building program extending over several years at an estimated cost of \$17,000,000 was under consideration in 1946.

Agriculture.—Production of sugar in 1945 totalled 158,445 long tons (1944: 138,472 tons); the acreage was 58,000 (1944: 59,000). The government in 1946 created a permanent organization for the purchase, distribution, and export of rice. Forestry

experts undertook an extensive survey of timber resources, estimating them at 41,000,000,000 cu.ft. of merchantable timber, including 7,000,000,000 ft. of greenheart, 28,000,000,000 ft. of other hardwoods, and 6,000,000,000 ft. of lightwoods; the potential annual production was estimated at 240,000,000 cu.ft. and possible royalties at \$7,264,000. A Belgian concern was granted a concession to cut 120,000 ft. of lumber monthly.

Manufacturing and Mining.—Industrial experts made a favourable report on the possibilities of a glass industry, proposing the annual manufacture of 18,000,000 bottles and a capital investment of \$600,000; samples of glass sands were sent to England for experimental manufacture. Authorities also studied the possibility of establishing a wallaba wood pulp and plywood industry; its export potential was estimated at \$1,400,000 annually.

Oil exploration was abandoned during 1946. Geologists estimated the colony to contain 250,000,000,000 tons of high-grade silica reserves and vast deposits of kaolin.

British Honduras. A British crown colony on the Caribbean side of Central America, bounded on the north, east, and south and west, respectively, by the Yucatan peninsula, the Caribbean sea and Guatemala. Area (including about 212 sq.mi. of cays): 8,598 sq.mi.; the area is technically in doubt because of the existence of a claim by Guatemala to a large part of southern British Honduras. Pop. (1944 est.): 63,390. The population is approximately 50% Negro and mestizo and 25% Indian; white population is estimated at less than 2,500. The capital and principal port is Belize (or Belice; pop., 1946 est., 18,188); other towns (with est. pop.) include Stann Creek (2,844), Corozal (2,197), El Cayo (1,500), and Benque Viejo (1,500). English is the main language but many speak Spanish and some Maya. Governors in 1946: Sir John Adams Hunter, to July 1; A. N. Wolffsohn (acting), July 1–Nov. 26; Edward Gerald Hawkesworth.

History.—The long-standing boundary dispute with Guatemala took a new turn in 1946. The Guatemalan foreign minister on Sept. 24, 1945, proposed the reopening of the question, after it had been held in abeyance during World War II, and the British foreign office replied in a note dated Jan. 14, 1946, proposing that the controversy be referred to the International Court of Justice as soon as it should be organized by the United Nations. Guatemala two days later consented to this suggestion. The origin of the dispute dates back to an allegedly unfulfilled treaty of 1859. The colony sent delegates to the second Caribbean conference, held in the U.S. Virgin Islands beginning Feb. 21, 1946. Discussion continued in the colony in 1946 of the possibility of federation with other British Caribbean colonies.

Education.—Primary education is provided by 112 schools, 78 of which are government-aided denominational schools; they had a 1943 enrolment of 11,798, with an average attendance of 81%. Government expenditures on education in 1943 totalled \$130,249. A colonial development and welfare grant £6,680 has been allocated to reconstruction of school buildings destroyed in the northern district of the colony by a hurricane in 1942. A new primary school curriculum, approved in 1945, began to be applied in 1946. A U.S. system of teacher training, especially for rural areas, was further extended in 1946.

Finance.—The monetary unit is the British Honduras dollar, theoretically equal to the U.S. dollar, but restricted in circulation to British Honduras and pegged in practice to the pound sterling. The colonial debt at the beginning of 1944 was \$2,291,161. Sinking funds totalled \$531,730 and total liabilities

were \$1,252,992; the treasury surplus at that time was \$113,972. The second British colonial development and welfare act (1945) made available for British Honduran projects approximately £600,000 to be spent over a ten-year period. The cost-of-living index in April 1946 was 167 as against 100 in 1939.

Trade and Communication.—Mahogany export, formerly the basis of British Honduran trade, had slumped greatly, and in 1946 the government was studying the possibility of exporting other hardwoods in larger quantities.

Highway mileage includes 131 mi. of asphalt and improved earth roads and 97 mi. of nonsurfaced roads. The 1946 budget included items of \$230,000 and \$104,500, respectively, for road construction and maintenance; the most ambitious construction project was the road from Belize to Corozal in the north.

Agriculture.—Despite the statement of Gov. Hunter early in 1946 that the colony's future was bound up with its timber resources, British agricultural experts who surveyed the problems of the colony emphasized the great need for a more diversified agriculture. Prospects appeared poor in 1946 but the government began a program to stimulate production of rice, corn, beans and fats. (See also GUATEMALA.)

British Legion. At its annual conference held in London at Whitsuntide 1946 the British legion celebrated its silver jubilee, on which it was congratulated by the king. Major General Sir F. Maurice was elected president, Brigadier General Sir E. R. Fitzpatrick chairman of the national executive council and Colonel Lord Cromwell treasurer, in succession to Major General Sir Brunel Cohen who had held the position for 25 years. The legion decided to contribute to the solution of the housing problem by voting a further £100,000 for the existing Haig homes, specially adapted for the disabled, and by establishing 7 homes for convalescent and other ex-servicemen in various parts of the country. The first of these, Maurice house, Westgate-on-Sea, was opened in June; the second, Churchill house, Sevenoaks, was opened by Mrs. Winston Churchill on Oct. 12. This house was presented by Charles Hopkins to Mrs. Churchill as a tribute to her husband, and was entrusted by him to the British legion to be used for convalescent ex-servicemen. The remaining four houses were in preparation. Other noteworthy events in the year were the opening of treatment centres for men suffering from rheumatic complaints, paralysis or neurosis; the Poppy day collection (Nov. 11, 1945) for the first time exceeded £1,000,000 and a record number of prince of Wales pensions were issued. in South Africa, of which certain essential statistics are given in the table. See BRITISH EMPIRE for population, capital towns and status. High commissioner: Sir Evelyn Baring. For other territories of the British empire in South Africa see SOUTH AFRICA, THE UNION OF.

History.—The three South African territories of Bechuanaland, Basutoland and Swaziland entered into an important stage in their development as British protectorates. The effect of the sum of £2,500,000 set aside in 1945 by the London colonial office for their internal advancement was in 1946 beginning to make itself felt, particularly with regard to the fight against soil erosion. This coincided with the return of almost 35,000 demobilized men who voluntarily fought with the United Nations in North Africa and beyond. They had acquired a new outlook and knowledge of the higher living standard abroad, of the importance of sufficient food and a well-balanced diet and of cars, engines, mechanical instruments, etc.; their experience was expected to benefit their own tribes who had in the past suffered from the lack of an artisan class.

The future of the railway running through Bechuanaland came under discussion. In June 1945 Sir Harold Howitt was asked by the dominion secretary in London to investigate "whether it would be in the interests of Northern Rhodesia and the Bechuanaland protectorate" if this railroad were acquired by Bechuanaland and the two Rhodesias. While he thought a decision ought to be deferred until 1950 he was of the opinion that such a transfer into public ownership was bound to come. Viewing the nationalization program of the British Labour government, such transfer, if it came, would deeply affect the economic progress of the native population; it would also draw attention to the fact that neither Basutoland nor Swaziland had any proper railroad connection. Basutoland, following the example set by Bechuanaland under Sir Arden Clarke, took a step towards fuller self-government by introducing native treasuries (as from April 1, 1946) which, under a national native treasury at Matsieng, were responsible for tax collection. This involved the introduction of salaries for all chiefs, beginning with the paramount chief Mantsebo Seeiso at £3,600 per annum, and the salutary reduction in the number of native courts from 1,340 to 117. Externally the main attention, as always, was directed towards the aims of the Union of South Africa. On April 29, 1946, Chief Tshekedi, whose people hold about one-half of Bechuanaland, led a protest by all the chiefs of the territory against the proposed transfer of the mandated territory of south-west Africa to the Union. They asked that Britain itself take over the mandate, thus to safeguard their natural outlet to the Atlantic; failing this they demanded a transfer of the mandate to the United Nations. (F. W. PK.)

British West Africa. Under this heading are grouped the British colonial territories on the west coast of Africa, for which certain essential statistics are given in the table. See BRITISH EMPIRE for population, capital towns, status and governors.

Central, regional and local planning for political, economic and social development, research and surveys of resources were general in 1946. West Africa was receiving assistance from the colonial development and welfare fund, extended for 10 years from 1945 with a grant of £120,000,000. Regional co-operation was carried on through the West African council which took the place of the resident minister's office; collaboration with adjoining French territories increased. The commission on higher education in West Africa issued a majority report recommending three university colleges and a minority report recommending a unitary university in Nigeria, with territorial colleges doing intermediate work, teacher training and adult education in each territory. The secretary of state supported the minority, but there was strong local opinion in favour of the majority report. A report on recruitment and training for the colonial service recommended equal pay for equal work for colonial and European officers, and outlined extensive courses of training to be given in the universities of Oxford, Cambridge and London. A report on training for European and African nurses included training for community as well as for hospital nursing services. More than 300 West Africans marched in the victory parade in London in June. The arrangement for sending some Africans to Sandhurst to qualify for commissions was to be continued, and rehabilitation centres for former service men were opened in the territories. Trade unions and co-operative societies were developing. Government control of the marketing of cocoa crops continued.

Nigeria.—A new constitution came into effect on Jan. 1, 1947, setting up houses of assembly for north, east and west, regional budgets and representation in the central legislative council of 20 official and 29 unofficial members. A section of African opinion considered the constitution too conservative. A 10-year plan was approved by the legislative council involving expenditure of £55,000,000, for which £23,000,000 was allotted from the colonial development fund. The rest was to be raised by the Nigerian government in part through local loans, the first of which was subscribed two and a half times over the amount asked for, half the individual subscribers being Africans. The plan included extension of health and education services, improvement of economic conditions for the people and development of the agricultural and mineral wealth of the country. A department of commerce and industries was set up for local and export trade. The first of 12 factories for expressing palm oil was in operation. The report of the commission of inquiry on the strike of government technical workers in 1945 provided an analysis of the economic questions underlying the demand for a rise in cost of living allowances and supported certain claims of the workers. A field worker was collecting data on nutrition.

Gold Coast.—In July 1946 the legislative council with an unofficial African majority met under the new constitution. A survey of Ashanti by a group including an anthropologist provided data on land tenure, native authorities and their relation to the central government. The 10-year development plan involved expenditure of £10,000,000. Town planning surveys were

British West Africa

made by an expert serving all four territories, and an industrial development board was set up. In the Northern Territories forest conservation received attention and the timber industry was developing. Data on nutrition were collected; research on "swollen shoot" which menaced the cocoa crops brought some results. An inaugural meeting of the trades union congress was held with 15 unions represented. An officer was appointed for mass education. Some native authorities began to sponsor health services; successful measures were taken to control an outbreak of cerebrospinal meningitis; but the spread of tuberculosis caused concern.

Sierra Leone.—Twelve district councils for the protectorate and a protectorate assembly were established, all with advisory powers. In the colony the Municipalities bill was postponed, as only 170 voters registered. The 10-year plan proposed expenditure of £5,250,000, £2,600,000 to be met from the Colonial Development fund and £1,374,000 from local resources and a loan. Expenditure included agricultural and forestry development. Sawmills were set up and men trained for the timber trade. A deepwater quay was planned at Freetown. Medical and education services were being extended.

Gambia.—The Bathurst town council was constituted with 15 elected members. Nutritional research was carried on. Government agricultural and veterinary services were unified with those of Sierra Leone, to be followed by fishing, printing and possibly police services. The first Gambian administrative officer was serving his probation.

British Togoland and the British Cameroons.—Drafts for placing these territories under the trusteeship council were submitted to the United Nations; they included provision for their continued administration with the Gold Coast and Nigeria respectively, safeguards of the economic interests of the inhabitants and provision for defense. Bromine. After a decline to 32,940 short tons in 1942, bromine production in the United States made a spectacular rise to 47,043 tons in 1943 and to 51,056 tons in 1944. Since more than 90% of the output is used in the production of anti-knock fluid for motor fuel, the increase could be directly attributed to the heavy demand for motor fuels in the war program. The end of the war reduced demand, and the 1945 output dropped to 39,855 tons. Formerly produced en-

tiely as a by-product from well brines used in the production of salt and magnesium chloride, the bulk of the bromine output now comes from sea water which contains only a small fraction of 1% of the element.
(G. A. Ro.)

Brookings Institution: see SOCIETIES AND ASSOCIATIONS.

Broomcorn. The 1946 United States broomcorn crop was estimated by the U.S. department of agriculture at 43,900 tons which was 29% larger than the crop of 1945 and only .8% short of the 1935-44 average of 44,290 tons. The yield was 295 lb. per acre compared with 280 lb. in 1945 and an average of 298 lb. The acreage for harvest was 267,000 ac. compared with 250,000 ac. in 1945 and an average of 300,000 ac. Colorado took first place with 14,600 tons, over Oklahoma with 13,500 tons. Texas produced 5,900 tons; Illinois 3,000; Kansas 2,000 and New Mexico 1,800. These six states produce almost all of the commercial crop though small amounts are grown in other states. The largest increase was in Illinois which increased plantings 76%. Most of the crop was harvested in good condition by Oct. 1.

Brozovich or Broz, Josip (Tito) (1892-), Yugoslav soldier and statesman, was born near Zagreb in Croatia. He served in the Austro-Hungarian armies in World War I and in 1915 went over to the Russians. Returning to Croatia, he became a labour

MARSHAL TITO of Yugoslavia (right) playing a game of chess with Fiorello H. La Guardia, director general of U.N.R.R.A., aboard the former's private train on July 29, 1946, while La Guardia was making an inspection tour of Yugoslavia

leader and communist and assumed the pseudonym Tito. After the Germans overran Yugoslavia in 1941, Tito organized a guerrilla army that soon took the ascendancy over the rival Chetnik forces led by Gen. Draja Mihailovitch, and won Allied recognition. On March 7, 1945, Tito formed a government with himself as premier and in the closing days of the war, his forces occupied Trieste but later withdrew under Allied protest. Tito formally proclaimed (Nov. 29) establishment of a republic. His rule was recognized by Britain and the U.S. Dec. 22, 1945. Throughout 1946, Tito renewed his claims to Trieste. After Yugoslavs shot down two U.S. aircraft over Yugoslavia, the U.S. warned Tito's government (Aug. 21) that unless Yugoslavia made amends for the two incidents, it would take the case up before the U.N. Security council. Tito yielded to the U.S. demands and subsequently paid a \$150,000 indemnity for the lives of five U.S. fliers killed in one of the planes that was shot down. Tito later maintained that the infringement of

Yugoslav territory by U.S. fliers was deliberate. Tito was also involved in a controversy with the Vatican which assailed the conviction of Archbishop Stepinatz of Zagreb on charges of wartime collaboration with the Ustachi. Tito declared, Oct. 31, that he had notified the Vatican to remove Stepinatz before his arrest and charged that his government was deliberately misrepresented by U.S. and British propaganda as a persecutor of the Catholic Church.

Bruce, William Cabell (1860-1946), U.S. senator and author, was born on March 12 at Staunton Hill, Charlotte co., Va. After graduating from the University of Maryland Law school, College Park, Md., in 1882, he set up practice in Baltimore, Md. He later became active in state politics and was elected to the state senate (1894-96). He was head of the law department of the city of Baltimore (1903-08) and general counsel of the Maryland Public Service commission (1910-22 and 1929-35). He was elected on the Democratic ticket to the U.S. senate (1923-29) and there distinguished himself for his independence from party policy. He was an advocate of federal anti-lynching legislation and a vigorous opponent of the Ku Klux Klan. Bruce was one of the leading foes of prohibition, although at first he favoured a system of state control of liquor under federal authority. He was defeated for re-election in 1928 in the Hoover landslide. He was the author of *Benjamin Franklin, Self-Revealed* (1918) for which he received the Pulitzer prize. He also wrote *John Randolph of Roanoke* (1923), *Seven Great Baltimore Lawyers* (1931), *Recollections* (1931), *Imaginary Conversations with Franklin* (1933) and *The Inn of Existence* (1941). He died in Baltimore on May 9.

Brunei: see BORNEO.

Bryn Mawr College. A resident college for women at Bryn Mawr, Pa. In 1946 Bryn Mawr added to its academic program the following courses: general anthropology, ethnology, physical and economic geography, advanced northern Renaissance, history of Russia, Russian literature in translation and intermediate Russian language. The department of history of art introduced a new experimental laboratory in connection with its first year course. The class was held for two hours each week and basic problems of design, form, colour harmony, etc. were studied in a practical manner. Under the Mary Flexner lectureship, Alfred H. Barr, Jr., director of research in painting and sculpture at the Museum of Modern Art in New York city, was in residence at the college for six weeks and gave a series of six illustrated public lectures on "Dogma and Practice in Modern Art." (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (K. E. M.)

Bubonic Plague: see PLAGUE, BUBONIC AND PNEUMONIC.

Buckwheat. The United States buckwheat crop was estimated by the U.S. department of agriculture at 7,105,000 bu. in 1946 compared with 6,644,000 bu. in 1945 and the 10-year average, 1935-44, of 7,138,000 bu. This was nearly 2,000,000 bu. less than the large crop of 1944, of 9,166,000 bu. The acreage for harvest was estimated at 402,000 ac. compared

U.S. Production of Buckwheat in Leading States, 1946 and 1945
(In bushels)

State	1946	1945	State	1946	1945
Pennsylvania . .	2,394,000	2,016,000	Michigan . . .	243,000	350,000
New York . . .	2,147,000	1,519,000	Tennessee . .	165,000	144,000
Minnesota . . .	588,000	630,000	West Virginia .	133,000	172,000
Ohio	340,000	306,000	Maine	120,000	93,000
Wisconsin . . .	266,000	294,000	Maryland . . .	118,000	141,000

with 413,000 ac. in 1945 and an average of 424,000 ac. The reduction in acreage was due to the spring weather being favourable for the planting of other crops for which buckwheat was often a substitute. The average yield was 18.2 bu. per acre in 1946 compared with 16.2 bu. in 1945 and 10.8 bu. for the 10-year average. Pennsylvania and Maryland harvested high yields of 21 bu. per acre, Vermont 19.5 bu., New York 19.5 bu.

(J. C. Ms.)

Budget, National. The president's budget for the fiscal year 1948 was submitted to congress by President Truman on Jan. 10, 1947. Since the president had fully discussed his economic views and program in the *Economic Report to Congress* as required under the Employment act of 1946, the budget message was limited to the justification of the government expenditures and receipts requested by the president.

The budget recommended a level of expenditures for fiscal 1948 of \$37,527,917,000 and revenues of \$37,730,365,000. As expenditures for the preceding fiscal year were estimated at \$42,522,947,000 and revenues at \$40,229,926,000, the budget represented a continuation of the movement of government operations to a peacetime basis. However, since the recommended level of expenditures was so far above the prewar level, the major emphasis in the budget message was given to a full explanation of the government's requirements.

While the total government expenditures were expected to decline by approximately \$5,000,000,000, there was considerable variation in the anticipated outlays for the various governmental functions. The bulk of the curtailment was expected in expenditures for national defense, the recommended figure for 1948 of \$11,587,114,000 contrasting with the previous year's expenditures of \$15,149,457,000. National defense remained by far the largest category in the budget. The president pointed out that expenditures had been reduced drastically from the wartime

"WHO SAYS STATISTICS ARE DULL?" asked Justus of *The Minneapolis Star* in 1946

peak and stated that the ultimate peacetime level of the nation's defense establishment could not be attained in the coming fiscal year. He mentioned the large responsibilities arising out of the war which still remained, including military occupation in

Europe and the far east as well as the necessity of training recruits for replacement. The recommended expenditures provided for an average military strength in 1948 of 1,641,000 officers and men, as compared with a military establishment in the preceding fiscal year of 2,108,000. Approximately 45% of the national defense expenditures were budgeted for pay, subsistence and travel of military personnel. In addition, it was necessary to allow for procurement, research, development, construction, operation and maintenance and citizen-reserve activities.

Outlays for veterans' services and benefits were expected to decline from \$7,601,388,000 in 1947 to \$7,342,771,000 in the coming fiscal year. As with national defense, this budget category was a major factor in the increase of the budget over its prewar level. In 1940 outlays for veterans' services and benefits had been \$551,000,000. The decline in outlays from 1947 to 1948 was largely accounted for by an expected decrease in the number of veterans receiving unemployment and self-employment allowances. In 1947 about 1,100,000 veterans on the average received unemployment benefits while more than 200,000 received self-employment allowances. In the coming fiscal year, it was expected that about 900,000 veterans would receive these allowances, the decline reflecting the high level of general business activity and employment which was anticipated.

On the other hand, the budget allowed for an increase in the number of veterans receiving education and training benefits, from an average of 2,000,000 in 1947 to 2,100,000 in 1948. The cost of this program was estimated at \$2,300,000,000. There was, furthermore, a sharp increase in the number of veterans receiving on-the-job training. Pension payments to disabled veterans and to dependents of veterans were expected to increase in 1948 as were outlays for the construction and operation of veterans' hospitals.

The largest decline among the categories of expenditures was that for the conduct of international affairs and finance. The great responsibilities of the nation in world affairs is indicated by the increase in outlays for this function from \$21,000,000 in 1940 to \$5,637,691,000 in 1947. The allowance in the budget for fiscal year 1948 showed a sharp decline to \$2,820,129,000. This decline in expenditures was accounted for largely by two factors. First was that the nation's contribution to the International Monetary Fund and to the International Bank for Reconstruction and Development had been completed in 1947. The second was the fact that the United Nations Relief and Rehabilitation administration program was coming to an end. Changes in other items were of much smaller magnitude. Expenditures by the war department for administration and relief in the occupied countries were expected to increase as were expenditures for the administration of the state department. On the other hand, a smaller scale of operations of the Export-Import bank was anticipated since the International bank had begun operations.

Governmental functions for social welfare, health and security were the only budget component to show a substantial decline from its prewar level. Outlays of almost \$4,000,000,000 in 1939 had fallen to \$1,569,846,000 in 1947, entirely because of the

virtual elimination of expenditures for work relief and direct relief.

In 1948 outlays were expected to increase slightly to \$1,654,114,000. The president recommended permanent legislation to increase federal grants for public assistance and broadening of the social security program. He recommended that a cabinet department of health, education and social security be created to carry out the functions of the Federal Security agency. He stressed the need for a health insurance program.

Budget expenditures for housing and community facilities were expected to remain approximately the same in 1948 as in 1947. While there was a decline in the outlays under the general accounts of the budget, this was substantially offset by increased operations of government corporations. The president stated that primary reliance would continue to be upon private housing construction. But he felt that government assistance was needed to promote the flow of a few key materials, to aid in recruitment and training of labour and to provide ample financing facilities for both builders and purchasers. The chief aid to private housing in the coming fiscal year was to be provided by the Reconstruction Finance corporation purchases of guaranteed mortgages of veterans. Expenditures on public housing programs were almost entirely restricted to liquidation of war housing activities as provision for emergency housing units for veterans would be completed in the fiscal year 1947. The president recommended that the \$100,000,000 limitation on Reconstruction Finance corporation loans to local agencies for construction of self-liquidating projects be increased to \$125,000,000. He also urged that the general housing bill, previously passed by the senate, be enacted and that a permanent housing agency to supervise the major housing activities of the government be established.

The expenditure estimates for education and general research were limited to present programs. The total of \$88,069,000 for 1948 did not include the education program for veterans which was included under veterans' services and benefits. The largest item was the expenditures of the office of education, most of which are distributed to the states to promote educational activities. Increased outlays were recommended for research programs of the government such as those undertaken by the bureau of the census, bureau of standards and the coast and geodetic survey. The president stressed the need for a central agency to correlate and encourage the research activities of the country and recommended that a national science foundation be established.

Expenditures for aids to agriculture were expected to be little changed from the previous year. There was, however, an increase in outlays for functions concerning other national resources from \$727,275,000 in 1947 to \$1,098,921,000 in 1948. The increase did not contemplate the beginning of large new projects but represented necessary expansions of existing programs. In part, the increase was accounted for by the inclusion of expenditures for the atomic emergency commission and the operation of the Manhattan District project. The expenditures on this project were previously in national defense but were being classified in national resources because of the shift in emphasis to atomic research for industry and medicine. Furthermore, the research program in atomic energy was to be expanded. Construction programs on river valley developments were to be increased, as well as the mineral resources program of the bureau of mines and the geodetic survey.

Increased outlays were anticipated for aids to transportation and communication, with total expenditures in 1948 estimated at \$1,532,911,000. The rapid expansion of civilian aviation required an increase in expenditures by the Civil Aeronautics administration and the federal aid program for highways was expected to reach the levels provided for by the Highway act of 1944.

A large increase in the deficit of the post office was expected because of the rising trend of operating cost. The president recommended revision of postal rates sufficient to wipe out the deficit.

With the elimination of most of the war regulatory agencies, it was expected that outlays for functions relating to finance, commerce and industry would decline from the 1947 level of \$175,886,000 to \$112,326,000. The activities of the Office of Temporary Controls were to be discontinued as rapidly as possible, and the Solid Fuels administration and the Office of Foreign Funds Control were to cease operations. On the other hand, increased costs were expected for such regulatory agencies as the Federal Trade commission, Federal Power commission, the tariff commission, and the antitrust division of the justice department. The president recommended that funds be provided for censuses of manufactures and business and that the business service activities of the commerce department be increased. For the functions relating to labour and general government operations, the estimates were little changed from the preceding year. The small reduction in the cost of operating the public employment offices was virtually offset by increased expenses of the National Labor Relations board and the provision of labour information and statistics.

As the large wartime increase in the public debt was concluded at the end of 1945, there was little change in the budget estimate of interest cost. The estimated expenditure in 1947 of \$4,950,000,000 was expected to increase to \$5,000,000,000 in 1948. The president explained the increase as being due to the larger interest payments on the special issues held by trust funds and the increased accruals on savings bonds. He stated that the annual interest charge of \$5,000,000,000 was less than 3% of the present national income and well within the capacity to pay if a higher national income were maintained. The government's policy of holding interest rates at a low level was to be continued both for economic reasons and to relieve the burden on the taxpayer.

On the revenue side of the budget, a decline in fiscal 1948 to \$37,730,365,000 was anticipated from the level of the previous year of \$40,229,926,000. This decline was attributable to two categories of tax revenues. The elimination of the excess profits tax at the end of 1945 was expected to bring a further decline in direct taxes on corporations of approximately \$1,000,000,000. The elimination of the wartime excise tax rates, which were

due to expire on July 1, 1947, would also reduce government revenues by about \$1,000,000,000. The remaining loss in revenues was due largely to a reduction in sales of surplus property.

In view of the favourable level of business activity, employment and national income, the president recommended that tax revenues be maintained at levels not only high enough to meet current expenditures but to leave a surplus for some retirement of the public debt. He therefore advised strongly against immediate tax reduction. On the contrary, he recommended that the wartime excise tax rates be continued throughout the fiscal year 1948. If this were done, it was estimated that government revenues would be increased to \$38,900,000,000. This would result in a budget surplus of \$1,800,000,000. If the wartime excises were allowed to lapse, the budget surplus would amount to \$202,448,000. As the issue of tax reduction had been raised very prominently in the congressional elections in the fall of 1946, it was evident that this aspect of the president's budget recommendations would be extensively debated by the congress. Congressional leaders expressed themselves as favouring a budget surplus to be applied against the national debt but were hopeful that government expenditures could be reduced below the budget estimates, and hence that some tax reduction could be accomplished. (See also DEBT, NATIONAL; INCOME AND PRODUCT, U.S.; TAXATION; UNITED STATES.)

Great Britain.—The budget of Great Britain for the fiscal year 1946-47 showed a substantial curtailment from the requirements of war time. Expenditures for the military services were expected to fall to £1,667,000,000 from their level of £4,410,000,000 in the previous year. On the other hand, the peacetime operations of the government were expected to increase substantially. On balance, total government expenditures of £3,887,000,000 were anticipated, as against £5,475,000,000 in the fiscal year 1945-46.

The tax revenues of the government were estimated at £2,918,000,000 compared to £3,197,000,000 in the preceding year. The decline resulted from a reduction in income tax rates and reduced receipts from the excess profits tax. While other revenues were expected to increase the total flow of government receipts to £3,161,000,000, a deficit in excess of £700,000,000 was anticipated.

(M. Gr.)

Buell, Raymond Leslie (1896-1946), U.S. editor, writer and educator, was born July 13 in Chicago, Ill. He was educated at Occidental college (Los Angeles), the University of Grenoble (France) and Princeton university. After his return from service with the A.E.F. during World War I, he became assistant professor of history and economics at Occidental college. He subsequently taught at Harvard, Columbia, the University of California, Yale and Princeton and lastly held the post of special lecturer in international politics at the Fletcher School of Law and Diplomacy, located on the campus of Tufts college, Medford, Mass. In 1927, he joined the Foreign Policy association as research director, was named president in 1933, but resigned in 1939 to become round table editor for *Fortune* magazine and adviser on foreign affairs to *Time*, incorporated. A recognized authority on international relations, Buell urged a global policy for the U.S. in the days before World War II. He frequently criticized the government's stand on foreign policy, especially its neutrality policy in Spain, and charged that the Neutrality act virtually made the U.S. "an ally of Japan." He was the author of *Contemporary French Politics* (1920), *The Washington Conference* (1922), *International Relations* (1925), *The Native Problem in Africa*, 2 vols. (1928), *Poland: Key to Europe* (1939) and *Isolated America* (1940). He died in Montreal, Feb. 20.

Building and Construction Industry. The shortage of construction materials in the U.S. continued to impede building in 1946. The demand was greater than the normal supply and in the first half of the year, in most instances, the supply was far below normal for these reasons: (1) war requirements had demanded different specifications and factories had to reconvert to peacetime stocks; (2) they chose to manufacture those supplies which carried the greatest profits and they did not make those items which were less profitable for they could keep their plants busy with the more profitable articles. Nails were in this category and they were not produced until heroic efforts were made; (3) the Office of Price Administration (OPA), trying to avoid inflation, at first refused to make price adjustments which the trade thought necessary. Many price adjustments, when made, were considered too small; (4) strikes kept basic industries like steel idle.

The production pace increased steadily but it did not keep up with demand. OPA efforts to keep a lid on prices met with extensive black-market operations. It was estimated that 75% of building supplies found their way to the black market. In some areas, just prior to the removal of price control on building materials on Nov. 10, 1946, as much as 95% of some materials were in the black market.

Because of the shortage and the dire need of housing for veterans building materials were channelled through priorities away from public, commercial and industrial construction to housing for veterans.

By Oct. 14, 1946, there were 66 building materials on the priority list.

To step up production of materials and construction of houses, congress passed the Veterans Emergency Housing act on May 22, 1946, providing among other things \$400,000,000 for premium payments for scarce materials and market guarantees for new materials and factory-built houses. Premium payment programs to increase the output of brick, structural tile, plywood and gypsum-board paper liner were started in June; for north-

ern and southern hardwood flooring, convactor radiators and cast-iron soil pipes in July; for pig-iron in September; for sand-lime brick and for housing nails in October.

To expedite lumber production the national housing expeditor made \$13,500,000 available to the forest service and to the office of Indian affairs for the construction of access roads to out-of-the-way government timberlands. The funds were expected to build 2,689 mi. of roads and 23 bridges and to increase the lumber output by 452,000,000 bd.ft. in 1946 and an additional 1,615,000,000 in 1947.

Guaranteed market contracts were given for production of "industrialized houses" in October to the Homeola corporation, Chicago, for 19,400 plywood houses with 768 sq.ft. of floor space, costing approximately \$5,400 for one model and \$6,400 for another (including the cost of erection, lot and equipment), and to William H. Harman corporation, Philadelphia, for 10,000 steel houses for 2-bedroom homes selling for around \$6,000 complete with land and equipment and 3-bedroom homes selling for around \$7,500 and to American Fabricators, Louisville, Ky., for 7,500 houses.

In December the General Panel Corp., Los Angeles, was awarded a guarantee for 8,500 factory-built plywood houses to be produced by the end of 1947.

In November Housing Expeditor Wilson Wyatt clashed with the Reconstruction Finance Corp. (RFC) over the financing of new firms desiring to build industrialized houses under a guaranteed contract. The clash, augmented by further differences, led to Wyatt's resignation on Dec. 4, 1946.

As materials became more plentiful, labour shortages impeded building in many parts of the country. National Housing agency reported shortages in at least 80 communities, in spite of the fact that 1,250,000 construction employees were added to the work force in the 12 months following the end of World War II, bringing Aug. 1946 employment to 2,321,000. Site employment on home building rose from 176,000 to 692,000 between Aug. 1945 and Aug. 1946.

*Production data for lumber and hardwood flooring are from U.S. forest service through CPA; data for softwood plywood, warm-air furnaces, domestic cooking stoves, domestic space heaters, asphalt roofing materials, brick, structural tile and clay sewer pipe are from the U.S. bureau of census; data for cast-iron soil pipe, radiation, wire nails, plumbing fixtures, building blocks, gypsum board and lath, other building board, merchant pig iron, galvanized steel sheet and butt-weld steel pipe are from the Civilian Production Administration; data for Portland cement are from the U.S. bureau of mines. Data for wire nails, galvanized steel sheet, butt-welded steel pipe and asphalt roofing represent shipments, rather than production.

NHA Report, vol. I, no. 4.

†Data are preliminary estimates, subject to revision.

‡Data revised upward in accordance with more complete industry coverage; includes CPA estimates for nonreporting producers.

§Revised on basis of more refined data.

||Revised to include production of approximately 80 plants which started operations during the first half of 1946 but which are not included in figures for Jan.-April 1946. May production comparable with earlier data was brick 356.3, and structural tile 93.8. Data for first four months of 1946 are being revised to include the additional plants.

n.a.—Not available.

Table II.—Materials reserved indefinitely for rated orders

(Schedule B to PR 33 as amended Oct. 14, 1946)

These materials of residential type were required by Schedule B to be physically set aside and reserved indefinitely by distributors to honour HH and other rated orders. These reserves could be released by the regional housing expeditors.

Materials	Unit of measurement	Percentage set aside
Bathtubs	By unit	95%
Building board	By sq. ft.	75%
Cast iron soil pipe and fittings (under 5 inches)	By producer's billing price	90%
Clay sewer pipe (4, 5 and 6 inches only) .	By producer's billing price	75%
Gypsum board and lath	By sq. ft.	85%
Doors and frames (metal)	By units	75%
Fittings and trim for bathtubs, kitchen sinks, water closets, lavatories	By sets	"Match up" amounts
Furnaces, floor and wall	By units	95%
Furnaces, warm air	By units	75%
Kitchen sinks and undersink cabinets . . .	By units	75%
Lavatories	By units	90%
Prefabricated housing, sections and panels (not produced under Direction 8 to PR 33)*	By units	100%
Radiation (convector and cast iron) . . .	By sq. ft. of heating surface or producer's billing price for convectors without enclosures	75%
Tubing, copper (types K, L, M, sizes 3/8" to 1" inclusive)	By weight	75%
Tubing (copper) fittings (solder pressure for sizes above)	By producer's billing price	75%
Water closets, tanks and bowls	By units	90%
Water heaters	By units	60%
Window sash and frames (metal)	By units	75%

*That produced under Direction 8 was reserved 100% for HH holders. NHA, New Action to Speed Housing, Oct. 14, 1946.

Construction expenditures for the first 10 months of 1946 totalled \$9,700,000,000, compared with \$4,600,000,000 in the same months of 1945. This figure reflects an expansion in private construction, offsetting the decline in public construction resulting from reductions in military and war plant work and the curtailment of peacetime public works. These high dollar figures were, in part, reflections of high construction costs. Allowances made for price changes placed the physical volume of new construction in 1946 (excluding maintenance and repair) somewhere between that for 1939 and that for 1940 and only 60% of the level of 1942.

Construction expansion ceased after August; construction activity declined slightly in October. Nonresidential building maintained the August high mark but private residential building and repair continued to edge down from the August peak. This may be attributed to the fact that industrial and commercial building previously authorized was getting under way, and the beginning of winter discouraged starting new residential building. But high construction costs, material delays, fear of a buyers' strike and a depression which would suddenly drop prices and leave the builder holding the bag and uncertainties of changing governmental regulations (pending changes in the housing expediter's office) were considered influential factors. (See also BUSINESS REVIEW; HOUSING; UNITED STATES.) (D. R.N.)

Great Britain.—Public preoccupation with the housing problem in 1946 resulted in this section of the work of the building industry being conducted in the full glare of

PREFABRICATED ALUMINUM BUNGALOW section being placed in position in Manchester, Eng., during 1946. This four-room, small-family house came in four sections and could be assembled in 12 hours

publicity, although a large part of the labour force was employed on other work. The experience in the field of housing was, in

†Revised.

‡Data are for all construction workers (contract and force account) actually engaged on new construction, additions, alterations and on repair work of the type usually covered by building permits. (Force-account employees are workers hired directly by the owner and utilized as a separate work force to perform construction work of the type usually chargeable to capital account.) The construction figure included in the bureau's nonagricultural employment series covers only employees of construction contractors and on federal force account and excludes force-account workers of state and local governments, public utilities and private firms.

§Data not available.

¶Includes the following force-account employees hired directly by the federal government and their pay rolls: Aug. 1945, 17,927, \$3,344,967; July 1946, 19,244, \$3,571,294; Aug. 1946, 20,199, \$3,884,140.

¶Includes employment on construction of plants to produce atomic bombs, which, for security reasons, was not previously included in these estimates but was shown in the classification "other," as follows: Aug. 1945, 25,000; July 1946, 2,500; Aug. 1946, 2,500.

¶Excludes pay-roll data for construction of plants to produce atomic bombs.

¶Employees and pay rolls for Defense Plant corporation projects are included, but those for projects financed from RFC loans are excluded. The latter are considered nonfederal projects.

¶Includes central office force of construction contractors, shop employees of special trades contractors, such as bench sheet-metal workers, etc.

¶Data for other types of maintenance not available. Monthly Labor Review vol. 63-No. 4, Oct. 1946.

many respects, typical of that in all fields.

The repair of bomb damage, already in full swing in 1945, gave site work a flying start over all the other occupations concerned with building. It was in this field also that the expansion of the labour force first became effective. In consequence, building operations outran supplies of materials and fittings: by April 1946 site operations were seriously delayed by shortages of all kinds. This slowing down of progress, at a time when it was felt that the drive should have been gathering momentum, caused great disappointment.

In response to public demand and official encouragement, large numbers of houses were started, although it was shown that the ratio of men employed to houses under construction was much too low to permit efficient operation of the schemes. Completion of houses, even in the temporary house program, was very slow and in September it was necessary for the minister of health to direct that, in order to complete as many houses as possible by the end of the year, labour should be concentrated on houses which had already reached a certain stage of completion.

There was much complaint of the low standard of output of the industry and it was generally felt by the end of the year that a reintroduction of a "payment by results" arrangement would

*Estimated construction expenditures represent the monetary value of the volume of work accomplished during a given period of time in the United States. These figures should be differentiated from data on value of construction work started or contracts awarded, reported in the sections on urban building construction and federal construction.

†Revised.

‡Preliminary.

§Estimates of new construction were prepared jointly by the bureau of labor statistics and the bureau of foreign and domestic commerce, and include expenditures for new construction, major additions and alterations.

||Expenditures for floating dry docks and facilities for the production of atomic bombs are excluded.

¶Mainly river, harbour, flood control, reclamation and power projects.

¶Includes water supply, sewage disposal and miscellaneous public-service enterprises.

δCovers privately financed structural repairs of the type for which building permits are generally required.

Source: Construction, Oct. 1946, U.S. Dept. of Labor, Bureau of Labor Statistics.

be necessary. A joint production council for the industry was set up to advise on various aspects of this problem. Progress was also delayed by the absorption of a considerable amount of labour by small repair and maintenance work, for which there was a large demand after seven years of neglect. Jobs costing more than £10 (\$40) required a licence; it was suggested that means were being found to circumvent this restriction and there was much talk of a "black market" in building, although relatively few prosecutions were reported.

The ministry of works continued to advise in connection with the development of constructional technique, particularly for

HOUSES IN VARIOUS STAGES OF CONSTRUCTION near San Francisco, Calif., in early 1946. Mass-produced by a process called "site fabrication," all the parts for the houses were fashioned by a sawmill set up on or near the site

houses, and several prefabrication systems for permanent houses, having successfully passed through the prototype stage, were allowed to go into production during the year. (D. A. G. R.)

Bulgaria. A people's republic in the Balkan peninsula. In 1940 its area was 39,814 sq.mi. with a population of about 6,370,000. Of the territories acquired after then, only the southern Dobruja, ceded on Sept. 7, 1940, from Rumania, an area of c. 2,900 sq.mi., with a population of 350,000 was to remain Bulgarian. Capital: Sofia. Chief cities: Sofia (est. 1942) 401,000, Philippopolis (Plovdiv) 99,883, Varna 69,944, Russé (Ruschuk) 49,447, Burgas 36,230, Plevna (Pleven) 31,520. Religion: mainly Greek Orthodox; about 1,000,000 Moslems; before 1941 there were about 50,000 Jews. Prime minister (1946): George Dimitrov.

History.—The Fatherland Front coalition government which had come to power in Sept. 1944 under the leadership of the communists and with the full backing of the U.S.S.R., continued in power throughout the greater part of 1946. After Sept. 1944 the real power was in the hands of the Bulgarian National committee and the local National committees, the president of which was the veteran Communist leader and former secretary-general of the Communist International, George Dimitrov, and the secretary-general of which was a woman Communist, Zola Dragoicheva, who directed the events in the country in such a way that by the end of 1946 the Communist party could officially take over the government of the country and reduce the democratic opposition to complete impotence. This ruthless process was accomplished in spite of all the promises given at the Big Three conferences that democratic liberties should be safeguarded in Bulgaria and free elections held.

The Moscow conference of the Big Three at the end of 1945 had decided that the U.S.S.R. should advise Bulgaria to include in its government representatives of at least two democratic groups. The most important democratic forces in Bulgaria were the Agrarians under Nikolai Petkov and the Socialists under Kristo Pastukhov; the most popular democratic leaders were the veteran liberal Nikolai Mushanov and the Agrarian Georg Dimitrov (not to be confused with the communist leader of the same name). The opposition demanded guarantees for the liberties of Bulgarian citizens, freedom of the army from all party influences, and the holding of new elections. The leaders of the government, among whom the minister of the interior, Anton Yugov, who was a leading communist and in control of the police, was the most influential, went on Jan. 7 to Moscow to consult with the U.S.S.R. about the demands of the opposition. Soviet vice-commissar Andrei Vishinsky visited Sofia but the opposition leaders insisted on their demands for liberty in spite of Vishinsky's threats that "history will pass by such people and will follow its course."

On Feb. 22 the U.S. government urged upon Bulgaria a mutually acceptable basis for the inclusion in the cabinet of two truly representative members of the opposition. This demand was sharply rebuked by the soviet government. On March 10 the U.S. secretary of state expressed his surprise that the U.S.S.R. had taken exception to his expectation that the opposition leaders should enter the government on terms satisfactory to the opposition as well as to the government. He regarded this expectation as "the very essence" of the Moscow pact, and a "fundamental and simple proposition."

But the efforts of the U.S. were of no avail. On March 31 Bulgaria formed a slightly changed cabinet, without including any members of the democratic opposition, because "the soviet union considered the terms presented by the opposition for participation in the government . . . unacceptable." The new government followed an even more outspokenly extremist

SIMEON II, former king of Bulgaria, with Queen Mother Giovanna in Istanbul, Turkey, on the way to exile in Egypt, Sept. 17, 1946

course. On April 19 it introduced a bill providing for the suppression of newspapers deemed guilty of the systematic publication of material prejudicial "to the interests of the state or its relations with foreign powers."

When the opposition leaders submitted their grievances to the Allied Control commission in Sofia, the government violently attacked this "seeking foreign intervention in the internal affairs of the country," organized spontaneous mass meetings throughout the land and filled them as well as its press with gravest warnings to the opposition. Late in the spring public trials against the most popular democratic leaders, the Agrarian Dimitrov and the Socialist Pastukhov, were instituted. A general purge of Bulgarian army officers was carried through. General Damian Veltchev resigned as minister of war.

On Sept. 8 a plebiscite was held in which the Bulgarian people decided to abolish the monarchy and to introduce a "people's republic." The young king Simeon II and his mother went into exile. The prerogatives of the crown were assumed provisionally by the praesidium of the national assembly whose chairman was the Communist, Vasil Kolarov. New elections were fixed for Oct. 27. The measures proposed by the U.S. to assure free elections on that date were blocked by the U.S.S.R. The opposition parties charged that free elections were impossible under present restrictions. On Oct. 26 the Communist leader George Dimitrov warned that any opposition to the government coalition would be traitorous. "It is worth remembering the fate of Draja Mikhailovich," he said.

At the elections the government parties of the Fatherland Front received 2,983,803 votes and 364 seats, the opposition

1,231,637 votes and 101 seats. The Communists emerged as the strongest single party with 2,265,105 votes and 277 seats, thus gaining the majority in the assembly. The Zveno party to which the prime minister belonged and which had helped to put the Communists into power, was decisively defeated. As a result, prime minister Kimon Georgiev who had been head of the Fatherland Front government from Sept. 1944 resigned, and George Dimitrov, the veteran leader of the Communist party, was entrusted with the task of forming a new Bulgarian government and became prime minister.

Bureau of Standards, National: see STANDARDS, NATIONAL BUREAU OF.

Burma. A British dependency lying on the eastern side of the Bay of Bengal, between India, China and Siam; occupied by Japan in 1942 and liberated in 1945. Area: 261,749 sq.mi.; pop. (1941): 16,823,798. Chief cities (1941): Rangoon (cap., 500,800); Mandalay (163,527); Moulmein (70,000). Languages: Burmese and English; religion: Buddhist (85%). Governor: Maj. Gen. Sir Hubert Rance (appointed Aug. 1946); counsellors: the Hon. Sir R. M. MacDougall; the Hon. U. Aung San (appointed Sept. 1946).

History.—In accordance with the policy announced in a White Paper of 1945 an advisory executive council of 11 members and an advisory legislative council of 34 members were formed to aid the governor in Nov. and Dec. 1945.

Great political activity followed the return of the civil administration. U. Aung San, major general and minister of war under the Japanese-sponsored government, led the patriotic Burmese forces in 1945 against the Japanese and became head of the Anti-Fascist People's Freedom league which claimed to represent all political parties. The A.F.P.F.L. refused to enter the executive and legislative councils on the governor's conditions and conducted an active political campaign. This, after a series of strikes involving the subordinate police and other government services, ended in Sept. 1946 with the formation of a new executive council in which the A.F.P.F.L. had six members, U. Aung San becoming also counsellor for defense and external affairs. Other parties represented were the Myochit (leader U. Saw) and the Karens. Dr. Ba Maw's party (Sinyetha) refused to enter the council. The new council was given much wider powers. The political situation, however, appeared unstable. The legislative council was dissolved in Nov. 1946. At the end of the year the British government was inviting Burmese leaders to come to London for discussions.

A general election was to be held in April 1947 and a constituent assembly would probably be formed soon after to determine a future constitution for Burma.

During the Japanese occupation rice-growing areas had been halved, timber extraction vastly reduced and oil-winning and mining almost stopped, while Burma was starved of consumer goods. The whole economy had therefore been disrupted. Although much was achieved, rehabilitation was slow, hampered by lack of heavy material, consumer goods and transport, and in parts by extreme lawlessness. Towards rehabilitation Great Britain was to give Burma an interest-free loan of £87,500,000.

(J. CE.)

Education.—In 1940, total number of institutions 27,015, scholars 851,922; primary schools 5,679, scholars 384,060; middle 1,018, scholars 139,190; high 399, scholars 94,353; special 1,172, scholars 19,190; unrecognized institutions 18,745, scholars 212,663; university (Rangoon) 2,365 students; art college (Mandalay) 101.

Finance.—Revenue (est. 1941-42) £12,847,500; expenditure

(est. 1941-42) £13,710,000; public debt: £38,510,560; exchange rate: rupee (Rs.1)=1s. 6d. (30.155 cents U.S.); one crore=10,000,000 rupees; one lakh=100,000 rupees.

Trade and Communication.—Overseas trade in merchandise (April 1940—March 1941): imports £22,162,500; exports, including re-exports, £41,535,000. Communication (1940): roads for motor traffic, all weather, 6,811 mi.; seasonal 5,661 mi.; railways 2,060 mi.; inland waterways (approx.) 1,300 mi.

Agriculture and Mineral Production.—Production (1940-41) (in short tons): rice 6,720,000; ground nuts 179,200; sesamum seed 80,640; cotton 14,560; tobacco 53,435; teak 491,486. Minerals (1939) petroleum 331,069,920 U.S. gal.; (in short tons) tin concentrates 6,093; tungsten concentrates 4,863; tin tungsten concentrates 6,264; refined lead 85,120; antimonial lead 1,322; zinc concentrates 66,640; copper matte 8,887; nickel speiss 3,244; silver 6,175,000 troy oz.; gold 1,206 troy oz.

Buses: see AUTOMOBILE INDUSTRY; ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION.

Business Review. Business during 1946 was characterized in the United States by postwar readjustments and labour unrest. By the end of 1945 a great part of the physical reconversion from production of wartime goods to the production of peacetime goods had been effected. However, the economic system did not automatically return to the prewar balance. Adjustments were taking place but had by no means been completed by the end of the year. Organized labour struggled to maintain for its members a high weekly take-home pay comparable to that received during World War II.

Manufacturers had difficulty in the procurement of raw materials and finished parts. Many such items were in adequate supply, but frequently one or two critical parts hampered seriously the production of a major product. In many cases during the early part of the year price ceilings and other government controls kept price from being the natural equalizer. In spite of these difficulties, however, industrial production rose to a new high for peacetime, and the Federal Reserve board Index thereof, adjusted for seasonal variation, stood at 182 in November, about 50% above the average for the several years preceding the entry of the United States into the war late in 1941. National income also increased substantially during the year from an annual rate of \$153,000,000,000 in the first quarter to \$168,000,000,000 in the third quarter as compared with annual rates of \$83,000,000,000 in 1929, \$71,000,000,000 in 1939 and \$161,000,000,000 in 1944. The business prophets who forecast a postwar depression for 1946 were proved wrong. Those who predicted prosperity greater than ever before were also proved wrong. The rising price level had made those dollars of national income represent fewer real goods and services than would have been the case had prices held constant. The many postwar readjustments, seen so lightly by some, so ominously by others, were met with much the same skill as were the wartime difficulties.

Labour Unrest.—With the end of the war in Sept. 1945, there was much shifting of labour into different plants, different industries and different jobs within a plant, and a reduction in take-home pay because of the reduction of overtime. This did not immediately lead to widespread difficulties because labour feared possible large-scale unemployment. But when it developed that the large backlog of civilian demand for war-short products would prove more important than the losses of reconversion, labour sought increased wages. The demands were based in part on the failure of the government to stabilize prices of the commodities which workers buy and in part on the presumption

INDUSTRIAL PRODUCTION of U.S. durable and nondurable goods, 1937-46, adjusted for seasonable variation (1935-39=100) (Source: Board of Governors of the Federal Reserve System)

of industry's ability to pay, as indicated by large corporate profits. When the year 1946 began the members of the United Automobile Workers were striking against General Motors corporation. This strike had been in progress from Nov. 21, 1945. In January a strike of the electrical workers began at General Electric, General Motors and Westinghouse. Later in the month an industry-wide steel strike was called. The steel strike was settled in the middle of February, but the other two were not settled until March. A strike was called in February against the manufacturers of agricultural equipment including International Harvester, J. I. Case and Allis Chalmers. Workers at the Allis Chalmers plant near Milwaukee were still on strike at the end of the year 1946. With the expiration of the bituminous coal contracts on March 31, the miners stopped work. A two-week truce was called on May 13, and after the expiration of that period coal production again halted for a few days until the government assumed control of the coal mines and made contracts with the United Mine Workers. On May 23 railway engineers and trainmen called a nation-wide strike which, in conjunction with the coal strike, placed the nation in critical condition. This strike was broken by governmental action after 48 hours. This series of strikes in the first half of 1946 gave rise to increasing demands from the public for restrictions on the power of labour. Drastic anti-labour legislation was proposed in congress but failed to become law.

A strike of some unions of maritime workers was called Sept. 5. As additional unions respected picket lines or struck directly, the shipping on east, west and Gulf coasts came to a standstill. When the Wage Stabilization board amended its regulations to permit the higher wage agreed upon by operators and unions, Pacific coast employees went back to work but Atlantic and Gulf coast workers stayed out until Sept. 20. As shipping was approaching normal on Sept. 30, the contracts expired between operators and masters, mates, pilots and engineers. This virtually stopped all shipping until Oct. 26 when work resumed on the Gulf and east coasts. Pacific coast shipping did not start until a few days later.

A strike of truck operators in New York city from Sept. 1 to 17 severely affected life in that city by stopping all truck movements, even those of food, medicines and other essentials. About 700 retail stores were forced to close before work was resumed. When electric power workers in Pittsburgh struck for several weeks in September and October life in that city was also severely altered.

On Nov. 20 John L. Lewis declared void the contracts be-

tween the United Mine Workers and the government, which was still operating the coal mines, and in accord with the bituminous miners' tradition of "no contract, no work," the bituminous mines closed down. The previous coal strike in the spring had come at a time when demand for coal was declining seasonally and when stocks were high. The full weight of the earlier strike was not felt by the general public for several weeks, not until coal-burning train schedules and coal-generated electric energy production was substantially restricted. In this autumn strike, however, restrictions were placed immediately upon coal consumption. The federal government declared that the union had no right to cancel the contracts and the union was enjoined from so doing. The contracts stayed cancelled and production remained at a standstill. Lewis and the United Mine Workers were brought to trial for contempt of court. It was rumoured that the union offered to compromise before a decision was reached, but if any such offer was made, it was rejected. Lewis and the U.M.W. were held in contempt and fined \$10,000 and \$3,500,000 respectively. The case was appealed to the United States supreme court, and, upon the return of the miners to work Dec. 7, action by the supreme court was deferred until Jan. 1947.

This series of strikes seriously affected the economy. The strikes against the individual companies hurt them considerably and, in that these strikes retarded the availability of much-wanted goods, they retarded production of companies dependent upon the striking companies, and the strikes thereby gave added impetus to the price inflation which was under way. To the extent that the workers received added income, price inflation received an added boost. The industry-wide strikes did more than that. They threatened the whole economic system because of the nation's dependence on coal for heat, steel, electric power and transportation. These facts led to an acute awareness and fear of the power of an irresponsible labour union and long-term labour control legislation was being considered for enactment in the new congress, Republican for the first time after 1933, which was to convene in Jan. 1947. Suggestions for

"STILL RACING HIS SHADOW." Shoemaker of the *Chicago Daily News* illustrated labour's problem in 1946

such labour legislation were along the lines of: (1) repeal of the Wagner act, (2) prohibition of industry-wide strikes especially in the case of public service industries, (3) the enumeration of a list of unfair labour practices similar to the list of unfair employer practices, (4) the enunciation of a national labour policy and (5) a method of dealing with the "portal-to-portal" wage suits which had begun to assume importance as the year ended.

Price Control.—During the year 1946 most of the price controls administered through the Office of Price Administration were removed. In the first half of the year the over-all policy was to decontrol prices when the supply was such that an immediate price rise would not follow. Controls were removed in a few other cases if the item was unimportant in the cost of living or if the item was a critical part of some larger item the production of which was held up because of a short supply of this one part. As June 30 approached, the date of the expiration of the price control legislation, there was considerable uncertainty as to congressional and presidential action. Just a few days before expiration of the existing law, a new law was passed. This was vetoed by President Truman as being undesirable, and he requested that the old law be temporarily extended. Such extension was not granted and all price controls expired. Many prices rose; a few dropped. By the middle of July a substitute bill was passed, recontrolling many prices and setting up a decontrol timetable. Some products were exempted until late in August at which time controls could be restored if the Price Decontrol board, established by the new law, felt it advisable. Meat was one of the few products in this latter category which was recontrolled. During the period immediately prior to June 30, meat was very scarce in the markets. Suddenly it was plentiful as the farmers, packers and grocers rushed it to market to get the benefit of the high prices that meat-starved, money-in-the-pocket customers were willing to pay. With recontrol in August meat supplies again dried up. The situation became so bad and the pressures so great that in October President Truman removed all controls from meat and many other products and set a new and speedier timetable for decontrol of remaining items. On Nov. 9 a sweeping presidential order removed almost all of these remaining items from control, only sugar, rice and residential rents staying under. The off-again, on-again price control policies of the government caused unusual swings in the volume of business, not only in the directly affected segments of the economy but also in many other sections, which felt not just the indirect effects of the prices in question but also the possibility of further governmental action directly affecting them. With the announcement of the decontrol of many prices in October and most of the remaining ones in November, businessmen felt considerably more free of governmental control and more balanced relationships began to emerge among prices and among the goods available. (See also PRICE ADMINISTRATION, OFFICE OF; PRICES.)

Industrial Production.—During the year industrial production was maintained at a higher level than ever before for a peacetime year. The seasonally adjusted total index as prepared by the Federal Reserve board stood at 160 in January, dropped to 152 in February as a result of the many important strikes and advanced, with important interruptions, to 182 by November. Both production of durable and nondurable goods contributed to this high total. The durable goods manufacturing index stood at 186 in January, dropped to 138 in February and by November had reached 214. Nondurable goods production did not show the marked advance but remained between 157 and 171 throughout the first 11 months of the year. Not all industries contributed to these high levels of industrial production. Iron and steel, nonferrous metals and products, stone, clay and glass products contributed approximately their share

to the level of durable goods production. Lumber production, though it climbed from 95 in January to 134 in November, was very low compared with other items. Automobile production was low but became fairly high during the year. Transportation equipment as a whole (including auto) was quite high throughout the year. (See also IRON AND STEEL.)

During the last half of 1945 manufacturers' inventories in the durable goods industries had been falling. About the first of the year 1946 they began to rise and rose almost 20% between January and September. In nondurable goods industries the situation was quite different. Inventories had been rising rapidly from the middle of 1945 and about the first of 1946 they levelled off. Then in June they again started a rapid rise. In the durable goods industries inventories in September were 206% as great as in 1939 and in nondurable goods the comparable percentage was 176. Part of the cause of the apparently high level of inventories was the new price level, which was considerably higher than that prevailing before World War II. Part also was associated with the large volume of business being done. Even after taking into account these two factors, however, inventories were still unusually high. Inventories were not balanced among industries, among companies or even among individual articles in the storerooms of individual manufacturers.

The construction and the automobile industries made disappointing records during the year. The acute shortages in housing and automobiles made the postwar outlook of these two industries very promising at the end of the war. The automobile manufacturers completed the physical process of reconversion rapidly, but the labour situation, both with respect to strikes and low individual productivity, and the materials situation hampered production severely. By the end of 1946, automobile dealers still had long waiting lists of potential customers for new cars. The problems of the construction industry were similar. Although there were no nationwide strikes of importance in the building trades the productivity of individual labourers was low. Certain materials, including lumber, were extremely difficult to obtain. Houses that ordinarily would require but three or four months to build, frequently were under construction for more than a year. On top of the difficulties and delays, the cost of new housing was at a new level, 70% above that existing in 1939. (See also BUILDING AND CONSTRUCTION INDUSTRY; HOUSING.)

Government Finance.—Government finance during the year was characterized by tax and debt and expenditure reductions. The only major tax reduction came through the elimination of the excess profits tax on corporations. It not only relieved them of a substantial financial burden but also made for more normal operation of business as opposed to that existing during the war when businessmen were accustomed to figuring that 80% of every added expense was paid for by the government through tax reductions. In Nov. and Dec. 1945 the last of the wartime bond drives was aimed at a goal which was based on predicted 1946 expenditures considerably higher than actually proved to be the case. In addition the loan was heavily oversubscribed. This combined to give the treasury large cash balances. Each time during the year when certificates of indebtedness matured, they were refunded only in part and the balance of the maturing issue was paid off with this surplus cash. During the course of the year this reduced the government debt about \$23,000,000,000 to approximately \$260,000,000,000. (See also BANKING; DEBT, NATIONAL; LAW; TAXATION.)

Securities.—During the early part of the year common stocks sold at prices not seen after the highs of 1937. Prices rose, with an important interruption in February, to a high on May 29. The Dow-Jones Industrial average stood at 212.50 on that day.

During the summer prices dropped slowly. Then in September prices broke sharply and in October the Dow-Jones Industrial average was in the 170s. It moved into the 160s during the following months and recovered to the October level by the end of the year. Bond prices followed a similar pattern though the magnitude of the swings was not so great. The action of the market directly influenced the amount of new financing that took place during the year. The amount of nongovernment securities issued was more than \$500,000,000 monthly during the first eight months of the year. Though a sizeable proportion of new, nongovernment securities issued was for the purpose of financing new buildings and equipment, considerably more than half of the money raised was used to refund outstanding security issues into securities bearing interest rates and other terms more favourable to the company. With the decline in the levels of security prices in September, many corporations found it necessary to postpone or abandon refinancing plans. During the remainder of the year new financing remained at a much lower level.

Consumer Credit.—During the war the board of governors of the federal reserve system announced Regulation W which placed severe limitations on the use of consumer instalment credit in an effort to cut down consumer demand for scarce durable goods and thereby to ease the pressure toward higher prices. Even though considerable pressures toward higher prices still existed and many durable goods continued to be scarce, the situation had cleared itself substantially and on Dec. 1 most of the restrictions under Regulation W were lifted. The maximum time limitation on charge accounts and single payment loans was removed. Instalment sales of and loans on all but 12 types of durable goods (still in short supply) were also freed from controls. Even on the items still under control, the maximum time allowed on payments was extended from 12 to 15 months, thereby making possible smaller monthly payments. During the war the total amount of consumer credit outstanding had fallen from an all-time peak of \$10,000,000,000 near the end of 1941 to a low of \$5,000,000,000 in early 1944. (The depression low in 1933 was a little less than \$4,000,000,000.) The rise from the low of 1944 to the end of the war was slow and erratic. With the end of the war the rise became rapid and during 1946 gathered momentum until it stood slightly above \$8,000,000,000 in September.

Money.—The total supply of money (both deposits and currency) in the United States was \$175,000,000,000 in Dec. 1945. It increased to a little more than \$177,000,000,000 in February and then dropped continuously until it stood at \$169,500,000,000 in September. This had been brought about almost entirely by a reduction in the government deposits in banks and was closely associated with the debt retirement program. This reduction in deposits also affected the investments of banks. Government security holdings decreased considerably with most of the decrease taking place in shorter maturities. Total bank loans stayed at approximately the same level throughout the year, but commercial loans and real estate loans increased while other types declined. During the year the banks continued the policy of keeping excess reserves at a very low level. This procedure was made possible by the announced policy of the federal reserve banks to stand ready to buy or discount certain short term government securities.

Company Earnings.—The financial experience of private business corporations during 1946 varied greatly from industry to industry and even from company to company within an industry. Those companies which were fortunate enough to be free from labour and material difficulties were able to make very profitable showings. Those hampered by shortages and strikes in many cases had very poor results. The National City

Bank of New York reported that net income of 350 leading corporations in various industries increased for the first 9 months of 1946 as compared with 1945. The rate of return on net worth increased in all industries except electrical equipment and automobiles and equipment. In those two the rate was substantially decreased. Certain large corporations including General Motors and General Electric showed a profit only because of large tax credits available because of a serious drop in earnings. (See also STOCKS AND BONDS.)

Railroad Transportation.—Freight-car loadings for the first nine months of 1946, after adjustment for seasonal variation, averaged 8% lower than the peak war year, 1944. The car-loadings for 1946 might have been considerably higher had it not been for the two very low months of April and May when rail shipments were severely curtailed as a result of the coal strike. In July the railroads were allowed a small temporary rate increase. Early in December a permanent rate increase effective Jan. 1, 1947, was announced which averaged a little more than 17%. (See also RAILROADS.)

Foreign Trade.—The foreign trade of the United States rose month by month for the first seven months of 1946. The figures for September and October were affected severely by the maritime strikes that closed the ports for part of these two months. About one-sixth of the total was "noncommercial," i.e., shipments for which payment was not required, such as gifts and shipments by the United Nations Relief and Rehabilitation administration. This percentage was an average for United States shipments to all parts of the world; for many sections it was far higher. Approximately one-third of the shipments to Europe for the second quarter of the year were noncommercial in nature. Within this one group of nations the percentage of noncommercial shipments varied greatly. The wartime neutral nations and the liberated nations were treated almost entirely upon a commercial basis. Italy was a large recipient of the non-commercial shipments but also took part in commercial trade to some extent. To the eastern European countries there were almost no exports other than those of noncommercial nature. Trade with many of the Latin American countries was substantially above the level existing before the war.

Canada.—In Canada the physical volume of business continued at a high level throughout the year 1946. The over-all index of business averaged about 185 for the first eight months of the year as compared with 100 for the years 1935-39. An appraisal of business activity in Canada must be tempered by the fact that the index, after adjustment for seasonal variation, declined from 195 in January to 178 in August. Both the industrial production and distribution components of the index contributed to the decline. Distribution was off 7% whereas industrial production was off slightly more. Not all components of the industrial production index were off. Mining and electric power were up; manufacturing was down 10%. The most significant drop was in the construction industry which was down nearly 30%. During the first eight months of the year the Canadian price level had risen about 5%. (See also CANADA, DOMINION OF; COPPER; STRATEGIC MINERAL SUPPLIES.)

Great Britain.—In Great Britain the program of nationalization of industry continued during 1946. Plans for nationalization of the coal mines and the Bank of England already had been completed. Plans were proceeding for applying the same action to the transportation industry and the electric energy producing companies. One of the greatest problems during the year was that of manpower. The number of available workers was about 10% below that necessary to achieve the announced long-range programs. However, progress was being made in redistribution of labour from war industries to peacetime employment, and, in the coal mines at least, there was an in-

crease in the efficiency of the workers. The volume of exports was rising gradually and that of imports falling, indicating progress toward the goal of again becoming self-sufficient and building up the depleted supplies of foreign exchange. (See also AVIATION, CIVIL; AVIATION, MILITARY; GREAT BRITAIN; INCOME AND PRODUCT, U.S.; INTERNATIONAL TRADE; RUBBER; SHIPBUILDING; WAGES AND HOURS.) (F. E. C.; J. H. Ms.)

Butter. The decline in butter production in the United States was checked in late 1946 but not in time to prevent the total output dropping below that of 1945. Total butter production was estimated at 1,500,000,000 lb., the lowest in 40 years, compared with 1,706,000,000 lb. in 1945 and the prewar average of 2,170,000,000 lb. in 1935-39. Creamery butter production alone amounted to about 1,100,000,000 lb. compared with 1,362,000,000 lb. in 1945. After July the decline in butter production slowed down and in September the output was larger than that of a year earlier for the first time. Advancing prices and lower consumption of milk and cream increased the butter output.

Milk production reached a new high level in 1945 and 1946 but the decline in the number of cows in 1946 slightly reduced the total output of milk although production per cow made a new high record.

The price of butterfat to farmers was steady at around 50 cents per pound until the lapse of the Office of Price Administration in July when it jumped to 70 cents, then to 75.6 cents in September and to 90 cents in October. After that the price declined to 87 cents in December. This great increase in the price of butterfat was reflected instantly in the farm price of butter which rose from the level of around 47 cents per pound in 1945 to 63 cents in July and to 73.3 cents in December. Retail prices to consumers increased even more when controls were removed and in locations of scarcity fantastic prices were reported for a short period. After a few weeks, however, consumer demand slackened and butter prices became stabilized at around 85 cents per pound in retail markets during the fall months.

Civilian consumption of butter declined from the prewar average of 16.7 lb. per capita, 1935-39, to 11.7 lb. in 1943, 11.9 lb. in 1944, 10.9 lb. in 1945 and 10.5 lb. in 1946. Lower butter production continued through 1945 and only slight relief was afforded when government stocks were turned back to civilian use after the end of hostilities. With the end of rationing and continued reduction of production civilian consumption was expected to continue low through 1947. (See also CHEESE; DAIRYING; MARGARINE; MILK.) (J. C. Ms.)

Byrnes, James F. (1879-), U.S. jurist and government official, was born May 2 in Charleston, S.C., of Irish parentage. At the age of 14 he left school to become office boy of a law firm. In 1910, he was elected to the house of representatives on the Democratic ticket and was re-elected six times, serving from 1911 to 1925. In 1930 he was elected to the U.S. senate and was re-elected in 1936.

He was appointed associate justice of the supreme court in June 1941, but resigned 16 months later to become head of the newly-created Office of Economic Stabilization. On May 28, 1943, he was made director of another new agency, the Office of War Mobilization, but resigned (April 2) as the war drew toward its close. He returned to the government on June 30 as secretary of state for President Truman and accompanied the president to the Potsdam conference (July-Aug. 1945). He later attended the first meeting of the council of foreign ministers in London (Sept.-Oct. 1945) which ended in a stalemate,

THE POLITICAL INCLINATIONS of the members of the U.S. state department in 1946 were of slight concern to Secretary of State James F. Byrnes, according to C. K. Berryman of the *Washington Evening Star*

and the more successful conference of the British, U.S. and soviet foreign ministers held in Moscow in Dec. 1945. Byrnes then pursued throughout 1946 what was generally called a "firm policy" at various meetings of the council of foreign ministers, at the Paris peace conference and at the U.N. Security council sessions in London and New York. While President Truman had previously endorsed Byrnes' foreign policy, his approval of a speech by Henry Wallace in New York in Sept. 1946, appeared to be a reversal of his position. Truman repaired the damage by ousting Wallace and reiterating that he stood by Byrnes. Byrnes resigned for reasons of health, Jan. 7, 1947, and was succeeded by Gen. George C. Marshall as secretary of state. In a "farewell" address made in Cleveland, Jan. 11, Byrnes said he was more confident than ever that the U.S. could "achieve a just peace" by persisting with firmness.

Cabinet Members. The following members of President Truman's cabinet held office on Jan. 1, 1947.

Post	Name	State
Secretary of State	James F. Byrnes	South Carolina
Secretary of the Treasury	John W. Snyder	Missouri
Secretary of War	Robert P. Patterson	New York
Attorney General	Thomas C. Clark	Texas
Postmaster General	Robert E. Hannegan	Missouri
Secretary of the Navy	James V. Forrestal	New York
Secretary of the Interior	Julius A. Krug	Tennessee
Secretary of Agriculture	Clinton P. Anderson	New Mexico
Secretary of Commerce	W. Averell Harriman	New York
Secretary of Labor	Lewis B. Schwellenbach	Washington

Great Britain.—On Dec. 31, 1946, the British Labour cabinet was composed as follows:

Post	Name
Prime Minister	Clement Attlee
Lord President of the Council	Herbert Morrison
Secretary of State for Foreign Affairs	Ernest Bevin
Lord Privy Seal	Arthur Greenwood
Chancellor of the Exchequer	Hugh Dalton
President of the Board of Trade	Sir Stafford Cripps, K.C.
Minister without portfolio	Arthur V. Alexander
Lord Chancellor	Baron Jowitt
Secretary of State for the Home Department	James Chuter Ede
Secretary of State for Dominion Affairs	Viscount Addison
Secretary of State for India and for Burma	Baron Pethick-Lawrence
Secretary of State for Scotland	Joseph Westwood
Secretary of State for the Colonies	Arthur Creech Jones
Minister of Labour and National Service	George A. Isaacs
Minister of Fuel and Power	Emanuel Shinwell
Minister of Education	Ellen Wilkinson
Minister of Health	Aneurin Bevan
Minister of Agriculture and Fisheries	Thomas Williams

The following were ministers not in the cabinet:

<i>Post</i>	<i>Name</i>
First Lord of the Admiralty	Viscount Hall
Secretary of State for War	Frederick J. Bellenger
Secretary of State for Air	Philip Noel-Baker
Minister of Supply	John Wilmot
Minister of Transport	Alfred Barnes
Minister of Food	John Strachey
Minister of Works	George Tomlinson
Minister of Town and Country Planning	Lewis Silkin
Minister of National Insurance	James Griffiths
Minister of Civil Aviation	Baron Nathan
Postmaster General	Earl of Listowel
Minister of State	Hector McNeil
Minister of Pensions	Wilfred Paling
Chancellor of the Duchy of Lancaster	John B. Hynd

(See also GOVERNMENT DEPARTMENTS AND BUREAUS.)

Cacao: see COCOA.

Caccia Dominioni, Camillo, CARDINAL (1877-1946), Italian prelate, was born at Milan and educated at the seminary in that city. Ordained a priest in 1899, he became papal master of the chamber and in 1935 was elevated to the Sacred College by Pope Pius XI. A member of the ecclesiastical authority of Rome, Mgr. Dominioni in 1929 assumed charge of the papal household when a pope left the Vatican walls for the first time after 1870. On Feb. 12, 1931, he officiated on the radio broadcast which celebrated the status of Pope Pius XI as the ruler of the independent state, Vatican City. He died at Vatican City on Nov. 12.

Cadmium. Production of cadmium in the United States increased from 3,182 short tons in 1940 to 4,390 tons in 1944 and 4,192 tons in 1945, including 3,966 tons of metal and 226 tons in compounds. Secondary recovery dropped from 190 tons in 1941 to 53 tons in 1944 and 36 tons in 1945. Shipments exceeded output by a few tons. Consumption was 4,433 tons in 1944 and 1,877 tons in the first half of 1945. Metal imports amount to only a few tons a year, but cadmium content of flue dust imported from Mexico rose from 845 tons in 1944 to 1,096 tons in 1945. However, the latter item was offset by exports of approximately equivalent amounts in dross, flue dust, residues and scrap, and exports in metal, alloys and compounds exceeded imports. In spite of heavy demands, stocks had been built up to 1,703 tons at the end of 1943, declining to 1,513 tons in 1944, and 840 tons in 1945.

Outputs of other leading producers in 1944, so far as available, were as follows, in short tons, with 1945 figures in parentheses: Australia 280 (284), Canada 263 (319), Mexico 774 (1,161). (G. A. Ro.)

Cadogan, Sir Alexander George Montagu

(1884-), British diplomatist and statesman, was born on Nov. 25, youngest son of the fifth earl of Cadogan. Educated at Eton and Oxford university, he entered Britain's diplomatic service and was made a foreign office counsellor in 1928. Sir Alexander was knighted in 1934. He was envoy extraordinary and minister plenipotentiary to China (1933-35) and in 1935, when the Chinese legation was raised to the status of an embassy, he became the British ambassador to China.

Cadogan returned to London in 1936 to become deputy undersecretary of state for foreign affairs and two years later, he succeeded Sir Robert Vansittart as permanent undersecretary.

In 1944 Sir Alexander headed the British delegation to the Dumbarton Oaks conference and he attended the United Nations conferences in San Francisco, Calif., in 1945. The British government, Jan. 31, 1946, announced that Cadogan had been chosen permanent British representative on the U.N. security

council.

In the New York sessions of the security council, Sir Alexander declared Aug. 24, 1946, that abuse of the veto tended to discredit the U.N. He also denounced the Ukraine's complaint to the security council against Greece and the United Kingdom as "unbridled propaganda."

Calendar of Events, 1946: see pages 1-16.

California. The most southerly Pacific coast state of the United States, acquired statehood Sept. 9, 1850. It is popularly known as the "Golden state." The area is 158,693 sq.mi., of which 1,890 sq.mi. is water. Pop. 8,822,688 (U.S. bureau of census est. for 1945) or 27.7% more than the 1940 census. Chief cities (with increase over 1940 in parentheses) were: Los Angeles, 1,805,687 (20.0%); San Francisco 827,400 (30.3%); Oakland, 400,935 (32.7%); San Diego, 361,942 (78.0%); Long Beach, 241,609 (46.8%); Berkeley, 100,024 (16.9%); Pasadena, 99,003 (20.9%); Glendale, 96,495 (16.8%); Richmond, 93,738 (252.1%). The capital, Sacramento, had a pop. of 105,958 (1940 census).

History.—The year 1946 saw the re-election of Republican Earl Warren as governor in a victory that indicated the state's return to its traditional Republican affiliation. At the start of the campaign, both Gov. Warren and his Democratic opponent, state Atty. Gen. Robert W. Kenny, declared themselves bipartisan liberals, and each took advantage of California's cross-filing law to cross-file in the opposite party. Gov. Warren had the support of the American Federation of Labor, while Robert W. Kenny had the backing of the Congress of Industrial Organizations' Political Action committee. In the June primaries the governor won about 90% of the Republican vote and approximately 55% of the Democratic vote, being the first executive in the history of the state to win both the Republican and Democratic nominations. Will Rogers, Jr., was chosen over Rep. Ellis Patterson to be the Democratic nominee for the U.S. senate. As a result of the governor's victory in the primary, interest in the pre-election race centred on the contest between Will Rogers, Jr., and the incumbent Sen. William F. Knowland. The November elections found the Republican candidates victorious, Sen. Knowland defeating Will Rogers, Jr., by around 900,000 votes.

A number of state propositions came up for consideration at the election. Californians voted to float a bond issue for \$100,000,000 to help veterans get homes and farms but turned down a proposal to make business loans to veterans. A state-wide minimum of \$2,400 per year for teachers' salaries was approved. A law to legalize dog racing and betting thereon was voted down as was a Fair Employment Practices commission which would have tried employers suspected of discriminating against employees because of race, religion, colour, or ancestry.

During the year California struggled with the problems that reconversion and a large increase in population had brought. Disputes between labour and management and jurisdictional disagreements between various labour factions slowed the return to peacetime activities. A mass strike of 100,000 A.F.L. labourers tied up business in Oakland for three days, while a jurisdictional labour dispute at seven of the major Hollywood movie studios brought violence between pickets and nonstrikers. As part of a nation-wide movement, west coast shipping was tied up twice during the year while operators and union officials sought to break wage-increase stalemates. Sharing prominence with labour troubles was the postwar housing situation. In July Gov. Warren called a special session of the legislature to enact rent control legislation, and hearings were under way when word came that congress was taking the necessary action.

Officials estimated that there was need for 625,000 new homes in the state.

Education.—State apportionments for elementary, high school and junior college school districts amounted to \$95,956,331.29 for 1945-46. Average daily attendance for 1945-46 was estimated to have been 884,102 for kindergartens and elementary schools; 328,847 for high schools; and 31,585 for junior colleges. The combined enrolment for the eight schools of the University of California was 40,800 for the fall semester of 1946-47, of which 22,355 were veterans and 21,909 were enrolled at the Berkeley campus.

Social Insurance and Assistance, Public Welfare and Related Programs.—In Sept. 1945 the average monthly assistance grant for the 158,121 recipients of social security in the state amounted to \$47.34. At the same time, 5,336 needy or partially self-supporting blind persons were receiving aid, the maximum grant for both programs having been increased from \$50 to \$60 by the 1945 legislature. Also as the result of legislative action a department of mental hygiene was set up to operate seven mental hospitals, two institutions for the mentally deficient and an acute neuropsychiatric unit for the treatment and teaching of the 37,076 patients under its jurisdiction. In addition to the three correctional schools already established, five work camps were set up for the training and treatment of the state's juvenile delinquents. The 1945 legislature inaugurated a new program designed to aid in the rehabilitation of the inmates of the four state penal institutions by establishing a vocational institution, a medium-security type institution and a department of corrections medical faculty. In a reorganization effective May 21, 1946, a new department of veterans' affairs took over the supervision of matters pertaining to veterans.

Banking and Finance.—In 1945 there were 279 state banks with deposits of \$2,564,001,000, and with resources amounting to \$3,236,602,000, or \$540,979,000 more than the previous all-time high of 1944.

Budget appropriations for the 1945-47 biennium was set at \$893,933,000 and on July 1, 1946, reserves totalled \$181,876,554.70.

A record high in tax collections for the fiscal year 1945-46 brought in \$612,320,257 (1944-45, \$560,272,395). The retail sales and use tax returned \$178,812,541 (1944-45, \$150,314,238); unemployment insurance tax \$143,925,686 (1944-45, \$164,162,201); gasoline tax \$59,201,583 (1944-45, \$43,947,936); bank and corporation tax \$55,415,943 (1944-45, \$57,647,503); personal income tax \$44,946,361 (1944-45, \$47,133,088); alcohol beverage revenue \$30,121,049 (1944-45, \$25,785,527); horse racing revenue \$22,758,059 (1944-45, \$7,142,622).

The assessed value of property subject to local taxation for the fiscal year 1945-46 was \$9,119,756,060. This was the first time in the history of the state that the valuation had exceeded \$9,000,000,000.

Communication.—In Sept. 1946 motor vehicle registration of all classes reached 3,294,201, exceeding by 130,807 the previous high point recorded for 1941. There were 2,701,489 automobiles; 275,105 trucks; 31,786 motorcycles; and 285,821 trailers. Late in 1946 a committee of state senators and assemblymen presented Gov. Warren a \$2,819,853,000 program of highway, street and bridge construction which would be completed by June 30, 1959. The report indicated that of the 13,886 mi. of state highway system about 5,000 mi. were less than 20 ft. wide. The governor announced his support of the committee's proposed increase in the state gasoline tax as one means of raising additional revenue needed to carry out the program. In 1944 the estimated average number of telephones was 2,223,506, a 3.39% increase over 1943. California, in 1940, had 16,856 mi. of railway, 2,768 mi. of that being electrified.

Agriculture.—Although less than 10% of its population lived on farms in 1944 and 1945, California led the nation in cash farm income with a total of \$1,744,445,000 in 1944 and \$1,825,000,000 (est.) in 1945. Field, fruit and truck crops gave it first rank with 14% of the nation's total. Its orchards and vineyards produced nearly half of the commercial fruit output of the U.S. as measured by cash farm returns, and its truck farms produced about one-fourth of the vegetables. The 1940 census listed 132,658 farms totalling 30,524,000 ac. while a special census in 1945 recorded 141,577 farms with a combined acreage of 35,062,627. The Central Valley Reclamation project, being constructed by the U.S. bureau of reclamation at a cost of \$360,000,000, would bring supplemental water supplies for irrigation to the Sacramento and San Joaquin valleys.

Manufacturing.—The steady decline from the high employment level of 1943 continued in 1946 but estimates indicated a 600,000 to 625,000 total factory employment or 57% to 60% above 1939 totals. The employed civilian labour force in California in Jan. 1946 equalled 3,135,000 (1945, 3,351,000); trade, 658,000 (1945, 610,000); service-finance, 616,000 (1945, 585,000); manufacturing, 589,000 (1945, 859,000); government, 457,000 (1945, 503,000); agriculture, 312,000 (1945, 340,000); utilities, 284,000 (1945, 275,000); construction, 160,000 (1945, 125,000); mining, 39,000 (1945, 34,000).

During 1946 the national trend toward decentralization of industry was evidenced by an unprecedented number of national manufacturing concerns which established branch plants in California or purchased sites for later expansion. The total value of products in 1945 was estimated

to be \$8,601,195,000 (1944, \$10,141,496,000 or 6.49% of U.S.). The four leading major groups of industry in 1945 were: food and beverage products, \$2,056,095,000 (1944, \$2,019,858,000); transportation (aircraft and shipbuilding), \$2,023,917,000 (1944, \$3,188,396,000); petroleum products industries, \$843,714,000 (1944, \$804,351,000); iron, steel and products, \$522,290,000 (1944, \$665,651,000).

Mineral Production.—Mineral production in 1945 was valued at \$488,244,000, or 4% above the 1944 level and higher than any previous year. Generally, fuels, structural materials and industrial materials increased in output while metals (except gold) and salines declined.

Value of Principal Minerals Produced in California, 1945 and 1944

Product	Value (1945)	Value (1944)
Petroleum	\$347,832,000	\$330,659,802
Natural gas	36,484,000	31,797,418
Gold	6,023,000	4,108,055
Quicksilver	2,918,000	3,178,969
Zinc	2,055,000	1,875,996
Copper	1,878,000	3,453,957
Lead	1,113,000	912,670
Cement	25,696,000	21,249,520
Miscellaneous stone	23,500,000	25,138,003
Brick and tile	3,450,000	3,930,662

California, University of. A state-supported, coeducational institution with headquarters at Berkeley where the university was founded March 23, 1868, and with seven other campuses, at Los Angeles, San Francisco, Davis, Santa Barbara, Riverside, Mt. Hamilton and LaJolla. The year 1946 saw the completion of the shift in the university's facilities to meet post-war educational problems of an enrolment of 40,800 students on the 8 campuses. Construction began on the first of more than 60 buildings for which approximately \$60,000,000 had been authorized by the state legislature. Of this amount \$4,400,000 to be matched by an equal sum from other sources, was earmarked for dormitories, construction of which would mark a new university policy toward student housing. To meet housing demands created by an enrolment of more than 20,000 veterans, the university took over wartime housing facilities near 3 of its campuses and procured, as far as possible, surplus units for married veterans. Expanded curricula in both oriental and Slavic languages were provided on the Berkeley campus and were in prospect for the Los Angeles campus. At Berkeley a new teaching institute of economics began its work in the fall semester. The college of agriculture greatly enlarged both its research and field programs and provided additional means of disseminating agricultural information more widely. In the atomic research program, 1946 saw the successful operation of the new 184-in. cyclotron which produced projectiles of 200,000,000 electron volts, about 10 times the power of any previous machine. Construction also began on 2 new atom-smasher types: a 300,000,000 volt synchrotron and a pilot model of what might become a 1,000,000,000 volt linear accelerator. A new nuclear physics research program was started on the Los Angeles campus, and the pioneer 37-in. cyclotron was readied for removal to that campus. Designs for a 120-in. telescope, to be the second largest in the world, were well advanced by astronomers at Lick observatory on the Mt. Hamilton campus. A marine physical laboratory was established at San Diego in collaboration with the U.S. navy. Operation of the university's Los Alamos (N.M.) scientific laboratory, where the atomic bomb was designed and made, and of the U.S. navy electronics laboratory at San Diego was continued. The adult education program of university extension was broadened, particularly in regard to institutes and refresher and short courses, with both class and correspondence enrolments at new highs. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

Cambridge University. The academic year 1945-46 opened with 3,110 men and 610 women undergraduates; graduates, research students and staff numbered 1,526 men and 223 women at Newnham and Girton. Arts men were for the first time allowed to defer their national service; and in the future 90% of all places in colleges were to be filled by former service applicants. Honorary degrees were conferred on the chief leaders in the war in both the services (including General Dwight D. Eisenhower) and the government (including the prime minister, Winston Churchill) and on Allied ambassadors. Dr. H. J. Chaytor, master of St. Catharine's, retired by age and Dr. G. A. Chase (master of Selwyn) became bishop of Ripon. Three professors resigned, Sir A. D. McNair (comparative law) to become a judge of the International Court of Justice, Professor J. D. Cockcroft (natural philosophy) to become director of atomic energy in the ministry of supply and Professor E. K. Rideal (colloid science), who went to the Royal Institution. Dexter Perkins became the first professor of U.S. history.

Scholarships in Chinese and a large collection of rare Chinese literature were given by China. The Rockefeller foundation and commercial firms gave funds for research and the treasury grant increased threefold, mainly for science. A department of experimental medicine was created, and a new wing was added to the Cavendish laboratory for atomic physics.

Camp Fire Girls. In 1946 Camp Fire Girls, Inc. had a membership of more than 360,000 girls in the United States, representing all races and creeds. In addition to the United States, Camp Fire groups had also been established in England, Canada, El Salvador, Alaska, South Africa and the Republic of the Philippines. The youth agency serves three age levels: Blue Birds, the junior division, are from 7 to 9; Camp Fire Girls, the intermediary group, range from 10 to 15, and the Horizon Clubbers, the senior group, are from 15 through senior high school age.

Each year Camp Fire chooses a national project to highlight a vital phase of its over-all program. "At Home in the World" was the special theme for 1946. Through participation in the project, which they adapted to their own particular communities, Camp Fire Girls gained a greater understanding and appreciation of their world neighbours. The project, which was carried out during the entire year, focused attention on the importance of the home as the core from which happiness and unity must spring—first among individuals, then among nations.

Adapting the project to the challenges of peacetime, Camp Fire Girls planned and carried out many activities designed to promote global good will and to give them a closer relationship with their world neighbours. Through plays, folk dances, pageants, folk songs and fairs, Camp Fire Girls stressed the cultural contributions made to world civilization by various countries and, by means of books, increased their knowledge of the history, customs and habits of their friends throughout the globe.

In line with their world friendship project, Camp Fire Girls worked closely with various relief agencies, including U.N.N.R.A., and sent tons of canned foods and clothing to families in war-devastated countries. Vitally concerned with famine conditions abroad, members of the youth agency supported President Harry S. Truman's Famine Emergency committee and, as one of their food relief projects, sponsored a program known as "Bread for the Starving." Through this, the girls

pledged to do their share in observing one wheatless day each week, saving waste fats, avoiding waste of food, cultivating victory gardens so that more canned foods might be sent to Europe, co-operating with community canning centres and contributing at least one can of food to an overseas relief agency. To give the project greater force, Camp Fire Girls also enlisted the co-operation of their families and neighbours. Candy, books, scrapbooks and toys were other gifts that Camp Fire Girls sent to children in war-torn lands.

Other highlights in the youth agency's program for 1946 included the revision of the *Book of the Camp Fire Girls*. Based on a two-year nation-wide program study, it reflected the results of a poll conducted among Camp Fire Girls on their favourite leisuretime activities. The newly revised book, which was distributed to Camp Fire Girls and group leaders, contained 1,343 program suggestions which were based on the 7 Camp Fire crafts, namely, home, outdoors, creative arts, frontiers (science), business, sports and games and citizenship. In addition, the book also considered the factors important in the girls' personality development, as advanced by outstanding group leaders, Camp Fire executives, national staff members and program consultants.

In Nov. 1946 the organization held its first postwar national conference in Cleveland, O. Approximately 1,300 youth leaders attended the conference, which had for its theme "The New Frontier—Human Relations." During the five-day session, delegates voted to back the charter of the United Nations, and to implement that policy in its program and activities for girls. Workshops for both professional staff and volunteer workers were held each day of the conference.

Mrs. James C. Parker of Grand Rapids, Mich., was named president of the National Council of Camp Fire Girls at the convention, succeeding Dr. Bernice Baxter of Oakland, Calif. Others elected were Earle W. Brailey, chairman of the organization's board of directors; Glenn O. Hoffhines, treasurer, and Mrs. Frank C. Love, secretary. Miss Martha F. Allen was national director of the organization, which has its national headquarters at 88 Lexington avenue, New York 16, N.Y. (M. S. BN.)

Canada, Dominion of. A dominion of the British Commonwealth of Nations (Statute of Westminster, 1931, 22 Geo. V. c.4) covering all portions of North America north of the United States except Newfoundland, Labrador and Alaska. Canada is a federal union of nine provinces united under the terms of the British North America act (a statute of the imperial parliament, 1867). The original provinces were Nova Scotia, New Brunswick, Quebec, Ontario; to those were added Manitoba, 1870; British Columbia, 1871; Prince Edward Island, 1873; Alberta and Saskatchewan, 1905. Outside the provincial boundaries are the Yukon and the Northwest Territories, which are under the jurisdiction of the national government. The area is 3,694,863 sq.mi., of which 228,307 sq.mi. are water; pop. 11,506,655 (census of 1941); 12,119,000 (dominion bureau of statistics est. on June 1, 1945). The capital is Ottawa (pop. 1941 154,951). Montreal is the largest city (pop. 1941 903,007). Provincial capitals and their population (1941 census) in order of the provinces listed above are: Halifax (70,488); Fredericton (10,062); Quebec (150,757); Toronto (667,457); Winnipeg (221,960); Victoria (44,068); Charlottetown (14,821); Edmonton (93,817); Regina (58,245). Other leading cities (1941 census) are: Vancouver (275,353); Hamilton (166,337); Windsor (105,311); Calgary (88,904); London (78,264); Saint John (51,741); Saskatoon (43,027); Three Rivers (42,007); Sherbrooke (35,965); Fort William (30,585); Kingston (30,126). Canada's 17th governor general, Viscount Harold Alexander of Tunis, took office on April 12,

1946, succeeding the Earl of Athlone.

Introduction.—1946 was a year of transition, marked by many difficulties, but Canada achieved a measure of stability and prosperity greater than that experienced by many other countries.

Industrial reconversion from war to peace was practically completed; business volume, while shrunken from wartime peaks, was nevertheless higher than for any other peacetime period; commodity price increases were experienced, but the rise in living costs was relatively moderate; many government controls were relaxed, without violent reaction, and flexibility was restored to the nation's economy. Although bitter and widespread labour disputes did handicap production, agricultural and industrial incomes were high for peacetime, banks received greater deposits and foreign trade was the highest of any peacetime period in history.

On July 24 the Honourable Brooke Claxton, then minister of health, cited the following facts in a national radio broadcast. Production of peacetime goods reached a record level; more Canadians were employed than ever before in peacetime; savings of individual Canadians were highest on record, three times greater than in 1939; Canadian farm debts were enormously reduced throughout the year. During World War II national debt increased less in Canada than in the United Kingdom and the United States of America; the 1946 cuts in taxes from the wartime high were greater in Canada than in the United Kingdom, the United States of America, Australia or New Zealand; Canadian prices were more effectively controlled than in those countries.

Government.—Politically, Canada was relatively quiet throughout 1946. There was one two-member by-election in British Columbia in which coalition candidates defeated Co-

operative Commonwealth Federation candidates; one in Saskatchewan in which the C.C.F. held a seat; three in Quebec which were won by Premier Maurice Duplessis' Union Nationale; two in Prince Edward Island in which the Liberal government lost one and won one. There were four federal by-elections, all of which created great interest. The Social Crediters won the Quebec riding of Pontiac, previously held for many years by the Liberals, and it was the first Social Credit win outside of Alberta; the Progressive Conservatives held the riding of Parkdale, Ont., and took the riding of Portage la Prairie, Man., from the Liberals; after these three defeats, the Liberals won a victory in Richelieu-Verchères, Quebec.

These by-election losses reduced the Liberal majority in parliament (standing on Dec. 31 being: Liberals, 126; Progressive Conservatives, 67; Co-operative Commonwealth Federation, 28; Social Crediters, 14; others, 9; vacant, 1). Nevertheless, Prime Minister Mackenzie King continued on the one hand to guide the affairs of the nation firmly and on the other hand to watch cautiously the shifts of public opinion.

There was some talk throughout the year of a change in Liberal party leadership, based on King's statement during the 1945 election that he would never fight another election, but King bluntly said he would continue in the leadership for an indefinite period. On May 12, King's political record equalled that of the younger William Pitt (18 years, 11 months, 3 days), and on June 7, King passed the longest term of service of any British commonwealth prime minister—that of Sir John A. MacDonald, who served 19 years less three days.

In Dec. there were a number of cabinet changes as follows: J. L. Ilesley from finance to justice; Douglas Abbott from de-

SNOWMOBILES of "Exercise Musk Ox," Canadian army experiment to test arctic equipment, starting northward on Feb. 15, 1946, on their 81-day trek across the frozen wastes from Churchill, Man., to Edmonton, Alta.

fense (army, navy) to finance; Colin Gibson from defense (air) to state; Brooke Claxton from health to defense (army, navy, air); Paul Martin from state to health. Justice Minister Louis St. Laurent, who had been justice minister and external affairs minister from Sept., dropped the justice portfolio. Although there were eight vacancies in the senate, only one was filled when Paul H. Bouffard, Quebec, was appointed. The year-end senate standing was: Liberals, 66; Progressive Conservatives, 23; vacant, 7.

Parliament sat from March 23 to Aug. 31, and much important legislation was passed. Laws were drawn up relating to the development and control of atomic energy, housing promotion, reciprocal income tax between Canada and the United Kingdom, credits to foreign countries, foreign exchange, sale of wheat abroad, taxation of co-operatives, parliamentary redistribution (including the increase in the number of seats from 245 to 255). A new Canadian citizenship law was passed on May 14 and proclaimed on July 1, but the provisions did not go into effect until Jan. 1, 1947. Among other things, that important act established Canadian citizenship, gave Canadian women the right to decide their own nationality after marriage, maintained the status of British subjects. There were 12 new laws concerning veterans of World War II which created a system of government-backed bank loans for veterans wishing to establish themselves in business or the professions, gave universities the means of aiding veteran-students with loans, extended veterans' benefits to overseas fire fighters. The budget was brought down in June. Highlights included substantial personal income tax reductions, reduction of corporation and excess profit taxes, permission to farmers, fishermen and authors to pay income tax on the basis of their average income over a three-year period. The government decided to retain in operation indefinitely the following crown companies: the Polymer corporation, makers of synthetic rubber; Canadian Arsenals Limited, explosives; the Eldorado Mining and Refining company, uranium. On July 11 the joint senate-commons flag committee approved the red ensign design with the maple leaf in the fly for a national flag.

Other important government decisions included the discontinuation of national registration, establishment on July 5 of the Canadian dollar at parity with the U.S. dollar, amnesty as from Aug. 15 for the 14,000 army absentees and deserters unapprehended at that date. During the year various government loans were made to foreign countries: \$1,250,000,000 to the United Kingdom, \$242,500,000 to France, \$100,000,000 to the Netherlands, \$60,000,000 to China. The credits were for the purchase of Canadian goods. The first postwar Canadian savings bond issue was offered on Oct. 15, and within a fortnight had produced \$257,947,600. Since the new security met a substantial public demand, the government decided to let the bonds remain on sale indefinitely. On Jan. 21 the privy council upheld the validity of the Canada Temperance act; on Oct. 23 it denied Quebec ownership of bank deposits unclaimed after 30 years; on Dec. 2 it upheld Canada's right to deport Japanese.

Dominion-Provincial Relations.—In January the dominion-provincial conference resumed sessions to consider the federal government's ten-point program for a financial agreement to replace the 1942 taxation arrangement. Most important of the proposals was that dominion subsidies be increased to a minimum of \$12 per head on the basis of the 1941 census and be further increased in accordance with rises in population and value of gross national production, that the provinces withdraw completely from the personal, corporation and estate tax fields. On Jan. 6, Premier George Drew of Ontario opposed the dominion suggestions and made counterproposals. Premier Maurice Duplessis of Quebec also stood aloof. On Feb. 1 the con-

ference adjourned without agreement.

The conference reconvened on April 25 and the federal government made new proposals: that the minimum subsidies should be \$15 per head, with special grants to British Columbia and Prince Edward Island; that the dominion would withdraw from the gasoline, amusement and pari mutuel tax fields if the provinces agreed to a financial equivalent; that the proposals be given a three-year trial. The federal government stated that if the provinces retained succession duties and minor taxes, the dominion would have to withdraw its offer to pay 50% of the cost of old age pensions. Alternatively, Premier Drew offered to "rent" personal and corporation taxes if the federal government vacated the field of succession duties, gasoline, amusement and other taxes. Premier Duplessis also offered to "rent" income taxes and part of the provincial corporation tax, but refused to relinquish succession duties. Nova Scotia was willing to give up the three main tax fields if the basis of the federal subsidies were changed. Alberta, Prince Edward Island, British Columbia, Saskatchewan and Manitoba appeared to favour the new federal proposals. On May 3 the conference again adjourned without agreement.

Facing the determined resistance of Ontario and Quebec, the federal government decided that, rather than conclude an en bloc agreement with the provinces, it would make separate agreements. On Oct. 31 it was announced that New Brunswick had reached agreement on the substantial points of the new taxation arrangement. By Nov. 12 Manitoba and Saskatchewan had signed agreements. Two days later Nova Scotia rejected the federal proposals, thus standing beside Ontario and Quebec, and on Nov. 22 Alberta joined the latter group. Early in Dec. the federal government made new proposals, including an offer to vacate the important gasoline tax field, in the hope of drawing Nova Scotia into the agreement. On Dec. 12 the federal government came to agreement with British Columbia by offering an increased subsidy and by leaving that province a clear field in the gasoline, electricity and some other minor tax fields. Almost as soon as these details were made public, Manitoba, New Brunswick and Saskatchewan protested that the terms British Columbia had received were more favourable than those in their own pacts. And although Prince Edward Island announced on Dec. 23 that it had accepted "in principle" the federal government proposals, the year closed on dominion-provincial relations with a definite threat that the whole problem was going to be entirely reopened in 1947.

Labour.—During 1946, work stoppages cast a long shadow over the Canadian economic scene. Prolonged strikes were reflected in reduced production schedules and shutdowns in non-striking industries and in serious delays in building construction. In the first nine months of the year more time was lost directly because of strikes than in any comparable Canadian period from 1901, when strike records were first kept. The loss amounted to 4,069,434 man-days, compared with 353,886 man-days for the same period in 1945. Industries involved included steel, brass, copper, textiles, rubber, electrical apparatus, automobiles, logging, sawmill operation, Great Lakes shipping. In addition, some 50,000 farmers in Alberta and Saskatchewan conducted a four-week nondelivery strike. A unique aspect of the steel strike was the use of aeroplanes: the Steel Company of Canada in Hamilton made a landing strip on company property and used aeroplanes to service the 2,500 nonunion workers who remained on the job inside the picket lines; the United Steel Workers of America hired a plane to drop propaganda leaflets on the plant, guaranteeing safe conduct through picket lines to those workers who remained on the job.

In view of this strike picture, it was not surprising that on Aug. 17 the industrial relations committee of the house of

PLOWING VIRGIN LAND on the co-operative farming community at Matador, Sask., Canada, in 1946

commons made its report to parliament and included the following recommendations: a dominion-provincial conference to draft a new labour code; a more effective picketing law; some form of checkoff for certified unions; power for the labour minister to take strike votes under government supervision at the request of either party to a dispute and before or after a strike has started. This latter provision was attacked by the annual convention of the Canadian Congress of Labor on Sept. 23.

Employment.—The core of the reconversion problem, of course, was the impact on local areas. In large centres like Montreal, Toronto, Hamilton, with well-established and diverse industries, with large transportation facilities, readjustment problems were held at a minimum. But in places like Amherst, Arvida, Sorell, Fort Erie, Welland, Fort William, where wartime employment was inflated, conversion created problems. Alternative employment opportunities, when war plants shut down, were insufficient to absorb laid-off workers. The flow of these unemployed to areas where job opportunities existed was retarded by the reluctance of the workers to leave their homes, by lack of housing in employment areas, by unwillingness of workers to drop from high-income war jobs to low-income peace jobs. Moreover, as noted, shortages hampered reconversion and limited the number of available jobs. Despite these features, by Nov. 1946 unemployment had dropped to 134,000, which was less than 3% of the total labour force. That compared very favourably with the situation in Nov. 1945, when 267,000 war workers were unemployed and 600,000 war veterans were streaming home looking for jobs.

Economic Controls.—The government retained a firm hand on the major economic controls. Although on Jan. 31 price ceilings on some 300 items were suspended and on April 14 an additional list of suspensions was announced, the basic living elements remained unchanged, as the government fought the inflationary spiral. Rations remained on butter, sugar and meat, and the rent ceilings were retained. However, on Nov. 30 war-

time wage and salary controls were abolished, and on Dec. 31 controls on coal and other solid fuels ended. While the Canadian cost-of-living index stood at 100.8 on Aug. 1, 1939, it stood at 119.9 on Nov. 1, 1945, and 127.1 on Nov. 1, 1946.

External Affairs.—In his radio address on July 24, the Hon. Brooke Claxton had said that Canada's work in international co-operation had given it a reputation second to no other country. That statement was dramatically illustrated during the first part of the United Nations assembly meeting in London early in the year when Canada withdrew in Australia's favour during the elections to the security council. Prime Minister King and the Hon. Brooke Claxton were Canada's leading delegates at the Paris Peace conference where Canada played a unique role as leader of the middle-sized nations. Canada was represented on nine of the ten peace conference committees which considered in detail five draft peace treaties. In a significant speech to a plenary session of the conference, the Hon. Brooke Claxton said: "The peace and prosperity of peoples everywhere depend on the ability of the great powers to translate into agreement the cries of 2,000,000,000 people of every race and color and in every corner of the earth who desperately want an end to war and to the uncertainty which leads to war. They want a first instalment of that better world for which we hoped and worked and fought and which it is in our power to have."

Canada sent an impressive delegation to the second part of the United Nations assembly in New York in September. At that meeting Canada urged the United Nations speedily to equip the security council with power to enforce proper decisions to maintain world peace; called for world-wide armaments reduction, "so that the productive capacity of the world thus conserved may be used for improving the living conditions of all peoples"; opposed the end of the veto power, but demanded that it be exercised "with restraint and in the interest of the United Nations as a whole"; amended the proposed world arms reduction plans so that any program adopted by the security council must be approved by a special session of the 54-power

general assembly in addition to ratification by member states; carried another suggestion that any arms reduction program provide for the control of atomic energy, "to the extent necessary to ensure its use only for peaceful purposes"; won unanimous approval for its proposal to set up a committee to study means of speeding up procedure in the assembly. Canada had the chairmanship of the economic and social council refugee sub-committee, which prepared a report recommending against the forcible repatriation of refugees, other than known quislings or war criminals. Canada led the way in establishing an impartial fact-finding committee to collect for donor countries authentic information regarding relief food needs. Canada provided \$2,177,245 as its share of the United Nations budget.

Canada was also present at other international gatherings. These included the U.N.R.R.A. meeting in Switzerland, the World Food conference in Copenhagen, Denmark, the Caribbean area aviation conference. Labour minister Humphrey Mitchell was elected conference president at the International Labour organization's 29th session in Sept. in Montreal. In Dec. Canada was one of the 41 nations signing the Narcotics convention. Dr. Victor Doré, leader of the Canadian delegation to the United Nations Educational Scientific and Cultural organization, was elected to the executive board.

U.S.A. and Canadian Relations.—Three times during the year 1946 international leaders made reference to Canada-U.S.A. co-operation. President H. Truman of the United States said that "the world as a whole desperately needs to profit from the example of Canadian-American co-operation." The Hon. Ray Atherton, U.S. ambassador to Canada, described the co-operation as an example "of great importance to the whole world." At the Paris Peace conference, Canada urged the establishment of a tribunal similar to the Canadian-U.S. joint commission for the projected free state of Trieste.

At the end of July the national sites and historic monuments board unveiled a cairn to the memory of Franklin D. Roosevelt at Campobello Island, off the New Brunswick coast. A joint committee of the United States interior department and the Canadian mines and resources department examined a proposal to establish an international memorial park to President Roosevelt in the Thousand Islands near the Ivy Lea bridge over the St. Lawrence river. A treaty between the United States and Canada on the conservation and development of Great Lakes fisheries was signed in April.

During 1946, 18,280 Canadians were granted visas to enter and live in the United States. During the month of Oct. 629,700 U.S. automobiles entered Canada, highest monthly total for a decade.

World War II.—During 1946 there were still a number of major echoes of World War II. On Jan. 12 the U.S.-Canada War Production committee was dissolved. An antisubmarine mine was discovered on Oct. 2 floating near the entrance of Halifax harbour, menacing shipping, and was destroyed by a navy mine disposal crew. National defense headquarters reported that out of \$1,756,367,389, total cost of the British Commonwealth Air Training plan, Canada contributed \$1,589,954,609. Canadian service casualties in the six years of World War II were announced as 104,925, including 41,371 killed. While the army and navy had completed the search for their missing in action, the royal Canadian air force was still looking for 10,000 personnel "missing—believed killed." By early Nov. 40,889 European war brides of Canadian soldiers and 19,361 children had reached Canada.

By the end of 1946 more than 95% of the roughly 1,000,000 Canadians who served in the armed forces had found peacetime occupation. More than 35,000 veterans were attending 29 Canadian universities on their rehabilitation benefits. The rehabilita-

"GETTING IN HIS HAIR," a cartoon drawn in 1946 by Jerry Costello of the *Knickerbocker News* (Albany, N.Y.) during the investigation of espionage activities of foreign agents in Canada

tion costs of former service personnel reached its peak about mid-1946. The total was about \$749,000,000, of which \$659,000,000 went directly into gratuities, grants, and educational assistance. When the year closed only 1,800 Canadian troops and 7,000 dependents of Canadian servicemen remained in the United Kingdom and northern Europe.

On Dec. 22 the last of the 3,500 German prisoners of war sailed from Halifax. A new medal for service personnel was struck, called the war medal, and corresponded to the victory medal struck after World War I. Three additional Canadian winners of the Victoria cross were announced: John Robert Osborne, infantry man, for bravery at Hong Kong; Andrew Mynarski, Winnipeg airman who lost his life in an attempt to save his trapped rear gunner when his aeroplane caught fire over Germany; John Weir Foote, padre, for heroism at Dieppe. This brought to 16 the number of Canadians who won the Victoria cross in World War II, half of them posthumously.

Defense.—The government gave attention to defense matters. The royal Canadian navy's postwar strength was set at 10,000 permanent force with an active fleet of a carrier, two cruisers, eight destroyers, and smaller ships. A reserve force of 18,000 was established. The army was a permanent active force of 25,000 highly trained war-equipped men, plus a reserve force of 180,000 men. The permanent Canadian air force was set at 16,000 men, with auxiliaries in reserve. A defense research board was established as a civilian aid to the military forces in their effort to keep pace with modern scientific battle methods.

On Feb. 15 a special arctic expedition, called "Operation Musk Ox," left Churchill and travelled 3,100 mi. by snowmobile through the northern limits of Canada and reached Edmonton on May 6. In Oct. it was announced that Churchill would become an experimental test tube area for the development of

Canada's cold-weather military equipment. The presence of U.S. army observers in these activities underlined the conviction of U.S. and Canadian military officials that Canada's arctic region was the most vulnerable point of hemispheric defense. In Dec., when the three defense divisions were merged, a program of consolidation of Canada's military headquarters began.

Espionage Trials.—The biggest single 1946 news story was the discovery of wide-scale espionage. A royal commission was appointed to examine the matter, and, among other things, reported that the soviet union operated several spy rings in Canada, obtained extensive secret information, flew samples of stolen uranium to Moscow, imported extra soviet agents into Canada with the possibility of sabotage. No fewer than 14 Canadians "in positions of trust" were members of the soviet organization; 9 more were involved in organizing work. Charges were laid against 18, and by Dec. 31 the score was: 8 guilty and sent to prison, 1 guilty and fined, 5 freed, 4 awaiting trial.

Food and Agriculture.—More than one-fifth of the total food supplied to needy countries during 1946 was from Canada. Canada was almost alone among the supplier nations in living up to its commitments. The basis for Canada's success in this program was the steps taken by the government when, on March 17, it laid plans to meet the threat of world famine. These plans included a 10% reduction below 1945 of wheat released for human consumption in Canada, reduction by 50% of wheat released for distilleries, a campaign urging maximum production of foodstuffs. Moreover, Canada was fortunate in having a wheat harvest of 440,000,000 bu., second largest on record.

A \$1,000,000,000 wheat agreement between the United Kingdom and Canada was announced on July 25. Other agreements followed in quick succession, calling for the shipment of 1,750,000 cases of eggs per year, 120,000,000 lb. of beef per year, 2,250,000 boxes and 300,000 bbl. of apples.

Looking toward the time when world antifamine measures would include vast storehouses of food, the federal government opened an insect laboratory in Winnipeg to investigate methods for controlling insects which damage stored food.

Transportation.—Expansion of the Trans-Canada Air Lines linked Ottawa with New York, Chicago, Cleveland. The T.C.A. made its 1,000th transatlantic crossing. A flight from Prestwick, Scotland, to Vancouver, British Columbia, took 19 hours. The U.S. Civil Aeronautics board authorized a new northwest passage air route which placed Edmonton as a vital air base on an orient line. The government withdrew from its 1944 policy which planned to separate air lines affiliated with railways, and the Canadian Pacific railway was allowed to retain control for a year beyond the deadline of May 31. The department of national health and welfare established a new division of civil aviation medicine, responsible for directing the development and maintenance of standards for persons engaged in civil aviation. Montreal was chosen as headquarters for the Provisional International Civil Aviation organization.

On April 3 Canada formally took over 1,500 mi. of the Alaska highway from the United States of America. Included were seven air fields scattered between Edmonton and Whitehorse.

Canada's merchant marine picture was improved considerably following sales of many government-owned vessels to private operators. The Hudson bay route, centring on Churchill, was reopened after a six-year doldrum enforced by World War II. Canada Asiatic Lines received its charter on Nov. 15, giving further direct steamship service to the orient. Expansion of the Canadian Pacific steamships cargo and passenger fleet, and the centring of four other steamship lines on Saint John, gave that port its first post World War II boom, and started it back to its prominent position as a Canadian winter ocean port.

Industry.—There were a number of industrial expansions

which contributed notably to the increasing stature of the dominion. Canadian mining production hit an all-time high for peacetime activity, with a total value of \$503,900,000, which was only 10% below the wartime record of \$596,700,000 set in 1942. Greatest oil search in Alberta's history got under way when five oil companies combined operations to build a 70-mi. road into a 200,000-ac. swampland oil site in the Little Smoky river area north of Jasper, and sink test wells. Steps were taken to erect a tantalum refinery in Edmonton, to make Canada one of the chief sources of that nontoxic metal, invaluable in surgery, and, because of its resistance to high temperature, important for jet propulsions. A parallel development was arrangements to build a titanium dioxide plant at Cap de la Madeleine, Quebec, to make Canada self-sufficient in that valuable white pigment.

North.—Most important arctic aviation development was the 10,925-mi. nonstop flight of the U.S. Superfortress, "Pacusan Dreamboat," across the Arctic circle from Honolulu to Cairo; although high-frequency radio transmission was blacked out repeatedly, communication through low-frequency radio stations was successful.

Canadian scientists revealed that the north magnetic pole was 85 mi. north of Fort Ross, isolated Hudson's Bay company fur trade post on Somerset Island. The previous position determined by Roald Amundsen in 1904 was on the Boothia peninsula, which meant that the pole drifted 200 mi. north and east in 42 years.

Yellow Knife in the Northwest Territories outgrew its town site and was forced to move, which involved the construction of a \$1,000,000 modern sewage and water works system, most northern in Canada.

Science.—The government, in establishing an atomic energy control board, revealed that up to 1946 Canada had spent approximately \$27,000,000 on research and development in the field of atomic energy. The administrative control of Canada's atomic energy plant at Chalk River, Ont., was brought under the direction of the board, with the National Research council in charge of the physical operation of the project. Parliament voted \$60,000 to investigate radioactive ores wherever discovered in the dominion. A 25,000,000-volt atom-smashing cyclotron, capable of producing a beam of 100,000,000 volt protons, was completed at McGill university, Montreal.

During the year there were a number of significant developments in the field of applied science. In the mining field, a magnetometer, developed during World War II to locate submerged submarines, was towed over mineral areas by an aeroplane to locate ore bodies. A revolutionary steel-making process cut the melting time of ore and scrap metal to 20% of normal. A new chemical process was used to produce colour-hardened wood that was both fire-and moisture-resistant.

An Ottawa scientist constructed a camera to take 1,000,000 pictures per second. A Vancouver scientist invented an electronic piano that did not require tuning. Medical history was made when a Toronto surgeon created an artificial kidney which, attached to the outside of a patient's body and run by a small electric motor, filtered poisons and waste material out of the blood while the natural kidneys were being restored to health.

Radar experiments by the National Research council revealed that the sun's temperature is 1,500,000 degrees, which completely upset previous calculations that it was only 6,000 degrees. In 1946 Canada's National Research laboratory was the only place in the world where scientists, using ten cm. radio waves, were taking the sun's temperature and listening to "noises" coming from the sun's ever-raging fires.

Communications.—On Dec. 19 Canada celebrated the 100th anniversary of the inauguration of the first electric telegraph

service, which was between Toronto and Hamilton. The Canadian Broadcasting corporation began full-time frequency-modulation broadcasting in the Montreal and Toronto areas. The royal Canadian air force set up the first direct radio-teletype to operate between Canada and the United Kingdom. Canada's first successful frequency-modulation two-way radio communication system for transmitting railway traffic orders was used by the Canadian Pacific railway on its 166 mi. of lines inside the city of Toronto.

Culture.—The first Canadian degree ever granted in journalism was given by Carleton college, Ottawa, on Oct. 23. The first honorary degree ever conferred by radio was granted by the University of Montreal to Jean Robert Mazet, rector of Caen university, France, in a two-way international short-wave broadcast. Canada made its first organized bid for movie recognition when three companies were formed—Quebec Productions, Renaissance Films Incorporated, Dominion Productions Limited. First film to be shot was based on the legendary bush pilots of Canada's northlands. The government of Alberta was the first province to make a financial grant for organizational work in the cultural field. Canadian archivists, forced out of France in 1940 by the blitzkrieg, returned to Paris in 1946 to continue their work of collecting and copying documents and maps pertaining to the French era of Canadian history. (See also BUSINESS REVIEW.) (C. Cy.)

Canadian Literature.

Fiction.—Although 1945 was a record year in Canadian book publishing, it was outstripped by 1946 in both quantity and variety. More than ten first-novel writers appeared, most of them demanding major attention. Edward F. Meade's *Remember Me* was a gripping if bitter story of a Canadian soldier fighting throughout World War II. War correspondent Ralph Allen's *Home-Made Banners* described the ordinary Canadian soldier's reaction to World War II. *Wind Without Rain* by Selwyn Dewdney chose Canadian public school teaching as its theme; *Who Has Seen The Wind?* by W. O. Mitchell had its setting in a Canadian prairie town. A number of first novelists used Quebec settings: Joyce Marshall's *Presently Tomorrow* was an ironical study of sex and character, laid in the eastern townships; Eric Cecil Morris' *A Voice Is Calling* amusingly explored the fourth dimension in a French-Canadian village; Marion Greene's *Down River Lies the World* described early days in Montreal and what is now Hull; Constance Beresford-Howe's *The Unreasoning Heart* was a light story of a Montreal family's escapades. Lillian Beynon Thomas' *New Secret* dealt with problems arising out of the atomic bomb. Gladys C. Meek's *The Devil's Punchbowl* had a northern Canadian setting.

Established novelists also produced new work. Leading historical novel was Thomas H. Raddall's *Pride's Fancy*, about sailing ships plying between Nova Scotia and the West Indies. Other historical novels included Grace Tomkinson's *Welcome Wilderness*, first generation of United Empire Loyalists in New Brunswick; Caroline Seaford's *They Grew In Beauty*, Quebec in the Victorian era. Mazo de la Roche produced her tenth book in the Whiteoaks family saga, *Return to Jalna*. Alan Sullivan's *The Cariboo Road* dramatized the gold-rush period in British Columbia. Charles Clay's fourth novel, *Muskrat Man*, dealt with muskrat fur farming in northern Manitoba. Maude Hill Beaton's third novel, *A Ring in the Grass*, was about farming in the Maritimes.

Novelist Will R. Bird published a collection of short stories about Nova Scotia and Newfoundland, *Sunrise For Peter*. Another collection was Illingworth H. Kerr's *Gay Dogs and Dark Horses*, with settings in Saskatchewan. A posthumous collection of Stephen Leacock's humorous writings appeared, *The Leacock*

Roundabout.

Nonfiction.—The scope and variety of 1946 nonfiction underlined a new awareness by Canadian writers of literary values and needs. Many of the books dealt with specific Canadian problems. They included *Colony to Nation* by A. R. M. Lower, *The Road to Nationhood* by Wilfrid Eggleston, *This Nation Called Canada* by David B. Harkness, *Canadian Representation Abroad* by H. Gordon Skilling, *Economic Geography of Canada* by A. W. Currie, *Charters of Our Freedom* by Reginald G. Trotter, *Canadian Agricultural Policy* by Vernon C. Fowke, *Territorial Government in Canada* by Cecil Lingard, *Democratic Government and Politics* by J. A. Corry, *Political Economy in the Modern State* by Harold A. Innis. A number were regional in nature: *The Northland: Ontario* by O. T. G. Williamson, *Quebec Through The Years* by W. C. Woodley, *Kaleidoscopic Quebec* by Amy and Thornton Oakley, *The Lure of Montreal* by W. P. Percival, *Ottawa Old And New* by Lucien Brault.

There were a number of interesting books about the ever-fascinating Canadian North. In *Igloo for the Night*, Mrs. Tom Manning described two and a half years with her explorer-husband on Baffin Island. Hudson's Bay company trader Bruce D. Campbell reported his experiences in the eastern arctic in *Where the High Winds Blow*. A particularly distinguished northern book was Theodora C. Stanwell-Fletcher's *Driftwood Valley*, which recounted a two-year sojourn in an isolated valley in far northern British Columbia. Others were archaeologist Douglas Leechman's *Eskimo Summer*, explorations on the Button Islands; explorer Vilhjalmur Stefansson's *Not by Bread Alone*, Eskimo diet; engineer J. B. MacDougall's *Two Thousand Miles of Gold*, Canada's mineral exploitation.

A number of books based directly on World War II appeared. Most striking was *Haida* by Lt. Com. William Sclater, the thrilling story of Canada's great destroyer; most controversial was *Missing From the Record* by Col. Dick Malone, O.B.E., former chief of Canadian army public relations, which gave the so-called inside story of the Canadian high command in Europe and the far east. *Odyssey Through Hell* by Raymond Arthur Davies was a journalist's story of Jewish Europe under the nazis' heel. *The War: Sixth Year* by Edgar McInnis rounded out a series of annual volumes which gave a graphic and authentic running account of the war; *The R.C.A.F. Overseas: the Fifth Year* completed the official story of Canadian airmen.

There were some important biographies and autobiographies. Three chose the Canadian hero of insulin as subject: *Sir Frederick Banting* by Lloyd Stevenson, *Banting's Miracle* by Seale Harris, *He Conquered Death* by Margaret Mason Shaw. *G. A. Reid* by Muriel Miller was the official biography of that Canadian artist. *Canadian Novelists* by Clara Thomas rounded up impressive evidence of Canada's literary activities between 1920 and 1945. Harold A. Innis edited the *Diary of Alexander James McPhail*, leader in co-operative marketing in Canada. Leading literary autobiography of the year was novelist Frederick Philip Grove's *In Search of Myself*. *Growing Pains* by painter Emily Carr, published posthumously, was the last of four autobiographical books.

A number of nonfiction books held special interest. In *A River Never Sleeps* Roderick L. Haig-Brown described year-round fly fishing in British Columbia. Jack Hambleton's *Fisherman's Paradise* was a gold mine of information about fishing in Ontario. *Ojibway Melody* by Harry Symons wittily described vacation adventures near Georgian bay. A major anthology was *A Pocketful of Canada* edited by John D. Robins, instantly labelled "characteristically Canadian in mood and content." Other nonfiction books were: *The Complete Ski Manual* by Eddie Huber and Norman Rogers, *Let's Ski* by Marion Lineweaver, *Oldest McGill* by Edgar Andrew Collard, *Young Canada Goes*

to Work by J. H. Stewart, *Careers for Women* by Lillian D. Millar, *Painters of Quebec* by Marius Barbeau, *The Makers of History* by Anne Foster, *Make Selling Your Career* by Percy W. Ward, *Loyalist Narratives From Upper Canada* by James J. Talman.

Poetry.—Collections of poems included *Back-Door Neighbors* by Edna Jacques, *Stairway to the Stars* by Dorothy Dumbrille, *As Ten, As Twenty* by P. K. Page, *The White Centre* by Patrick Anderson, *East of the City* by Louis Dudek, *Landfall* by Commander F. B. Watt.

Juvenile.—The 1946 crop of Canadian juvenile books was not so impressive as in the two previous years. *In Starbuck Valley Winter* by Roderick L. Haig-Brown a boy lives by his wits in the British Columbia woods. *The Silver Strain* by Katherine Pinkerton had a northern Ontario fur farm for setting. *Madeleine Takes Command* by Ethel C. Brill retold the story of the heroine of Verchères, Quebec. *High Tide at Low Tide* by Grace A. Robbins was about harvesting Irish moss in Canada's Maritimes. L. L. Knott published a *Children's Book of the Great Lakes* and Mary E. Grannan a second collection of her delightful fantasies, *New Just Mary Stories*. *Gup* by Lesley McNaught Sirluck and *Where's Patsy?* by Marjorie Poppleton relied for their main interest on illustrations by their authors. Perennial Mary Graham Bonner's *Something Always Happens* described juvenile escapades in a small town. *The Earth Beneath Our Feet* by Alice Wilson presented geology for young readers in dramatic but authentic terms. A. W. Trueman told *The Story of the United Empire Loyalists*. (See also PRIZES OF 1946.) (C. Cy.)

Canadian-U.S. War Committees: see PERMANENT JOINT BOARD ON DEFENSE.

Canals and Inland Waterways. The principal canals and inland navigable waterways of the United States include the Great Lakes, the Mississippi river system, the Illinois waterway, the New York state barge canal system, the Cape Cod canal, the Chesapeake and Delaware canal, the Atlantic Intracoastal waterway extending from New Jersey to the Florida keys, the Gulf Intracoastal waterway extending from Florida to the vicinity of the Mexican border, the San Joaquin-Sacramento river system in California and the Columbia river system in the northwest.

The Great Lakes, which consist of Lakes Superior, Michigan, Huron, Erie and Ontario, have natural deep water except in the connecting channels which have been artificially deepened where necessary to accommodate deep-draught vessels. They have an outlet to the Atlantic ocean via the St. Lawrence river and via the Oswego and Erie branches of the New York state barge canal system and the Hudson river.

The Mississippi river waterway system embraces the river proper, the Red, Arkansas, Missouri, Illinois, Ohio, Tennessee, Monongahela, Allegheny and Kanawha rivers and others streams. The Mississippi river has a channel adequate for ocean-going vessels to Baton Rouge, La., and thence a channel for modern barge navigation to Minneapolis, Minn., and in its principal tributaries. In the 655-mi. reach of the Mississippi river above Alton, Ill., to Minneapolis a system of low-head dams with locks provides a 9-ft. channel depth for modern barge navigation. Below Alton the barge channel is maintained by open river works. The Ohio river and certain of its improved tributaries are also canalized to provide a 9-ft. channel for commercial navigation serving this highly industrialized region. The system of 6 locks and dams on the Ouachita and Black rivers provides depths of 6½ ft. at low water from the Red river to Camden, Ark., a distance of 351 mi. The Red river proper and the Arkansas river

have been improved for light-draught navigation throughout a total length of more than 1,000 mi. The Illinois river and waterway to Lake Michigan has a barge channel which connects the Great Lakes with the Mississippi river system. The Mississippi river waterway system, together with the Intracoastal system which it connects at Plaquemine and New Orleans, La., brings barge navigation within reach of important industrial and farming centres.

The Cape Cod canal, Massachusetts, extending from the head of Buzzards bay to Cape Cod bay and the Chesapeake and Delaware canal between the Delaware river and Chesapeake bay are sea level waterways, affording a protected and shorter route for coastwise ocean-going vessel traffic.

The Atlantic and the Gulf Intracoastal waterways provide a protected channel for barge and other light-draught navigation following coastal sounds, bays, rivers and artificial channels. This canal system, extending for more than 2,300 mi. along the Atlantic and Gulf coasts, affords a channel 12 ft. or more in depth throughout the Atlantic coast section from Trenton, N.J., to Jacksonville, Fla., and in the Gulf coast section from Carrabelle, Fla., to Corpus Christi, Tex.

The San Joaquin-Sacramento river system, with an outlet to the sea through San Francisco bay, has a deep-draught channel to Stockton, Calif., on the San Joaquin river and a moderate-draught channel to Sacramento, Calif., on the Sacramento river. The Columbia river affords a channel for ocean shipping to Portland, Ore., and Vancouver, Wash., and depths suitable for commercial vessel traffic to the head of the pool formed by the Bonneville dam, and thence depths for barge navigation upstream to and including the Snake river.

The principal items of new work performed on canals and inland waterways during the fiscal year ended June 30, 1946, included dredging in the Gulf Intracoastal waterway in Texas between Corpus Christi bay and North Bird island and between Port Isabel and Three Islands. On the Mississippi river between the Ohio and Missouri rivers, open river regulating works con-

HORSE-DRAWN BARGE taking young excursionists to see the sights along the old Chesapeake and Ohio canal near Washington, D.C., in the summer of 1946

sisting of 33 dikes and 3 revetments were completed and 6 dikes were under construction at the end of the fiscal year. On the Missouri river between Sioux City, Ia., and the mouth, 14 dikes and 31 revetments were completed, and 12,900 linear ft. of pile dikes and 13,157 linear ft. of revetment were strengthened or replaced; in addition 8 dikes and 23 revetments were under construction at the end of the fiscal year. A 1,200-ft. extension to the southwest pier in St. Marys river, Mich., was completed except for paving behind the concrete cap. Also, the reconstruction of Brady pier and construction of a mooring basin and boathouse were practically completed.

The total net water-borne commerce of the United States, eliminating all known duplications of traffic, aggregated 618,906,000 short tons in the calendar year 1945. A total of 123,901,790 short tons was carried on the Mississippi river and its tributaries, and 112,982,630 short tons were moved through the St. Marys Falls canal connecting Lake Superior and Lake Huron.

The River and Harbor act approved July 24, 1946, public law 525, 79th congress, and the act approved Nov. 7, 1945, public law 213, 79th congress, authorized 62 new river and harbour projects or modifications of existing projects having an estimated total cost of about \$525,000,000. These projects include the improvement of Portland harbour, Me.; Fall River harbour, Mass.; New Haven harbour and Bridgeport harbour, Conn.; the Schuylkill river, Pa.; Savannah harbour, Ga.; and Hollywood harbour, Fla. A waterway connecting the Tombigbee and Tennessee rivers, Ala. and Tenn.; improvement of Lake Charles deep-water channel, La.; and the Overton-Red river waterway from the Mississippi river to Shreveport, La.; and the Arkansas river and tributaries in the interest of navigation, flood control and power development were also authorized. Other projects include the Sabine-Neches waterway, Tex.; Cumberland river and tributaries, Ky. and Tenn.; Great Lakes connecting channels, Mich.; and Two Harbors, Minn. For the west coast, the congress authorized the improvement of San Diego river and Mission bay and the construction of the Sacramento deep-water channel, Calif.; Coos bay, Ore.; and the Columbia river between Vancouver, Wash., and The Dalles, Ore. (R. A. WR.)

Other Countries.—Little progress was made in 1946 other than the rapid reconstruction and clearing of inland waterways in Germany and other countries which had been severely damaged by the operations of war. The Rhine channels were largely cleared by the removal of ruined structures, most of the work being done by German labour under the direction of the Allied control commission. The Kembs barrage and locks below Basel suffered severe damage during the battle of Alsace in the winter of 1944-45. The repair of the barrage and canal by the French was substantially completed towards the end of 1946. Most of the damage by intensive bombing of the Dortmund-Ems canal was repaired by German labour under Allied direction. The ship canal from IJmuiden on the North sea to Amsterdam was restored by the Dutch to full navigational use. The removal of obstructions in the Rhine and Meuse and repair works on a considerable scale also made Amsterdam accessible by water from the Ruhr downwards. By 1946 barges of up to 4,000 tons could pass through the canal between the Rhine and Amsterdam.

Information was not available as to the repair and reconstruction of waterways in western Russia, and little was known of the postwar progress made by the U.S.S.R. with the vast scheme of waterway development begun as a part of the third five years' plan. The decisions of the peace conference in regard to the future of such international waterways as the Danube, Rhine and Oder had not been announced.

In Canada the St. Lawrence waterway project awaited the passing of the relative treaty by the U.S. senate. (See also AQUEDUCTS.) (N. G. G.)

DR. EGON LORENZ, scientist at the National Cancer institute in Washington, D.C., checking the first offspring of a mouse which survived the atomic bomb tests at Bikini lagoon in July 1946

Cancer. **Diagnosis.**—Is biopsy dangerous? The diagnosis of cancer in the more inaccessible organs is often extremely difficult and of late years puncture of the spleen, liver and other organs has been used to remove small particles of tissue which will in some instances permit diagnosis. This technique is somewhat dangerous as deaths have occurred from tearing of the organ tissue by the needle on some unexpected movement of the patient. Also the material removed is often so greatly traumatized that a positive diagnosis may be impossible. Puncture of tumours of the breast used to be practised to a considerable extent, but has been abandoned as often not leading to a correct diagnosis because malignant tissue may not necessarily be removed by the needle puncture, and secondly because distribution of the cancer may take place from trauma of the cannula. Microscopic study of chest fluids often reveals the presence of metastatic carcinoma of the lung or other organs, and is therefore useful in diagnosis. G. N. Papanicolaou and H. F. Traut recommended the diagnosis of carcinoma by studying stained smears from the vagina and cervix uteri. A large experience was available in 1946 and the amount of error in the technique was small, but implied the obtaining of suitable specimens, immediate fixation and careful study by a person experienced in the morphology of carcinoma of the organs under discussion, in other words, an expert. It is true that the majority of cases of carcinoma of the cervix can be diagnosed by inspection and of the uterus itself by examination of curettings, but the examination of vaginal smears can be made in a short time, as an office diagnostic method. However, in order to avoid error, it is well to have sections from the tumour before the patient undergoes the serious mutilation resulting from surgical operation. In other words, a positive vaginal smear is not an indication for a hysterectomy.

At regular intervals there appear in medical journals unsupported statements that the performance of a biopsy of a malignant tumour has been immediately followed by a wide distribu-

tion of the growth. Those with ample experience are perfectly well aware of the fact that tumours may lie dormant for a long period and then suddenly erupt into the vascular or lymphatic system with the appearance of a vast number of metastases. Especially is this true if the patient or a masseuse attempted "to rub the tumour away." The fact that such massage of an inoculated tumour in an animal will distribute vast numbers of cells throughout the circulation was early demonstrated by E. E. Tyzzer. Later Francis Carter Wood at the Crocker laboratory studied the question experimentally by inoculating a large number of rats with a highly malignant tumour, and after the tumours had reached a considerable size, dividing the animals into three groups. In one, partial excision of the tumour was made; in another, the tumour was completely removed, and the third group was left as controls to check the possibility of a spontaneous disappearance. After the growths were of good size the animals were killed and the organs examined microscopically. The results in the untreated controls showed metastases were present in 32%; in the group in which simple excision was made metastases were present in 22%, and in the group in which the tumours were completely excised, metastases were also present in 22%. In other words, there was no evidence that careful removal of a small bit of the tumour played any part in distributing the growth. In this research it was apparent that in human beings during a biopsy the incision of a tumour may be carried out in such a way that a considerable amount of tissue juice is allowed to spread throughout the wound and thus cause local distribution of cells. This procedure of course is wholly unjustifiable but is still occasionally done. In the same laboratory, Leila C. Knox repeated the experiments which Tyzzer had made which showed that massage was an efficient distributor of tumour cells, and confirmed in every way Tyzzer's results. It is interesting to note that a fibrosarcoma was not transplanted by massage.

The problem was re-opened by M. E. Maun and W. F. Dunning who surveyed the previous work and added to it. A simple biopsy did not affect the survival period of the rats used or increase the percentage of metastases to the lymph nodes, lungs and skeleton of the animals used, with two types of tumours, an adenocarcinoma and a squamous cell carcinoma. The survival period of rats with a fibrosarcoma was prolonged by removal of the tumour 9 days after inoculation, and of rats with an adenocarcinoma by removal of the tumour 90 days after inoculation. The authors concluded that reasonably cautious removal of a fragment of a tumour is not necessarily dangerous to the host. They believed they had shown that cutting into a tumour mass or severing the lymphatic channels does not shorten the individual's life, but acknowledged that the surgical removal of all removable tumour tissue in a seemingly hopeless patient may prolong life for several years. Practically the conclusion to be drawn from work of this type is that if possible, and a trained assistant is available, the tumour should be exposed and a biopsy made by means of rapid section, and the operation immediately completed. During the few minutes which the diagnostic procedure requires, the incision can be cauterized by chemicals or by heat.

Tissue Culture as a Biological Method.—For some seven years Dr. Wilton R. Earle, a member of the staff of the National Cancer institute in Washington, carried on a series of studies on the cultivation of connective tissue fibroblasts growing in artificial media. Cultures were grown in flasks and in some instances solid culture media were used consisting of chicken plasma diluted with saline, horse serum and chick embryo extract. The supernatant fluid was composed of 40% horse serum, 20% embryonic extract, and 40% saline. The cultures were washed and the medium changed every three days. The glassware was cleaned with a mixture of hot sulphuric and nitric acid. In the first series of studies it was noted

that after the addition of very minute quantities of 20-methyl cholan-threne there was a very great retardation of the rate of increase of the diameter of the area of the growing cell clumps and that the degree of retardation was correlated with the concentration of the carcinogen. At the end of about four months cultures were removed from the carcinogen. Microscopically there were a great many changes in morphology; the cells which had been treated were much shorter than the normal controls and no longer showed the slender terminal processes. The cells also were more closely packed. A few animals were injected with cell masses, but no malignant change could be demonstrated. On the other hand, some of the controls which had never been treated with carcinogen showed a similar retardation of growth. In other words, they were acting as though they had received a trace of a carcinogenic agent. Further cultures showed the same general alterations in morphology. Various strains of cells showed differences in morphology and the number of giant cells present and the amount of intracellular granulation. Similar differences were observed in the cells of a number of tumours produced after injection of treated clumps in which the morphology suggested an alteration into sarcoma. The anaerobic glycolytic rate of the tumour strains was high, corresponding to alterations in metabolism which had been studied by Otto Warburg. In some cultures to which methyl cholan-threne had not been added changes occurred which suggested that the normal cells had undergone spontaneous alteration into a malignant cancer. Inoculations of these cells produced tumours in the homologous strain of animals. Earle was inclined at first to think that this change in normal cultures to which carcinogen had not been added was due to contamination by the laboratory air or from the glassware. However, in a continuation of the work in which it seemed impossible that any carcinogen could reach the cultures these peculiar alterations were still occurring, showing that the normal cells growing in culture media may undergo a mutation which is sometimes of the type known as malignant, as proved by inoculation into a homologous strain of mice. This careful and arduous work certainly makes it probable that the appearance of cancer is due to a cell mutation of some type or other. This mutation may be spontaneous, or can be excited by chemicals and also by viruses in the case of the interesting milk agent which is found in mice and which will be spoken of in detail. This mutation theory is not new, but has not had definite confirmation. Earle's work and biological studies on the chemically induced mutations studied by L. C. Strong, E. L. Tatum and others showed that x-rays, ultraviolet and certain chemicals might produce in plants, micro-organisms and Drosophila mutations which are permanent.

Mammary Milk Factor.—There is a mammary milk factor in the production of cancer of the breast in mice. This problem was worked on for a number of years by Professor John J. Bittner, of the division of cancer biology, University of Minnesota Medical school, and the nature of the agent was being cleared up. If mice born from mothers of a cancerous strain are prevented from nursing their mothers, but are nursed by a strain in which cancer of the breast is infrequent, they will not develop cancer. This transfer by nursing does not require that the mother should have cancer, because the agent is transferred in the milk and is present in the organs. Even nursing for 24 hours will increase the frequency of cancer, although the mice are removed to a foster-mother who is not subject to the disease. The agent may be recovered from every tissue in the body which has been tested to date. It is not destroyed by filtration, treatment with glycerin or desiccation, but can be inactivated by pasteurization for 30 minutes. After injection of a cell-free filtrate of the agent into chick embryos a specific organism may be recovered from either filtered or unfiltered yolk. High dilution of the fluid containing agent makes no difference in the incidence of tumours. Centrifugalization at high speed removes the agent from the suspension in this fluid. All of these phenomena are characteristic of a virus, according to our present knowledge. One final test is that it has antigenic properties. The agent is not transferable to animals of other species, nor is there any evidence that the same agent plays any part in the pathology of human cancer. A certain number of statements were made by physicians and geneticists that a woman who comes from a cancer family should not nurse children. There is not the slightest basis for such a statement. (See also BIO-CHEMISTRY.)

Candy. Sales of candy continued to show an increase in 1946, the first postwar year, despite shortages of sugar and other raw materials and the lack of new equipment. The year ended with a 2% gain over 1945 sales of 2,562,000,000 lbs. valued at \$620,000,000 at wholesale and \$1,400,000,000 at retail. The average value at wholesale per pound was above 26 cents, compared with 24.2 cents recorded in 1945.

The determining factor in candy production in 1945 was the sugar quota, which remained at 60% of base period use. The demand far exceeded the available supply.

One of the most significant events in candy in 1946 was the abandoning of the traditional five-cent price on nickel candies by dealers throughout the United States. This occurred in the

fall, shortly after the decontrol of candy prices by the OPA. As a result, as the year was drawing to a close the usual five-cent candies were selling at 6, 7 and 8 cents. There was also an increase in 10-cent bars to 12-cents.

For the third year in the history of the candy industry (1944 was the first) bar type candies represented half of the industry's tonnage. Of this, five-cent bars amounted to about 90%. As in previous years, chocolate covered bars constituted the largest item in this category, representing, in fact, a greater volume than the combined sales of all other bars, including moulded chocolate bars. The second largest selling item was packaged goods, representing about 20% of total sales, as expressed in dollar value. Bulk confectionery was the third largest class of goods sold, accounting for about 50% of sales.

The year 1946 also saw the return (in limited quantities) of Christmas and other holiday specialties, such as candy canes, hollow moulded goods and jelly beans.

While the army continued to buy candy, total quantities represented only a fraction of the 20% of the production purchased by the armed forces during World War II.

The industry's 1946 tonnage was produced by approximately 1,400 candy manufacturers in Chicago, Philadelphia, New York, Boston, Minneapolis, San Francisco and other sections of the country, employing 50,000, mostly women. Illinois, the largest candy manufacturing state, accounted for one-quarter of all the confectionery produced in 1945 as well as in 1946. Pennsylvania was second, with New York and Massachusetts runners-up. A notable increase was shown in production by California, as well as Texas.

To produce the 2,500,000,000 lbs. of candy estimated for 1946, the candy industry in the United States used ingredients costing \$300,000,000. Cane sugar was the largest single item in this group, accounting for about 800,000,000 lbs. Corn syrup was second with 700,000,000 lbs. going into the annual production of confectionery. Also used by the candy industry in the United States in 1946 were 230,000,000 lbs. of chocolate, 6,000,000 lbs. of eggs, 400,000,000 lbs. of milk, 30,000,000 lbs. of fats and oils and 10,000,000 lbs. of fruits annually.

While the United States continued in 1946 to be the greatest candy-producing country in the world, 1946 saw the re-entrance of other parts of the world in the confectionery field. The most successful of European countries to re-establish the candy field was the Netherlands and as the year drew to a close many of its products were finding their way to the United States, as well as to other parts of the world.

Denmark, France, Belgium and even Germany again were making candy in 1946. No figures, however, were available in 1946 to show the total quantities produced. Next to the United States, Great Britain continued to be the most important candy-producing and consuming country in the world. The per capita consumption of candy in Great Britain continued to be about 22 lbs.

Imports of candy into the United States showed an increase in 1946. Most of this came from Latin America, with Cuba, Argentina and Mexico shipping the largest quantities. Most of the candy coming from Cuba was of the hard type variety. When candy prices were decontrolled in the latter part of 1946 monthly imports of Cuban candy almost doubled. The latest figures available for an entire year were for 1945, when Cuba shipped 49,872,000 lbs. of candy. This compares with 1,050,000 lbs. of candy in 1942. Altogether, imports in 1945 amounted to 62,575,000 lbs., valued at \$10,000,000. While no figures were available in 1946, it was estimated that there was an increase of from 50% to 100% in 1946.

Cane Sugar: see SUGAR.

Canning Industry. United States and territorial canned food production in 1946, including canned fruits, vegetables, milk and fish, totalled in excess of 600,000,000 standard cases compared with 516,000,000 standard cases in 1945. Record quantities of canned fruits, juices, vegetables and fruit and vegetable specialties were packed during the year. The 1946 pack of canned fish was about the same as in the previous year while there was a sharp reduction in canned milk production from the 1945 record level. In addition to these products considerable quantities of meat, poultry and other specialty products were packed by the canning industry.

Preliminary statistics for the major commodities in 1946 compared with 1945, in terms of millions of standard cases are as follows:

	1945	1946		1945	1946
Fruits	49.5	80.0	Specialties, fruit and		
Fruit juices	79.5	90.0	vegetable	84.0	95.0
Vegetables	194.7	250.0	Fish	18.6	18.0
Milk	90.3	73.0			

Price ceilings were effective for a large part of the canned food pack during the greater part of 1946, although decontrol of prices on canned foods began late in 1945 when sauerkraut was exempted and canned citrus products were suspended from price control. Additional vegetable products were decontrolled early in 1946 and ceiling prices lifted on other canned fruits and vegetables. In early fall there was an acceleration of decontrol actions on canned products culminating in the final decontrol action on Oct. 24 when OPA removed ceiling prices on all other canned foods remaining under price control.

In January the Economic Stabilization administration approved a subsidy program for certain canned and frozen foods for the first six months of the year. Interim subsidy payments

1,000 CANS OF PEAS being pushed into the cooking vats at the Walla Walla Canning company's plant in the state of Washington during the pea harvest in July 1946

were made on a limited number of vegetables and vegetable products through June 30 when the eligible sale was made prior to July 1, 1946. Congress failed to provide the necessary funds for a continuation of subsidies beyond June 30 and the U.S. department of agriculture did not extend its subsidy payments on any canned products packed after that date.

The Civilian Production administration, on Dec. 24, issued an amendment to the tin container conservation order M-81. The new order contained no commodity or quota restrictions on the manufacture or use of metal cans but did, for the most part, retain the can size limitations and continued to restrict the amount of tin coating to be used in the tin plate for cans. These controls were maintained to conserve pig tin, which was still in short supply. The order permitted the use of cans for packing shortening, coffee, beer, pet foods and other products which were previously banned. The canning industry maintained a practical interest in the world position of tin, which was still precarious. A current report (*Chemical and Engineering News*, vol. 24, no. 24, Dec. 25, 1946, p. 3380) stated,

The visible world stockpile of tin, which was about 167,500 tons at the end of 1941, is now down to 90,000 tons or possibly a little more, equal to about six months total consumption at the low rate of 1939.

Further in the report it appeared that for 1946 in the six eastern tin areas (Malaya, Netherlands Indies, Siam, China, Burma, Indo-China) a production of 20,000 tons was estimated, as against 160,000 tons in 1941. Recovery of world production to the 1941 peak of 244,000 tons was not expected before 1950 or 1951.

Carbon Black. Unprecedented demand for the compound- ing of synthetic rubber caused sharp increases in the production of carbon black in the United States, most of which was concentrated in 1944 and 1945. Deliveries to rubber companies in 1945 took 402,193 short tons, an increase of 9% over 1944, and 95% of the domestic sales. The salient data of the industry during the years 1940-45 follow:

Data of Carbon Black Industry in the U.S., 1940-45
(Short tons)

	1940	1941	1942	1943	1944	1945
Production . . .	284,396	297,033	287,003	296,711	400,930	526,399
Year-end stocks . .	84,794	59,429	121,378	102,108	34,622	51,003
Total sales . . .	264,887	322,372	224,966	314,650	468,715	510,018
Export sales . . .	88,809	74,083	57,818	52,456	78,496	86,887
Domestic sales . .	176,078	248,290	167,148	262,194	390,219	423,131
Rubber . . .	155,090	219,751	147,974	236,737	369,015	402,193
Ink . . .	12,079	19,099	9,616	11,765	12,239	11,412
Paint . . .	3,403	2,920	1,808	1,972	2,658	3,711
Other uses . . .	5,506	11,520	7,750	11,720	6,308	5,816
Natural gas used* .	368,802	365,377	335,533	315,562	355,770	431,830
Average yield† . .	1.54	1.63	1.71	1.88	2.20	2.32
Average value‡ . .	2.90	3.26	3.41	3.41	3.67	4.02

*Millions of cubic feet. †Pounds per thousand cubic feet. ‡Cents per pound.

The sharp rise in demand for carbon black was due to the increased use of synthetic rubber, which requires more carbon black in its compounding than natural rubber does. In spite of increased output, supplies were so short in the early months of 1945 that the War Production Board reduced the permissible content of carbon black in rubber. The reduction of military requirements with the close of hostilities appreciably increased the supplies for civilian use.

The plant capacity of the 21 producers and 59 plants in operation in 1945 was 663,132 tons, against an output of 526,399 tons, a ratio of 79% for output to capacity, as compared with 85% for 22 producers and 54 plants in 1944.

The postwar prospects for the carbon black industry were largely dependent not only on the rate at which natural rubber could be made available, but also on the extent to which it was deemed advisable to keep the war-born synthetic rubber industry in active operation as a safeguard against possible future interruptions in the supply of natural rubber. Since natural rubber requires only about half as much carbon black as synthetic rubber, a return to natural rubber would be a severe blow to the carbon black industry; on the other hand, the failure to provide a market for at least a reasonable amount of natural rubber would have even more severe repercussions on the whole economic life of such areas as Malaya and the Netherlands Indies.

Cartier de Marchienne, Emile de BARON (1871-1946), Belgian diplomat, was born on Nov. 30, and entered the foreign service at the age of 21. He held diplomatic posts in Belgrade, Constantinople, Rio de Janeiro, Tokyo and Peking (Peiping) and was later transferred to Washington, D.C., as minister, 1917. When the Belgian legation was raised to the status of an embassy in 1919, he became his country's first ambassador to the United States. He was one of Belgium's delegates to the Washington Disarmament conference (1921-22), and was also a member of the Belgian War Debt commission. He was named Belgian ambassador at London in 1927 and was dean of the diplomatic corps at the Court of St. James at the time of his death in London on May 10.

Castillo Najera, Francisco (1886-), Mexican diplomat, was born on Nov. 25 in Durango, Mexico. He studied at the State college of Durango and took up medicine at the University of Mexico's medical school, receiving his degree of doctor of medicine in 1903. He later continued his medical studies in Berlin and Paris.

Dr. Castillo Najera, who was director of the Medical school in 1920, was a member of the International commission investigating yellow fever (1921-25). In 1922, he entered the diplomatic service as minister plenipotentiary to China and later held similar posts in Belgium, Holland and France. He was also Mexico's delegate to the League of Nations and a member of the league council.

Appointed ambassador to the United States in 1935, he held this post until Sept. 2, 1945, when he was recalled to Mexico City to succeed Ezequiel Padilla as foreign minister in the Avila Camacho government; he retained this portfolio in the succeeding Alemán government.

Dr. Castillo Najera was appointed as Mexico's representative on the United Nations security council and attended the council sessions that opened March 25, 1946, in Hunter college, New York city. He supported Dr. Oscar Lange's proposal that the United Nations member states break off diplomatic relations with Spain, and upon his retirement as council chairman, July 10, 1946, assailed the council's failure to take action on the Spanish question and criticized soviet use of the veto.

Catholic Organizations for Youth. The national co-ordinating bureau for Catholic youth organizations and activities in the United States is the youth department of the National Catholic Welfare conference, with headquarters at 1312 Massachusetts Ave., Washington 5, D.C. The youth department was established in 1940 by the Catholic bishops of the United States to serve as a co-ordinating agency on a national level for Catholic youth groups and programs.

There were 121 diocesan divisions of the Catholic Church in the United States in 1946. One hundred and eight of these dioceses established diocesan programs for youth under the direction of a diocesan director. Within these dioceses, parish churches numbering over 20,000 conducted on a local basis one or more programs or organizations for children and young people.

Under the supervision of the youth department, National Catholic Welfare conference, there was set up a National Catholic Youth council which unified all approved Catholic youth groups. This youth council was composed of a diocesan section for community church groups, and a college and university section for student activities.

The college and university section of the National Catholic Youth council comprised the two national student federations approved by the national hierarchy. The National Federation of Catholic College students formed the basis of unity among the student bodies of 108 Catholic colleges in the United States. The Newman Club federation was composed of 657 Catholic student clubs in non-Catholic colleges and universities.

A number of national Catholic youth-serving programs sponsored activities for Catholic young people on a local, regional and national basis. Constituent units of such programs were found in local parishes, Knights of Columbus councils, and under the auspices of other Catholic adult groups. The following national programs were found in operation in many areas throughout the U.S.: The Queen's Work (Sodality of Our Lady), 3115 S. Grand Blvd., St. Louis, Mo.; The Catholic Student Mission Crusade, Shattuc Ave., Cincinnati, O.; the Junior Catholic Daughters, 39 Manchester Terrace, Mount Kisco, N.Y.; The Columbian Squires, 45 Wall St., New Haven, Conn.; The Catholic Central Verein, 3835 Westminster Place, St. Louis, Mo.; The Catholic Committee on Boy Scouts, 2 Park Ave., New York, N.Y.; the Junior Cross Holy Name Society, 141 E. 65th St., New York, N.Y.

A complete listing of diocesan and national Catholic youth-serving organizations was to be found in the *Catholic Youth Directory*, published by the youth department of the National Catholic Welfare conference. (C. E. BM.)

Catholic Rural Life Conference, National.

Founded in 1923 by Bishop Edwin V. O'Hara and a group of priests, this national organization is dedicated to the economic, social and spiritual interests of the U.S. farmer. The constitution adopted in 1944 pledged the conference to promote the well-being of the rural population by applying the principles of Catholic ethics to rural and agricultural problems and to strengthen and expound the Catholic faith in rural districts.

The 24th convention and first postwar meeting was held at Green Bay, Wis., on Oct. 11-15, under the chairmanship of Bishop William T. Mulloy of Covington, Ky., who became acting president upon the resignation of Bishop William A. Griffin of Trenton, N.J., as president in the spring of 1946. Eighteen bishops participated in the conference, along with priests and lay persons from some 70 dioceses of the United States and Canada.

The relief and resettlement of European refugees was a major

concern of the conference. Current trends detrimental to the family farm and stabilization of farm prices were other topics of discussion. The diocesan directors, in a special session, laid plans for the development and extension of rural retreats. At a meeting of the board of directors resolutions were adopted favouring: (1) admission into the U.S. of several hundred thousand refugees through raising of immigration barriers or pooling of quotas, some of the settlers to be given a home on the land; (2) fuller participation by the U.S. in international trade, with U.S. farmers co-operating to improve world food conditions; (3) additional governmental protection of the family type farm.

At the December meeting of the board of directors steps were taken to implement the first resolution by active participation in a refugee resettlement program in conjunction with War Relief Services—N.C.W.C. The reorganization and expansion of the central office was also decided upon.

The Most Rev. William T. Mulloy, bishop of Covington, Ky., was elected president at the Green Bay convention, and Rt. Rev. L. G. Ligutti was reappointed executive secretary. *Land and Home*, a quarterly, continued as the official publication. Permanent headquarters in 1946 were at 3801 Grand avenue, Des Moines 12, Ia. (J. LAF.)

Catholic University of America. During 1946 the Catholic University of America, Washington, D.C., expanded its faculties, curriculum and physical properties for an enrolment of 3,700 students—the largest registration in its history—of whom 1,450 were ex-service men and women. The faculties totalled 425 members, compared with a normal teaching personnel of 350. A notable addition was Dr. Lise Meitner, the Viennese physicist, who conducted graduate classes in nuclear physics in the first semester. A department of geography was added to the graduate school of arts and sciences. The school of nursing education was transferred to a new \$240,000 building. Forty members of the faculty, who had been on leave serving as chaplains and other officers with combat troops and in scientific and industrial plants during World War II, resumed their classes. The university and 25 members of the staff received army and navy awards for war research work. Very Rev. Robert J. White, dean of the law school, while serving as a navy chaplain, interviewed 500 naval prisoners and recommended changes in the naval disciplinary code. Pope Pius XII elevated Rt. Rev. Msgr. Francesco G. Lardone, director of studies for the university's ecclesiastical schools, to the rank of prothonotary apostolic. The Commission on American Citizenship, under the direction of the university, completed a new curriculum of three volumes for Catholic elementary schools. Gifts, bequests, royalties and special grants for graduate studies, including the annual diocesan collections for the university, totalled \$875,980. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (P. J. M.)

Catholic Welfare Conference, National.

The conference was organized by the bishops of the United States in Sept. 1919, to unify, co-ordinate and organize the Catholic people of the United States in works of education, social welfare, immigrant aid and other social and religious activities. The conference is conducted by an administrative board of ten archbishops and bishops, who supervise its operation and report annually to the Holy see. The conference does not exercise jurisdiction in the canonical sense, nor is it a synod or council.

The annual meeting of the conference was held at Washington D.C., Nov. 12-15, 1946, attended by 115 members of the

hierarchy. Members elected or re-elected to the administrative board were: chairman, Archbishop John T. McNicholas of Cincinnati, O.; vice-chairman, Archbishop John G. Murray of St. Paul, Minn.; treasurer, Bishop John M. Gannon of Erie, Pa.; secretary, Bishop Michael J. Ready of Columbus, O.; Archbishop Joseph F. Rummel of New Orleans, La.; Archbishop John J. Mitty of San Francisco, Calif.; Archbishop James H. Ryan of Omaha, Neb.; Archbishop Richard J. Cushing of Boston, Mass.; Archbishop Robert E. Lucey of San Antonio, Tex., and Bishop Karl J. Alter of Toledo, O. The general meeting of the conference in 1946 modified the by-laws so as to permit participation of the U.S. cardinals in administrative board meetings and to allow them to serve on special committees even if not members of the board.

The annual reports of the National Catholic Welfare conference (N.C.W.C.) departments, submitted at the bishops' meeting, summarized the conference's activities for the year 1946. The press service was used in 35 countries during 1946; the Spanish edition, *Noticias Católicas*, was subscribed to by additional Latin-American papers. The education department aided in the formation of the Catholic Commission on Intellectual and Cultural Affairs, a professional organization operating on a national and international basis, and participated in the U.S. educational mission to Japan. The Council of Catholic Men reported that its broadcast, "The Catholic Hour," was carried on 106 stations and that its audience mail had increased to 123,000 pieces from 101,411 in 1945. "The Hour of Faith," carried on another network, also continued to grow. The Council of Catholic Women had 598 affiliated diocesan and other organizations.

During 1946 the social action department participated in several international meetings, notably the second Inter-American Catholic seminar on social studies held at Havana, Cuba, Jan. 2-9. The youth department maintained relations with diocesan youth directors in 90% of the dioceses throughout the country and conducted five regional conferences, in Boston, Kansas City, Biloxi, Detroit and San Francisco, for local directors. The Confraternity of Christian Doctrine was listed as an official activity in 21 archdioceses and 91 dioceses during 1946.

The committee on refugees reported assistance to 1,693 new cases up to Oct. 1946, raising the total number of cases from Jan. 1, 1937, to 7,059. War Relief Services (W.R.S.) of the N.C.W.C. reported 679 relief shipments to 36 countries, valued at \$15,325,388, during the fiscal year Oct. 1, 1945, to Sept. 30, 1946. For 1947 the cash relief budget was set at \$5,000,000. W.R.S. of N.C.W.C. also urged Latin Americans to assist in resettling European refugees and in the United States asked that immigration quotas be modified to allow entrance of refugees.

During 1946 N.C.W.C. ceased publication of *Acta Apostolicae Sedis* as this official commentary was available from the Vatican.

National headquarters in 1946 were at 1312 Massachusetts Ave., N.W., Washington 5, D.C. The N.C.W.C. has as its official publication the monthly *Catholic Action*. (J. LAF.)

Catholic Youth Organization: see CATHOLIC ORGANIZATIONS FOR YOUTH.

Cattle. The cattle cycle, which passed a peak in 1944, continued on the downward swing in the United States in 1945 and on Jan. 1, 1946, the number of all cattle was only 79,791,000 head compared with 81,909,000 in 1945 and the record high peak of 82,364,000 in 1944. During the five years before 1944 the number of cattle increased 26%. The number of milk cows included in this total increased about 18% in five years and showed only a slight decline in numbers in 1946. The

IDENTICAL TRIPLET CALVES born during 1946, were believed by their owner, R. P. Baker of Troy, N.Y., to be the only triplet calves produced by artificial insemination

strong demand for meat and milk kept the cattle industry from declining as the usual cycle would have done. The decline was practically halted in 1946. Cattle slaughter under federal inspection ran below 1945 during the first half of the year but jumped above the record of 1945 in July when price ceilings were removed, only to drop again when they were replaced. Then, when controls were removed again, the flow of cattle to market was resumed at a record rate. The livestock markets experienced successive floods and gluts of animals because of the changes in price control to a fantastic degree. At times the market receipts were at record low numbers to be followed by high record receipts.

Cattle prices rose steadily in 1946 to record levels in August after the lapse of price control. The top price for the best grades at Chicago rose to \$30.25 per 100 lb. while the average price of slaughter steers in Aug. 1946 was \$21.71 compared with \$17.30 in June. Meat prices reached records in retail markets but did not hold the high levels through the late months of the year because of consumer resistance against extremely high prices. The average price of live beef cattle of all classes to producers was \$18.10 per 100 lb. in October, \$17.60 in November and \$17.40 in December. Veal calves followed the same general trend.

Cattle feeding continued high in 1945 and on Jan. 1, 1946, there were estimated to be 4,157,000 cattle on feed or about 4% fewer than a year earlier. The number of cattle on feed in the corn belt was low up to Aug. 1. The high prices of meat during the year led to larger numbers being fed during the summer and fall of 1946. The July to September movement of stock and feeder cattle was 36% greater than a year earlier. Prices of feeder cattle were much higher in the fall of 1946 than a year earlier. The record feed crops also stimulated feeding as stockmen's profits were favourable during 1945-46. The supply of feed, even with record crops, was less than the market demand during the years 1944-46. All animals were fed to heavy weights.

Meat production continued high through 1946. Beef output reached a peak in 1945 and in 1946 declined to near the level of

1944 as did veal. Civilian consumption of beef was estimated at 58.7 lb. per capita in 1945 and about the same in 1946. The total of veal declined slightly. The large demand in the second half of 1946 was checked to some extent by the high prices. Government buying was ended Sept. 30, 1946, and the needs of the military forces continued to decline.

A new feature of the cattle business was the expansion of feeding operations by chain stores having slaughter facilities and by contract by meat packers. In these operations the packers operate feed lots or contract with farmers to feed cattle to their requirements. While the large number of cattle was moving to feed lots in September, the rate of slaughter declined and meat production reached a record low level, the smallest for any month after 1920 and only one-fourth of that of Sept. 1945. (See also LIVESTOCK.) (J. C. Ms.)

Cavan, Frederic Rudolph Lambart 10TH EARL OF (1865 - 1946), British army officer, was born on Oct. 16. He saw his first active military service in the South Africa war, 1901, and at the start of World War I had already been in retirement for one year. Recalled to active duty, he served in France and in 1918 assumed command of the British forces on the Italian front. In 1922, he became chief of the Imperial General staff and in 1926 retired. He was named Field Marshal in 1932. Soon after Munich, he met Mussolini in October of 1938, and the Italian dictator assured the Field Marshal that he "loved England." Holder of numerous foreign decorations, Lord Cavan removed the ribbon of an Italian order when that country entered the war against the Allies in 1940. He died in London on Aug. 28. See *Encyclopædia Britannica*.

Cement. The salient features of the cement industry in the United States during the years 1939-45 are indicated in the table.

After the peak of war construction had been passed late in 1942 there was a sharp drop in cement production, extending to early in 1945, when the approaching end of the war brought a renewal of building activity, causing an increase in cement output from 5,371,000 bbl. in February to 11,104,000 bbl. in October. After the seasonal decline during the winter months, production expanded rapidly, reaching 16,213,000 bbl. in Aug. 1946, a level 6% higher than the monthly average in 1942, the peak year in the war demand. Shipments were running well

ahead of production at 17,955,000 bbl. and stocks had been cut to 9,300,000 bbl. from 20,000,000 bbl. in February. Plants were operating at 79% of capacity, against an average of 42.5% in 1945 and 73.5% in 1942. This was only the first lap in a postwar building program that was expected to reach unprec-

edented proportions under the combined demand for home, commercial, industrial, municipal and government construction.

Cement sales in Canada followed the same general trend as in the U.S. Output declined from 7,302,289 bbl. in 1943 to 7,190,851 bbl. in 1944, and increased to 8,378,341 bbl. in 1945. Conditions continued to improve in 1946, with sales through July 51% ahead of the same period of 1945. (See also GYPSUM.) (G. A. Ro.)

Census Data, 1946. By way of supplement to the results of the periodic censuses, the bureau of the census collects a wide variety of data on a monthly, quarterly, or annual basis, publishes frequent estimates of population, labour force, employment and unemployment, and makes special censuses of limited areas and surveys in various fields from time to time, as occasion demands. A considerable part of the current data is based on sample inquiries and is, therefore, subject to a moderate sampling variation. With respect to these sample-based statistics it may be said that in general the totals and the larger subtotals in any given table are subject to a fairly small error from this source, but that the smaller and more detailed subtotals are subject to a possibility of error which increases with the decrease in the size of the figures in question.

Growth of Total Population.—Estimates of the population of the United States as a whole have been made month by month after the census of 1940, on the basis of current records of births and deaths (corrected for underregistration) and net immigration, the latter including the excess of arrivals over departures of citizens as well as aliens. The estimates for Jan. 1 and July 1 of each year from this series are presented in Table I. These estimates represent the *de jure* population, including persons in military service overseas. Table I also shows the increase in each six-month period and the various elements used in computing the estimate—namely, births, deaths and immigration from outside the U.S. The estimates are presented to the last digit as computed instead of being rounded, not because they are assumed to be accurate to the last digit but for convenience in summation.

The population of continental United States on July 1, 1946, according to these estimates, was 141,205,806, which represents an increase of 1,584,375 over the population estimated for July 1, 1945. The sources of this increase may be analyzed as follows: There were, during the year ending June 30, 1946, 2,895,144 births, from which may be subtracted 1,502,440 deaths, leaving a natural increase of 1,392,704, which represents the major part of the population increase. The remainder was made up of net civilian immigration amounting to 191,671. The rate of increase for the year ending in June 1946, was 1.1%, which is slightly less than the rate of increase attained in 1943 (1.4%) or 1944 (1.2%), but much higher than the average annual rate of 0.7% for the decade 1930-40. The maximum increase in any six-month period, it may be noted, was that in the second half of the year 1942, which amounted to 981,045, or 0.73%.

The acceleration in the rate of population growth results mainly from considerable increases in the annual number of births, for the most part following at an appropriate interval similar increases in the number of marriages. The contribution of immigration increased from less than 60,000 in the year ending June 30, 1941, to nearly 200,000 in 1945, but still formed only about 12% of the total increase.

During the year ending June 30, 1943, in which the birth rate reached the highest point in recent completed years, there were 3,209,177 births, as compared with 2,628,113 in the fiscal year 1941, and an annual average of about 2,400,000 for the

*Estimated total, including adjustment for underregistration.

†Preliminary figures.

decade between 1930 and 1940. Since 1943, the number of births recorded have been somewhat, though not very much, lower than in the record year, the lowest figure for a six-month period having been reached in the period from Jan. 1 to June 30, 1946. Preliminary figures for births as reported month by month during 1946, however, indicated a spectacular increase in the birth rate beginning with July. The provisional birth rate (based on registered births) for the first half of 1946 was 19.2 per 1,000 of the population, which was slightly lower than the corresponding rate for the first half of 1945. The rates for the months immediately following, however, indicated a much more rapid increase even than that which led up to the 1943 maximum. Computed on an equivalent annual basis, the provisional birth rate for July was 23.2; for August, 25.3; for September, 27.9; for October, 28.6, and for November, 26.8, or nearly 50% higher than the average for the first half of the year. It seems safe to assume that the number of births in December was approximately the same as in November, in which case the rate for the year 1946 would stand at slightly over 23.0, and the number of births (including allowance for underregistration) to be expected for the calendar year would be at least equal to the 1943 record; and the number to be expected in the entire fiscal year ending June 30, 1947, even with a moderate recession in the monthly rates, would far exceed the 1943 maximum.

While it is difficult to forecast even the immediate future under conditions of such rapid change as those obtaining at the end of 1946, it seems likely at this writing (Jan. 1947) that the high birth rates of the last few months of the present record may be maintained for a number of months. The most substantial basis for this assumption is found in the statistics for marriages, especially in the monthly figures for marriage licences issued as reported for cities of 100,000 or more. The maximum figure in this series, 86,448, was reported for June 1946, with another high figure, 74,640, for August, and 60,110 for November. These figures may be compared with a monthly average of 47,440 for the year 1945. (See *Marriage and Divorce* for further discussion of marriage statistics.) The rapid return of men from overseas military service, beginning in the latter part of 1945, is another factor whose effect was expected to continue through 1947 and perhaps longer.

Forecasts based on medium assumptions with respect to the factors affecting population increase indicated that the population of the United States in 1950 would be 145,460,000; in 1970, 159,847,000; and in 1990, 164,585,000, with a slight decrease to 163,312,000 in the year 2000. These computations were made in 1945 on the assumption that there would be very little increase in population through immigration. If immigration should remain at its 1946 level and, in particular, if the net annual addition from this source should increase materially, the forecast for 1970 would have to be increased by 4,000,000

or 5,000,000, with corresponding increases for later figures.

While those population estimates which include the military forces abroad are the most fundamental of all the estimates which the census bureau makes, especially for use in comparisons over fairly long periods, there are demands for estimates representing only the population actually in continental United States (sometimes referred to as the *de facto* population) or for the civilian population, excluding all persons in military service. Such estimates, together with figures representing the number of persons in military service, are presented in Table II.

A brief study of the columns representing the three types of estimates as presented in Table II will show that while the total population increased regularly period by period (mainly as a result of the excess of births over deaths) the civilian population in particular followed a radically different pattern, showing actual decreases in more than half of the six-month periods for which data are presented, and relatively small increases in most of the other periods except the two most recent.

CENSUS ENUMERATOR securing data from a housewife in London, Eng., during 1946. The family census, the first taken of British families after 1911, was a sample canvass of 1,600,000 families, one name being selected from every ten cards in the National Registration records

Table II.—*Estimates of the Population of the United States—Total, De Facto, Civilian and Military: 1940 to 1946*

(De facto population includes persons in military service in continental United States, but excludes those overseas)

Date	Total population	De facto population	Civilian population	Persons in military service
July 1, 1940	131,970,224	131,954,144	131,659,286	310,938
Jan. 1, 1941	132,637,933	132,560,843	131,896,959	740,974
July 1, 1941	133,202,873	133,060,045	131,557,730	1,645,143
Jan. 1, 1942	133,953,225	133,688,443	131,943,065	2,010,160
July 1, 1942	134,664,924	133,770,500	130,874,910	3,790,014
Jan. 1, 1943	135,645,969	134,041,664	128,727,843	6,918,126
July 1, 1943	136,497,049	133,966,319	127,410,357	9,086,692
Jan. 1, 1944	137,368,379	133,580,283	127,028,036	10,340,343
July 1, 1944	138,083,449	132,552,005	126,536,174	11,547,275
Jan. 1, 1945	138,922,634	131,663,972	127,037,289	11,885,345
July 1, 1945	139,621,431	131,975,774	127,409,297	12,212,134
Jan. 1, 1946	140,386,509	136,837,944	133,542,699	6,843,810
July 1, 1946	141,205,806	139,853,846	138,254,982	2,950,824

The reason for this situation lies of course in the fact that the number of persons entering military service during the war period exceeded the natural increase in the population. It was only with the demobilization of the armed services, following July 1, 1945, that the civilian population began to make marked increases. Somewhat similar relations are shown between the total population and the *de facto* population, the difference in this case representing the number of persons in military service overseas, rather than the total military personnel.

Births and Deaths.—As an indication of the general trend in the principal factors of population increase, namely, births and deaths, there is presented in Table III a summary of the birth rates and death rates for the years from 1920 to 1945. These rates are for calendar years, and are based on registered births, without adjustment for underregistration. Rates based on the adjusted figures would be slightly higher, but would show practically the same variation over a given period of time. The maximum birth rate, it may be noted, was recorded for the year 1921, a year shortly after the close of World War I. During the next dozen years there was an almost continuous and fairly rapid decline in the birth rate to a low point of 16.6 in 1933, which year may be regarded as the bottom of the depression. During the remainder of the decade of the 1930s there were slight changes upward and downward, the net effect of which was a rate of 17.9 in 1940. The higher levels which the birth rate attained in the early war years have already been discussed in connection with the matter of population increase. The death rates have shown, with some irregularities, a tendency to become lower, with no very definite cycles of change.

Table III.—*Birth Rates and Death Rates: 1920 to 1945*

(Based on registered births and deaths)					
Calendar year	Birth rate	Death rate	Calendar year	Birth rate	Death rate
1920	23.7	13.0	1933	16.6	10.7
1921	24.2	11.5	1934	17.2	11.1
1922	22.3	11.7	1935	16.9	10.9
1923	22.1	12.1	1936	16.7	11.6
1924	22.2	11.6	1937	17.1	11.3
1925	21.3	11.7	1938	17.6	10.6
1926	20.5	12.1	1939	17.3	10.6
1927	20.5	11.3	1940	17.9	10.7

1929	18.8	11.9	1942	20.9	10.4
1930	18.9	11.3	1943	21.5	10.9
1931	18.0	11.1	1944	20.2	10.6
1932	17.4	10.9	1945	19.6	10.6

Immigration.—The net civilian immigration figures (191,671 for the year ending June 30, 1946) referred to above as a factor in current population increase, represent the difference between much larger numbers of arrivals and departures, the total number of arrivals during the fiscal year 1946 amounting to 672,020, with 480,349 departures. These figures, classified into three groups, United States citizens, immigrant aliens and nonimmigrant aliens, are presented for the fiscal years 1944, 1945 and 1946 in Table IV. The figures in this table represent arrivals in, and departures from, continental United States, including

movement between the mainland and the various territories and possessions. In the immigration statistics as usually published by the immigration service the United States and its possessions are considered as one unit. The principal difference, however, between these "usual" figures and figures for the states alone, presented herewith, is in arrivals and departures of United States citizens, of whom there was a net movement of about 40,000 from the territories and possessions in 1946, mainly from Puerto Rico.

Table IV.—*Immigration: Arrivals and Departures of Citizens and Aliens: 1944, 1945 and 1946*

(Years ending June 30. Figures refer to continental United States and include arrivals from and departures for the territories and possessions)

ITEM	1946	1945	1944
Arrivals, total	672,020	421,004	287,967
United States citizens	360,567	219,446	147,516
Immigrant aliens	108,252	38,014	28,439
Nonimmigrant aliens	203,201	163,544	112,012
Departures, total	480,349	222,091	161,752
United States citizens	276,643	129,674	78,375
Emigrant aliens	18,155	7,396	5,653
Nonemigrant aliens	185,551	85,021	77,724
Excess of arrivals over departures, total	191,671	198,913	126,215
United States citizens	83,924	89,772	69,141
Immigrant aliens	90,097	30,618	22,786
Nonimmigrant aliens	17,650	78,523	34,288

By way of explanation of the difference between immigrant and nonimmigrant aliens, the following figures relating to immigration of aliens to the United States and its possessions during the fiscal year 1945 may be quoted. Of the 38,119 immigrant aliens, 11,623 were quota immigrants and the remainder nonquota immigrants, made up mainly of 22,770 natives of nonquota countries, such as Canada and Mexico, and 2,735 wives of United States citizens. Nonimmigrant aliens in that year numbered 164,247, the principal classes being temporary visitors for business, 76,747; temporary visitors for pleasure, 30,982; government officials, their families, etc., 18,054; and persons in continuous transit through the United States, 28,174.

Marriage and Divorce.—The number of marriages which took place in the United States in the years just following 1939 represented very material increases over the record of earlier years, as already noted above. The maximum year of completed record was 1942, in which year there were 1,772,000 marriages, as compared with 1,404,000 in 1939, with considerable decreases in 1943 and 1944, a substantial increase in 1945, and a new record of more than 2,000,000 marriages in 1946. These figures are summarized in Table V for the years 1937-46, with corresponding figures for divorces up to 1945. The increase in the number of divorces has been even more rapid than the increase in the number of marriages, the 1945 figure being exactly twice that of 1939. In 1945 there were 31 divorces for every 100 marriages.

Table V.—*Marriages in the United States: 1939 to 1946*

Calendar year	Number of marriages	Increase (+) or Decrease (—) From Preceding Year		Marriages per 1,000 of population	Number of divorces	Divorces per 100 marriages
		Number	Per cent			
1937	1,451,000	—	—	11.3	249,000	17.2
1938	1,331,000	—120,000	—8.3	10.3	244,000	18.3
1939	1,404,000	73,000	5.5	10.7	251,000	17.9
1940	1,596,000	192,000	13.7	12.1	264,000	16.5
1941	1,696,000	100,000	6.3	12.7	293,000	17.3
1942	1,772,000	76,000	4.5	13.2	321,000	18.1
1943	1,577,000	—195,000	—11.0	11.6	359,000	22.8
1944	1,452,000	—125,000	—7.9	10.5	400,000	27.5
1945	1,618,000	166,000	11.4	11.6	502,000	31.0
1946	2,175,000*	557,000	34.4	15.4

*Preliminary unofficial estimate based on percentage increase shown for cities of 100,000 or more.

Current figures on the number of marriages in cities of 100,000 inhabitants or more, which are available each month, form one of the most useful bases for short-range estimates of the probable trend of population. These figures are summarized in Table VI.

The most outstanding feature of Table VI is the marked in-

crease in the number of marriages which took place in the months subsequent to Oct. 1945. The population of the areas to which these figures relate represents about one-third of the population of the United States; and while changes in the number of marriages reported for these cities and the number compiled some months later for the United States as a whole were not by any means identical, there was in general a sufficiently close correspondence to make these figures a reliable index of the trend in the country-wide figures.

Table VI.—*Marriage Licences Issued in Cities of 100,000 Inhabitants or More, by Month: 1941 to 1946*

Internal Migration.—Migration within the United States, which was greatly stimulated by the war, continued at an accelerated pace during the first six months of peace. In addition to the returning veterans, that is, the men who were returning from military service to civilian life, there were in Feb. 1946, 5,100,000 nonveteran civilians who had lived in a different county on V-J day. Not many of these were wartime migrants returning to their prewar residence; most of them were either people who had not moved during the war or wartime migrants moving on to new places after V-J day. The present information on internal migration is based on the results of a survey made in Feb. 1946. In this survey each person in a representative sample of about 25,000 families was asked where he was living on April 1, 1940, the date of the last federal census, as well as on V-J day, Aug. 14, 1945. The answers to these questions provided information on migration over two periods; the six months following the close of hostilities, and the period of nearly six years after the 1940 census.

Over the longer interval, 1940-46, which includes the period of defense preparation and of U.S. participation in the war and a considerable part of the period of demobilization, 19,520,000 persons had changed their county of residence, as indicated in Table VII. These migrants made up 14.6% of the civilian population as constituted in Feb. 1946. The migrant figure includes 2,210,000 veterans, or nearly one-fourth of the estimated total of 9,380,000 veterans in the United States in Feb. 1946. In addition,

Table VII.—*Migration of the Civilian Population (a) April, 1940 to February 1946, and (b) August 1945 to February 1946*

(Data based on a small sample. Population in institutions not included)

Migration status and veteran status	Period of April 1940, to Feb. 1946 (5 yrs. 11 mos.)	Period of Aug. 1945 to Feb. 1946 (6 months)
	Feb. 1946	Feb. 1946
Total civilian population, February 1946 . . .	133,900,000	133,900,000
Nonmigrants	114,200,000	121,640,000
Migrants	19,520,000	8,110,000
Within a state	8,100,000	2,320,000
Between states	11,420,000	5,790,000
Persons abroad at beginning of period.	180,000	4,150,000
Male veterans, February 1946	9,380,000	9,380,000
Nonmigrants	7,080,000	2,330,000
Migrants	2,210,000	3,010,000
Within a State	820,000	260,000
Between States	1,390,000	2,750,000
Persons abroad at beginning of period.	90,000	4,040,000
Other civilians, February 1946	124,520,000	124,520,000
Nonmigrants	107,120,000	119,310,000
Migrants	17,310,000	5,100,000
Within a State	7,280,000	2,060,000
Between States	10,030,000	3,040,000
Persons abroad at beginning of period.	90,000	110,000

tion, there were 90,000 of these veterans who were abroad in 1940, while the remaining 7,080,000 had presumably returned to their home counties after discharge from military service. Around 5,000,000 persons were still in the armed forces and were not covered by the survey.

In addition to the 5,100,000 nonveteran civilians who had moved from one county to another in the six months between Aug. 1945 and Feb. 1946, there were 3,010,000 veterans of World War II who had migrated during this period. Most of these were in the armed forces on V-J day, but some had been discharged before that date. The total of 8,110,000 migrants in this six-month period does not include a further 4,150,000 persons who were outside the United States on V-J day (mostly in the armed forces) and had returned to the United States by the following February.

In the classification of migrants as between those who moved from one county to another within a state and those who moved from one state to another, it may be noted that more than 70% of the 1945-46 migrants were interstate migrants, as compared with less than 60% of the whole number of migrants shown for the period 1940-46—and with only a little more than 40% of the migrants between 1935 and 1940, as shown by the 1940 census.

This dominance of long-range movement might be accepted as characteristic of migration in the period of large-scale re-establishment of population after demobilization and industrial reconversion, aided possibly by a familiarity with easy long-distance movement resulting from wartime experience.

From the answers to the two questions carried in this migration survey it is possible to identify those persons who had moved away from their 1940 residence at some time between April 1940 and Aug. 1945, but had returned to it by Feb. 1946. Roughly, this might be considered a measure of the extent to which those who had left their normal place of residence for employment in war activities had returned to their original county of residence after the close of the war. The number of nonveteran civilians who had thus returned between V-J day and Feb. 1946, was only 1,200,000, which seems a small number in comparison with the 17,310,000 nonveteran civilians who in Feb. 1946, lived in a different county from that of their residence in April 1940. Evidently wartime migrants have not tended to go back to their prewar homes, but have chosen to settle down in their new residence, or else to move on to still another county.

Of the 9,380,000 male veterans in the United States in Feb. 1946, 7,080,000 or 75%, were living in the same county as in April 1940, though practically the same percentage had been elsewhere in the United States or abroad on V-J day. Of those who had been away from their home county on V-J day, 5,450,000 were back again in Feb. 1946—2,170,000 from other parts of the United States, and 3,280,000 from overseas. The data on return migration, both for veterans and for nonveteran civilians, are summarized in Table VIII.

Table VIII.—*Return Migration in the United States, 1940 to 1945 and 1945 to 1946*

(Data based on a small sample)

Migration History	Total return migrants	Male veterans	Other civilians
Migrants, 1945 to 1946, returning to county of 1940 residence	3,370,000	2,170,000	1,200,000
Migrants within a state	560,000	140,000	420,000
Migrants between states	2,810,000	2,030,000	780,000
Migrants, 1945 to 1946, returning to state, but not county, of 1940 residence	370,000	230,000	140,000
Persons returning from abroad, 1945 to 1946, who went abroad, 1940 to 1945	4,100,000	4,010,000	90,000
Returning to state of 1940 residence	3,630,000	3,570,000	60,000
Same county	3,330,000	3,280,000	50,000
Different county	300,000	290,000	10,000
Returning to different state	470,000	440,000	30,000

Marital Status.—A survey made in Feb. 1946 indicated that the wartime increase in the percentage of men and women who were married had continued up to that time. Since many men were still in the armed forces in Feb. 1946, the number of married women represented the best approximation to the number of married couples in the population of the United States. At that time there were estimated to be 33,810,000 married women, representing 63.2% of the female civilian noninstitutional population 14 years old and over. A similar survey made in Feb. 1944, showed 32,850,000 women married, or 62.8% of the basic population. In 1940 the decennial census showed as married only 30,090,488 women, or 59.5% of the total female population 14 years old and over. The percentage of women married had been increasing slightly after 1890, but the increase between 1940 and 1946 was equal to all of the increase in the 50-year period preceding 1940. The data on marital status for the civilian population in 1946 and 1944 and the total population in 1940 are summarized in Table IX.

Table IX.—Marital Status of the Civilian Population 14 Years Old and Over, February 1946 and 1944, and April 1940

(Data for 1946 and 1944 based on a small sample and exclusive of persons in institutions)

Sex and marital status	Civilian population, 1946	Civilian population, 1944	Total population, 1940	Per cent distribution		
				1946	1944	1940

Dec. 14	16,010,000	15,090,000	920,000	5.7

The extent to which the war necessitated the temporary separation of married couples is indicated by the figures for married women classified according to whether their husbands were present (that is, living in the same household) at the time of the survey. There were in Feb. 1944, 2,760,000 married women whose husbands were absent in the armed forces, this group representing 5.3% of the whole number of married women. By Feb. 1946 this number had been reduced, mainly by the return of husbands from military service, to 1,240,000 or 2.3%

of the total. The number of married women with husbands absent elsewhere than in the armed forces declined from 1,460,000 in 1944 to 1,150,000 in 1946. This may represent the return of husbands who had left their wives to seek employment in war activities, though even the figure quoted for 1944 is smaller than the number of married women with husbands absent in 1940, as returned in the decennial census.

Employment and Labour Force.—On the basis of data obtained each month from a representative sample of 25,000 or 30,000 households in the United States, monthly estimates have been published since March 1940, giving the number of persons in the civilian labour force, the number employed (with separate figures for those in agriculture and those in nonagricultural industries), and the number unemployed. These statistics are summarized for the year 1946, with comparable data for July and Oct. 1945, in Table X and the data for the labour force are shown in graphic form in the chart on page 189.

At least four important trends may be observed in the figures for the 18 months covered by Table X. First, the rapid increase in the civilian population 14 years old and over which followed close behind the demobilization of the military forces. The increase in the civilian population between July 1945, and Dec. 1946, amounted to 11,760,000, being the sum of the number of persons released from military service and the normal increase in the population 14 years old and over. Since the military separations were by far the more important factor, the increases recorded month by month naturally ran closely parallel with the numbers released from the services.

Second, the civilian labour force (the sum of the number of persons employed and the number seeking work) followed rather closely the course of the rapidly increasing civilian population, though the percentage of the population in the

labour force declined rather sharply from 59.3 in July 1945 to 55.9 in October and to 53.4 in Jan. 1946, rising again to 58.0 in July 1946, at the peak of the seasonal employment, and standing at 55.6 in December.

Except for the first three-month period, these declines in the percentage of the population in the labour force resulted from the fact that the additions to the labour force lagged somewhat behind the additions to the civilian population. There was an increase in the actual numbers in the labour force in each month in 1946 up to the seasonal maximum of 60,110,000 in July 1946. After the seasonal peak was passed, the civilian labour force seemed to have stabilized at around 59,000,000, with a further decline to 58,430,000 in December. Since the labour force is dominantly male, the changes observed in the figures for males alone follow closely the trends just noted in the totals. Relatively, however, the decline in the female labour force during the early postwar months was much sharper, the percentage of the female population in the labour force dropping from 37.9 in July 1945, to a low of 29.9 in Feb. 1946, then rising to 32.4 in July and declining from 32.0 in September to 30.4 in December.

Third, the number of civilians employed dropped from 54,400,000 in July 1945 to 51,610,000 in October and to 51,020,000 in Jan. 1946, in part because of unavoidable delays in the reconversion from war industries to the production of civilian goods. This trend was quickly reversed, however; the October total was exceeded in May, and a maximum of 57,840,000 was reached in July 1946, with employment maintained at a little over 57,000,000 from September to November, and a decline to 56,310,000 in December.

Fourth, unemployment increased, of course, during the early reconversion period, rising from 950,000 in July 1945, to 1,560,000 in October, and 2,300,000 in Jan. 1946, and to a maximum of 2,700,000 in March. It then declined to a little less than 2,000,000 in Oct. and Nov. (1946) and then increased to 2,120,000 in December. Even the maximum of 2,700,000, it may be noted, was only a small fraction of the unemployment which was forecast by many economists in the early months of 1945.

The changes in the numbers of unemployed took place for the most part among the male workers; the number of females seeking work held close to 400,000 or 500,000 throughout most of the period under consideration.

Because of the importance of the agricultural industry and the radically different conditions which obtain as between agriculture and most other industries, it is important to have a record of employment in these

Table XII.—Estimates of Employment Status of Male Veterans of World War II, November 1945 to November 1946

(Totals based on data from the war and navy departments. All numbers in thousands)

Week ending	Total male veterans of World War II	In civilian labour force			Not in labour force		
		Total	Employed	Unemployed	Total	In school	Other
1945:							
Nov. 10	5,600	3,830	3,310	520	1,770	170	1,600
Dec. 8	7,020	4,990	4,240	750	2,030	230	1,800
1946:							
Jan. 12	8,580	6,410	5,570	840	2,170	290	1,880
Feb. 9	9,600	7,440	6,380	1,060	2,160	420	1,740
March 9	10,410	8,410	7,200	1,210	2,000	540	1,460
April 13	11,080	9,240	8,250	990	1,840	540	1,300
May 11	11,520	9,830	8,900	930	1,690	570	1,120
June 8	11,890	10,380	9,400	980	1,510	480	1,030
July 13	12,280	10,810	9,880	930	1,470	460	1,010
Aug. 10	12,580	10,950	10,100	850	1,630	480	1,150
Sept. 14	12,790	11,230	10,400	830	1,560	760	800
Oct. 12	12,810	11,150	10,390	760	1,660	1,160	500
Nov. 9	13,030	11,380	10,680	700	1,650	1,100	550
Dec. 14	13,160	11,450	10,610	840	1,710	1,110	600

two subdivisions of the industrial field. Data for civilian employment in agriculture and in nonagricultural industries are summarized, by quarters, from midyear in 1945 to the end of 1946 in Table XI.

The rather wide seasonal variation between July and January or February is one characteristic of agricultural employment, as compared with employment in the other industries, which showed a fairly steady increase from Oct. 1945 to Oct. 1946—aided, of course, by the increase in the total labour force—and even showed a slight increase in December, in spite of the decrease in total employment.

On the basis of the sample survey from which were derived the figures discussed above, estimates of the employment status of all veterans of World War II were made. These estimates for the months from Nov. 1945 to Dec. 1946 are presented in Table XII. Considerable numbers of men were separated from the military forces during the course of the war, so that the number of veterans at the beginning of the period covered by these estimates materially exceeded the number of recent discharges, and the number at the end of the period exceeded the maximum strength of the armed forces, even though around 2,000,000 men were still in the service.

The rapid increases in the number of unemployed veterans during the four months just preceding March 1946, reflects the rapidity with which service men were becoming ex-service men; and the increases in the number unemployed (from 520,000 in Nov. 1945 to 1,210,000 in March 1946) might well have been the result of throwing such large numbers of new candidates for jobs on a job market which was not growing quite fast enough to absorb them. From April to Nov. 1946, the number of unemployed veterans continued to decrease steadily, standing at 700,000 in November, but rising to 840,000 in December. The considerable numbers of veterans neither working nor seeking work were explained at first as made up primarily of veterans who were resting after their military activities or who had not yet entered the labour force for various personal reasons, and of those who were unable to work. By Oct. 1946 the number of veterans in school had reached a total of more than 1,000,000, and the number neither in school nor in the labour force had declined to 500,000.

Centennials: see CALENDAR, 1947, page xxii.

Central America. That section of the Americas situated between Mexico on the north and Colombia on the south. Six republics are located in the area: Guatemala, El Salvador, Honduras, Nicaragua, Costa Rica and Panamá; in addition it includes the colony of British Honduras and the Panama Canal Zone. Area: approximately 222,675 sq. mi.; pop.: about 9,088,000. Most of the inhabitants live in the temperate highlands of the southern cordillera.

History.—The political situation in Central America during 1946 was relatively quiet. Popular demonstrations against the administrations occurred, in the forms of mass meetings and strikes, but there were no major armed revolts, and no government was overthrown. Costa Rica, traditionally the most peaceful of the republics, experienced the most violence, two armed risings being thwarted in their inception by the government. In El Salvador popular demonstrations forced the Castañeda Castro administration to shuffle its cabinet three times during the year.

The last of the region's long-term military dictatorships

CIVILIAN EMPLOYMENT and unemployment, July 1945–Dec. 1946 (Source: U.S. Bureau of the Census)

—those of Gen. Tiburcio Carias Andino in Honduras and Gen. Anastasio Somoza in Nicaragua—showed signs of yielding to popular internal and official external pressure during the year, as both promised free presidential elections in 1947.

Three former presidents died during the year, and two more reappeared on the political scene. Gen. Jorge Ubico, of Guatemala (pres. from 1931–44), died in exile at New Orleans, La., in June; León Cortes Castro, of Costa Rica (1936–40), in his own country in March; and Dr. Juan Bautista Sacasa, of Nicaragua (1933–36), in exile at Los Angeles, Calif., in August. In May, Gen. Emiliano Chamorro, pres. of Nicaragua from 1916–20, returned from ten years in exile to assume the leadership of the Conservative party in his country. In July, Arnulfo Arias, pres. of Panamá from 1940–41, was released from prison and almost simultaneously put forward by his party as a candidate for the presidency in 1948.

In foreign affairs, Guatemala re-asserted sovereignty over the territory of British Honduras, but came to an agreement with Great Britain to submit the dispute to the judgment of the United Nations' court of international justice. Renewed efforts to revive the defunct union of Central American states included a meeting of the Unionist party's council in January, a conference of presidents in September (attended only by the chief executives of El Salvador and Guatemala) and a joint session of special commissions in December, all held in the republic of El Salvador. However, only Guatemala and El Salvador displayed active interest. An agreement in May between these two republics for the elimination of passport requirements respecting each other's nationals was subscribed to in September by Costa Rica, but plans to establish a customs union and to consolidate the consular services of Central America did not materialize. The commissions meeting in December were encharged with investigating the political and economic barriers to refederation and with drawing up recommendations of union for the consideration of the several states by March 1947.

Trade and Communication.—Foreign trade fell off in volume during 1946 in spite of increased shipping facilities, owing to shortages abroad of vital import items and reduced local production of the leading export commodities. Banana shipments suffered from labour strikes and wind damage to crops; the coffee yield was hurt by untimely rains; and gold and silver production was adversely affected by shortages of mining machinery. The general economic inflation was featured by rising living costs, budgetary deficits and shortages of goods, but currency values remained firm in relation to the U.S. dollar.

Central America's portion of the Pan-American highway was reported in April as being passable in all weather more than 3,200 mi. from Mexico to the Canal Zone, except for stretches of about 214 mi. in Costa Rica and 35 mi. in Panamá. A 200-mi. section between the canal and the Colombia border was still unsurveyed jungle. (See articles on individual countries.)

Ceylon. A British crown colony, lying off the southern extremity of India and approaching within 6° of the equator. Area: 25,332 sq.mi.; pop. (March 1946): 6,650,825. Chief towns (pop. census 1931): Colombo (cap., 284,155); Jaffna (45,708); Galle (34,424); Kandy (37,147). Languages: English, Sinhalese, Tamil; religion: chiefly Hinduism and Buddhism.

Governor for 1946: Sir H. Monck-Mason Moore.

History.—Demobilization and the change-over to peace-time industry began in Ceylon after the last meeting of the War council on Dec. 17, 1945. In spite of the shortage of transport, war prosperity had led to a rise in wages, full employment and better living conditions. A phenomenal rise in revenue, however, was followed by a rise in prices. Labour troubles led to short-lived strikes, which were promptly dealt with. The food problem at one time appeared serious, but was eased by the successful visits of the food commissioner to England and Australia.

The recommendations of the Soulbury commission, which gave the island responsible government of the parliamentary type, had been endorsed by Whitehall on Nov. 1, 1945, as "the foundation for a future dominion of Ceylon." It failed, however, to meet with the approval of the Tamils, who feared that a constitution based on the western democratic principle of majority rule would place the minorities in a state of permanent subjection.

The introduction of democratic institutions synchronized with sweeping educational changes. Ceylon now had its own autonomous university, where special attention was paid to oriental studies. Free education from the kindergarten to the university was introduced. A highly significant move was the adoption of the mother-tongues, Sinhalese and Tamil, in place of English as the medium of instruction. A similar change was proposed for the law courts. The general prosperity of Ceylon was reflected in the increase of the population by 25% from 1930.
(H. G. RN.)

Education.—Sinhalese and Tamil schools 4,135; scholars, male 374,277, female 292,634; English and bilingual schools 416; scholars, male 66,467, female 34,756; University of Ceylon (1945), students 1,065.

Banking and Finance.—Revenue (est. 1946–47) £25,650,000; expenditure (est. 1946–47) £25,585,333; public debt (Sept. 1944) £22,095,770. Rate of exchange (1946): One rupee (100 cents)=1s. 6d. or 30.16 U.S. cents.

Trade and Communication.—Overseas trade (merchandise, 1945): imports £44,276,870; exports (domestic) £44,354,980; re-exports £5,291,000. Communication and transport: roads for motor traffic (1943) 6,551 mi.; railways (1944) 912 mi. (including 106 mi. narrow gauge); shipping entered (1942) 2,724,000 net tons; motor vehicles licensed (Dec. 31, 1941):

USING ELEPHANT POWER to topple a coco-nut palm in making a clearing near Colombo, Ceylon, in 1946

20,092 motor cars and taxis; 4,394 trucks and vans; 2,486 omnibuses; 2,644 cycles; 66 tractors; 231 trailers; wireless receiving set licences (Dec. 31, 1940) 9,736; telephone instruments in use (1938) 10,424.

Agriculture.—Production in short tons (1945): rice (yearly average) 209,200; rubber 111,552. Value of exports (1944): tea £23,324,130; copra £2,139,300; coconut oil £1,211,200.

Chambers of Commerce. The year 1946 was one of growth and progress for the Chamber of Commerce of the United States, in its capacity as a major representative of business. The chamber's membership grew to a total of 2,500 member business organizations with an underlying membership of their own of 1,083,000 firms, corporations and individuals.

Labour-management difficulties were of major concern during the year. The chamber worked to formulate an employer-employee policy to increase understanding and co-operation between the two. Stabilization of public and private monies, international finance and renegotiation and cancellation of war contracts also loomed large in the chamber's work. As building controls were relaxed, housing problems were echoed by civic planning needs. Conversion of the nation's transportation and communication systems to peacetime operations and their improvement to meet future needs, were carefully studied.

During the year, the chamber maintained close touch with congressional and administrative activities. It interpreted to government the needs of business, and, in turn, served business and the public as an informant on national and international affairs. The chamber advocated the loan to Great Britain, universal military training, improved educational facilities for the nation's youth, civilian control of atomic research and elimination of world trade barriers. Finally, the national chamber issued a broad and effective report on communistic activities in the U.S..

In May 1946, William K. Jackson of Boston, Mass., was elected president of the Chamber of Commerce of the United States; Ralph Bradford continued as general manager.

(W. K. J.)

Junior Chambers of Commerce.—More than 150,000 junior chambers of commerce members (known as "Jaycees") in the United States and Canada swung into action during 1946 to fight for better communities and cleaner government, international friendship and understanding.

On a community level, more than 1,200 local organizations worked to establish municipal airports and to combat juvenile delinquency with sports programs, a Jaycee baseball league for boys (under 16 years of age) and teen-age canteens. They led clean-up campaigns in community face-lifting projects and fought tuberculosis and syphilis by sponsoring city-wide X-rays and blood tests. They laboured on year-around safety campaigns to reduce traffic fatalities. Veterans' affairs were of prime importance, and in Detroit Jaycees canvassed every building in the city to find housing for ex-service people. Every six weeks, information on national problems and an enclosed referendum to sample membership opinion were sent to each U.S. local group. Jaycees everywhere strove to bring political issues to the people in bipartisan public forums and get-out-the-vote activities.

U.S. Junior Chamber men voted at their annual convention to support the United Nations and the United Nations Relief and Rehabilitation administration. They urged the U.N. charter be amended to form a constitution for a federal world government of the peoples of the world with a bill of rights to protect them.

By 1946 the Junior Chamber of Commerce idea of learning leadership by organized effort in projects of community and

national improvement had spread to 30 nations. In February of that year the U.S. Junior Chamber joined with delegates from 18 nations to establish Junior Chamber International with headquarters in Panamá City, Panamá. International president was Erasmo Chambonnet, Colon, C.Z., and secretary was Hildebrando Nicosia, Panamá City.

Headquarters of the U.S. Junior Chamber of Commerce was the La Salle hotel, Chicago, Ill. Its principal officers were: president, Selden F. Waldo; executive vice-president, Rex McMorris; treasurer, William O. Kurtz, Jr. (S. F. W.)

Great Britain.—At its 86th annual meeting in April 1946 the Association of British Chambers of Commerce recorded its opinions on a number of national and international trade questions. The U.S. proposals for discussion at the international conference on trade and employment, to be held in 1947, were criticized on the grounds that lack of discrimination in international trading was unfair to those nations which were obliged to import on a large scale. In its report on the British proposals the association maintained that the commonwealth, colonies and dependencies were as much entitled to be regarded as a single economic unit as were the states of the U.S.A. and of the U.S.S.R. In any proposals that imperial preference should be abandoned, the association considered that undertakings not to increase margins of preference and not to introduce new preferences should not be entered into unless a similar undertaking were obtained that tariffs reduced as a *quid pro quo* for the elimination of preferences should not again be increased, and that no new ones should be imposed.

During the year the association made representations to the chancellor of the exchequer urging a reduction in direct taxation, even if the national account should be unbalanced as a result. At the annual meeting in April it put forward the opinion that taxation defeated its own object of raising revenue if it took a form which deprived either worker or employer of the incentive afforded by a fair reward for labour. The bill to amend company law was carefully watched by the association and efforts were being made to secure agreements with other countries with regard to double taxation. The government's nationalization policy caused much concern and three reports, *Nationalization or Private Enterprise*, *Nationalization of Transport* and *Nationalization of the Gas and Electricity Industries*, were put out by the association, supporting freedom of enterprise and urging a pause in the enactment of legislation involving further nationalization and control. (R. B. Dy.)

Channel Islands: see BRITISH EMPIRE.

Charles (CHARLES THÉODORE HENRI ANTOINE MEINRAD DE SAXE-COBURG, COUNT OF FLANDERS) (1903—), prince of Belgium, was born in Brussels, Oct. 10, younger brother of King Leopold III of the Belgians. On Sept. 20, 1944, shortly after the liberation of Belgium from German occupation, Prince Charles was appointed regent by a joint vote of the parliamentary chambers, as the king was still a prisoner of the enemy. On May 8, 1945, King Leopold was freed by Allied troops at Salzburg and four days later he confirmed the choice of the parliament, asking his brother to "continue the mission he had assumed in the interest of the nation." Considering the acuteness of the "royal question" (see BELGIUM), the prince regent deliberately avoided taking an active part in Belgium's political life. He was not often seen in public and officially his role was limited to helping in the formation of successive governments. Prince Charles visited England at the end of Jan. 1946; in May he spent a fortnight in Portugal and in mid-October he stayed three days in Paris. No reasons were given for these visits. (G-H. D.)

Cheese.

The production of cheese in the United States in 1946 amounted to a total of 1,050,000,000 lb. compared with 1,115,000,000 lb. in 1945 and 669,000,000 lb. in the 5-year average 1935-39. Only about one-third as much cheese was exported in 1946 as in 1945 and the military needs declined to about 15,000,000 lb. Stocks of cheese in storage increased during the midyear to exceed the prewar level but did not equal the volume of 1945. The price of cheese advanced following the end of the Office of Price administration ceilings and reached new high levels in August but the demand slackened by October and Wisconsin cheddars were sold at about 46 cents per pound. The rate of civilian consumption increased as the meat shortage continued and reached about 6.8 lb. per capita. The development of new varieties of cheese encouraged the use of this food to a marked extent so that all the increased output was expected to be consumed at sustained prices. (See also BUTTER; DAIRYING; MILK.) (J. C. Ms.)

Chemical Therapy: see CHEMOTHERAPY.

Chemistry.

In terms of chemical publication, 1946 reflected the war years. A considerable volume of research, which had been performed for military reasons, was released during the year. Interesting and valuable as much of such research may be, 1946 still cannot compare with an average prewar year in terms of broad, fundamental advance in chemical knowledge. Many scientists, however, returned to basic problems. This was expected to be reflected in the chemical journals for 1947. Nevertheless, for an indefinite period, the level of research activity for military purposes would probably remain far above that of prewar times.

Where once a large fraction of chemical publications appeared in German, only the Swiss ones remained in 1946. Apparently, however, the Allied military governments were taking the first steps towards permitting some resumption of German scientific activity and publication. The situation was not clear because of the lack of co-ordination among the four zones of occupation.

French chemists exhibited a noteworthy recovery from war conditions. The level of publication in French was unusually high. In that language, in Russian and in English, nearly all the research of any consequence in 1946 was published.

Nobel Prize. (See PRIZES OF 1946: *Nobel Prizes*.)

Americium and Curium.—By tradition, the discoverer of a new element may name it. The existence of elements of atomic numbers 95 and 96 had been announced in 1945, but their discoverer, Glenn T. Seaborg, announced their names in 1946. Number 95 was called americium, symbol Am; number 96 was called curium, symbol Cm.

The atomic number represents the positive charge on the nucleus of the atom and consequently the number of electrons arranged with the nucleus to make a neutral atom. These electrons are arranged in shells of which the innermost, *K*, may hold but 2 electrons; *L*, the next, 8; *M*, 18; *N*, 32; *O*, 50; etc. In the first rare earth, lanthanum (at. no. 59) shells *K*, *L*, and *M* are filled, shell *N* contains 18 electrons, shell *O*, 9, and *P*, 2. Eight electrons constitutes a shell of particular stability. Consequently, lanthanum will rather readily lose the two *P* electrons and one *O* electron. It forms the ion, La^{+++} , and trivalent compounds. Element number 60 has one extra positive charge on the nucleus and, consequently, one more electron. This electron is found in shell *N*. In following elements, shell *N* is filled. These elements are all much alike since their chemistry is largely determined by the three outermost electrons common to all of them, though a few also exhibit other valencies.

Seaborg proposed that a similar series begins with element 89 (actinium). The electron assignment in the transuranium elements has not yet been released, and some scientists were known to disagree with this view. The elements immediately beyond actinium do not exhibit a very stable trivalent state, but by americium the trivalent state is the most important one.

Cunningham obtained a weighable quantity of pure americium hydroxide, $\text{Am}(\text{OH})_3$. No pure curium compound had been prepared up to the close of the year; its chemistry was known only from tracer studies.

Americium and curium constitute the seventh and eighth members in the newly characterized "actinide" series. The elements in the analogous position in the rare earth series are europium and gadolinium. Johann Gadolin was an early 19th century pioneer in the study of rare earths. It was by analogy with these elements that 95 and 96 were named, curium being named after Madame Curie, the discoverer of radium.

Further details of the chemistry of the transuranium elements were released during 1946. When it became evident that plu-

A SINGLE CRYSTAL SPHERE of copper showing interference patterns of oxide film resulting from heating in air. This was an important development in the study of metals in 1946

tonium (at. no. 94, mass 239) would be superior to uranium 235 (at. no. 92, mass 235) as a fissionable isotope for an atomic bomb, it was necessary to design a plant for the separation and purification of the plutonium produced in the uranium pile. The procedure was entirely worked out by experiments upon a total of but 1/1000 of a gram of plutonium. Means of working on a microgram (0.000001 gram) scale were developed. From this information, the

plutonium producing plant at Hanford, Wash., was built. It worked successfully from the start; no formal pilot plant was built and the scale up from the original data was by a factor of 10^{10} . A number of pure compounds of plutonium were made as well as the metal. Solubilities and reactions were determined.

The preparation of pure neptunium (at. no. 93) was also announced. The isotope employed was not the short-lived predecessor of Pu^{239} , but a by-product of the uranium pile, Np^{237} , which has a half life of more than 2,000,000 years. This isotope, like Pu^{239} is fissionable; upon absorption of a neutron, it explodes into several fragments.

Details of the formation of americium and curium were released. The reactions are:

Here, *n* is the symbol for a neutron, the particle of mass 1 and charge 0; *e* is the symbol of the electron. $\text{}^2_2\text{He}^4$ represents the nucleus of the helium atom, the alpha-particle. The subscript at the lower left gives the atomic number of the isotope; the superscript, its atomic weight.

Isotopes as Tracers.—Incident to the operation of the uranium pile, radioactive isotopes of a number of elements are formed. Many elements not resulting directly from this process may be synthesized by placing suitable elements (or their compounds) within an operating pile to utilize its high level of neutron activity, since neutrons act on a number of nuclei to synthesize radioactive ones.

Synthetic radioactive isotopes were used in the years just before the war as tracers to study animal metabolism and to determine mechanisms of chemical reactions. The availability of such radioactive material from the Manhattan district and from the new British pile at Harwell, England, should greatly stimulate such work. The radioactive carbon isotope, C^{14} , will

be of particular interest in organic chemistry.

During the year it was announced that the Houdry corporation of Philadelphia was separating C^{13} from natural carbon, which is mostly C^{12} , by thermal diffusion columns. It was also being produced by the Eastman Kodak Company by a chemical exchange process. C^{13} may also be used as a tracer. Its course is followed by methods involving mass determinations of products.

Amino Acids.—No satisfactory method of analyzing mixtures of amino acids existed in the past. Since proteins are built from the 30 or so naturally occurring amino acids, this is a matter of great interest. The technique of microbiological assay as developed by Esmond E. Snell was extended to amino acids. A symposium at the September meeting of the American Chemical society was devoted to this.

Like man, bacteria have specific nutritional requirements. The growth requirements of certain lactic acid bacteria had been worked out in regard to vitamins permitting methods of assay of vitamins to be developed. The amino acids required for growth of these bacteria have been determined. A broth is provided which contains sugar, salts, vitamins and all but one of the necessary amino acids. If a material to be analyzed for this amino acid is added and the broth inoculated, the rate of growth of the bacteria is quantitatively a function of the amount of the amino acid present. This provides a rapid, reliable assay.

Acetylene.—The extensive German development of syntheses based on acetylene was revealed by British-American investigating teams. In large part, the acetylene was hydrogenated to ethylene for the manufacture of glycol, $C_2H_4(OH)_2$, and its derivatives, ethylene dichloride, $C_2H_4Cl_2$, and styrene, $C_6H_5CH=CH_2$, for synthetic rubber. Such processes are of no interest where petroleum is available since refining operations yield much ethylene as a by-product.

More significant are the developments of W. Reppe and his group at the I. G. Farbenindustrie. These resulted largely from their finding how to handle acetylene at temperatures up to $200^\circ C$. and at pressures up to 20 atmospheres without explosion, the danger of which had hindered previous exploitation. This was largely accomplished by dilution with an inert gas such as nitrogen.

Syntheses were of two types:

Thus, in one case, vinyl derivatives, $CH_2=CH-$, result; in the other, derivatives of acetylene, $-C \equiv C-$. In (a), potassium alkoxide is the catalyst. The vinyl ethers upon polymerization yield adhesives and coating materials, which had been made only in Germany. With other catalysts, other molecules can be added:

In type (b), copper or silver acetylide serves as catalyst. The product was converted to butadiene for synthetic rubber:

Instead of formaldehyde, ketones can be added to yield unsaturated alcohols or diols; amines give aminobutynes. These can be hydrogenated or chlorinated to give a variety of products.

A reaction combining types (a) and (b) gives acrylic acid and its derivatives which are important sources of certain plastics. $Ni(CO)_4$ is the catalyst.

Substitution of alcohol for water gives the ester.

High Polymers.—The production of polyisocyanates, a German development of the latter part of the war, aroused consid-

erable interest in the plastics industry after it was revealed by Allied investigating teams. The formation of a new family of plastic materials constitutes one of the most important German discoveries of the war years. An isocyanate reacts at a relatively low temperature with a free hydroxyl group to form an amide:

A di-isocyanate such as hexamethylene di-isocyanate (Desmodur H):

will react with a molecule containing two hydroxyl groups such as glycol, $HO-CH_2-CH_2-OH$, to form long chain molecules. Such chains are characteristic of plastics which soften on heating. Upon using a tri-isocyanate, the chains are cross-linked and polymers which do not soften on heating result. The isocyanates will react with the free hydroxyl groups of cellulose and its derivatives to yield products of decreased solubility and increased temperature resistance. They were applied to the tanning of leather and to the improvement of drying characteristics of glyptal resin compositions. The manufacture of these materials outside of Germany was under way at the end of the year.

Oxidation.—In the 1920s and 1930s much was learned about the nature of reactions involving transfer of an atom or group; much less was known about that of reactions involving electron transfer, that is, oxidation reactions. A symposium held by the Faraday society at the University of London led to the disclosure of much important work in this field.

The suggestion of L. Michaelis that two electrons cannot be exchanged in a single step (*i.e.*, oxidation of organic compounds proceeds in more than one step) received further support and was extended to inorganic oxidation-reduction reactions.

The reduction activation technique of polymerization developed in the laboratories of Imperial Chemical Industries was disclosed at this meeting. Oxidizing materials such as peroxides and persulfates have long been known to catalyze polymerization reactions. It has been held that free radicals initiate polymerization chains perhaps in this manner:

The product of this reaction is a free radical which can add to the monomer in the same way. Repetition of this process produces a chain polymer of many units from one initiating-free radical.

In the I.C.I. process, a reducing agent is added to the mixture of polymer and, say, persulfate. A wide variety of salts, inorganic compounds and organic compounds may serve as reducing agents. Presumably, high concentrations of intermediate products of the oxidation process serve as polymerization initiators. If hydrogen peroxide is the oxidizing agent and Fe^{++} the reducing agent, the active intermediate is believed to be the hydroxyl radical and to arise thus:

Adsorption Analysis.—Chromatographic analysis was extended in an important manner by Arne Tiselius and Stig Claesson at Uppsala (Sweden). As the name suggests, chromatographic analysis originally was applied to coloured compounds, a solution of which was passed through a column of adsorbent. All solute was adsorbed at the top. Upon further passage of a solvent, the less strongly adsorbed solutes were carried down the column and the components were found in successive bands identifiable by colour. By appropriately segmenting the adsorbent, pure compounds were recoverable. It was later found that on continued passage of a solvent, each component successively appeared in the effluent. This is called elution analysis. With uncoloured compounds special methods of analysis had to be applied and each successive batch of eluent had to be analyzed.

Tiselius and Claesson placed a small cell immediately below

the adsorbent to allow continuous observation and recording, if desired, of the refractive index of the solution. Elution analysis may thus be carried out far more conveniently and accurately. They also developed a technique in which the unknown is absorbed in the column and then displaced by a solution of a very strongly absorbed substance. Upon plotting change in refractive index against volume passed, a curve of ascending steps is obtained. The height of the level part of a step is characteristic of a particular compound, its length, of the quantity present.

The method was applied successfully to amino acids, homologous series of organic acids, and a number of other difficult mixtures. It should become a widely used tool in organic chemistry.

The technique has also been applied to gases and vapours. The refractive index cell is replaced by one in which the heat loss from a hot wire is measured. Of course, any physical property may be used to follow adsorption analysis but the two described above are convenient and general.

Antimalarial Compounds.—During World War II a vast volume of work was performed in England and in the United States, in quest of better antimalarials. Results of these investigations appeared in 1946.

Before the war, two German drugs had been advanced as antimalarials, atabrin and plasmochin.

Both of these compounds are derived from quinoline,

Nearly 10,000 new chemical compounds were prepared throughout the world in this investigation. Most of these were quinoline derivatives. Knowledge of its chemistry was thus greatly extended. Several effective drugs came out of the program, in particular SN 7618 and SN 13276 (index numbers of the Survey of Antimalarial Drugs which tested more than 15,000 compounds). SN 7618 was in commercial production and was especially effective in treating the deadly *vivax* malaria. SN 13276 was not fully tested but appears even more promising.

(R is the same as in atabrin)

The resemblance of SN 7618 to atabrin and of SN 13276 to plasmochin will be noted.

Sweetening Agents.—P. E. Verkade announced the discovery and commercial exploitation in Holland of a new sweetening agent about 4,000 times as sweet as cane sugar and about 10 times as sweet as saccharin. The compound and two similar ones with the ratios of their sweetnesses to that of sugar are:

Properties of Faces of Single Crystals of Metals.—Since an ordinary piece of metal is composed of microscopic crystals arranged helter-skelter, its surface is a mosaic of all possible faces of the component crystals and properties of the surface are averages of those of different faces.

Allan T. Gwathmey, at the University of Virginia, developed means of growing large single crystals and undertook systematic investigation of a number of properties of single, "pure," faces. Large single crystals of metals had been made before but Gwathmey's systematic investigation was without precedent. Most properties determined formerly on composite surfaces would have to be restudied on single faces.

In a single crystal, metal atoms are arranged in a highly ordered manner something like a three-dimensional chess-board. Place an atom of iron at each of the eight corners of a cube and one at its centre. Extend this pattern in all directions by adding more atoms. A *body-centred cubic lattice* results, in which each component cube is parallel to every other. Each atom at the vertex of a cube is shared by the seven other cubes meeting at this point. This is the ordinary form of iron.

If this crystal is cut along a plane parallel to a face of a component cube, the *cube face* of an iron crystal results. In this, the atoms are arranged exactly as the squares on a chess-board. But if the crystal is cut at an angle of 45° to the cube faces and such that the cut passes through parallel and diagonally opposite edges of component cubes, a different face results. It is constituted by parallel rows of atoms, as before, but alternate rows are staggered, and, per square cm. of face, there are 1.414 times as many atoms. Gwathmey found such faces to react at different rates with oxygen and other reagents, to exhibit different catalytic properties, and different capacities for adsorption of gases, to wear differently, etc. Furthermore, other and different angles of cutting will produce still other crystal faces, all of different properties.

One of Gwathmey's methods of producing single crystals involves slowly lowering a cylindrical crucible with a conical bottom from a furnace. A single-seed crystal forms at the point of the cone where the temperature first falls to the freezing point of the metal. This grows to fill the crucible.

One end of this is machined to a sphere. On its surface all possible faces must appear. Upon heating in oxygen, oxide is formed at different rates on different faces. On copper, the fastest rate is five times the slowest. This effect is made visible by beautiful coloured patterns of interference colours resulting from thin films of oxide. (See the photograph of a single copper sphere on p. 192.) The orientation of the crystal may be determined from the fact that six-cube faces (corresponding to the six-faces of the elementary cube) must exist. Knowing the orientation, larger quantities of any given face may be sliced from the crystal. Catalytic properties may, thus, be studied. In the combination of hydrogen and oxygen to water, there is one copper face of twice the catalytic activity of another. Among the properties studied are: adsorption, oxidation, corrosion, wetting, catalytic activity, electrode potential, susceptibility to

electrodeposition, wear, and coefficient of friction.

Penicillin.—In consequence of several years of effort in U. S. and British laboratories, penicillin was synthesized by purely chemical methods. The synthesis of benzyl-penicillin (penicillin-G) in small quantities was announced by V. du Vigneaud and co-workers at Cornell. It was not known up to the close of the year whether the reaction can be developed to compete with the mould fermentation method. Apparently the mechanism of the synthesis is obscure so that, unfortunately, no light was thrown on the structure of penicillin. However, the structure was confirmed by X-ray analysis.

Commercial production of crystalline sodium penicillin was announced. The only form available previously was the amorphous. The crystalline form is much more stable. For example, the time required for 15% loss in potency was found to be 0.5 day for the amorphous form and 28 days for the crystalline. (See also ATOMIC ENERGY; BIOCHEMISTRY; PHYSICS; VITAMINS.)

BIBLIOGRAPHY.—*Chemical Abstracts* (1945); *Chemical and Engineering News* (1945); *Nature* (1945). (R. L. B.)

Chemotherapy. Penicillin, as it had been made available commercially until early in 1946, was shown to consist of a mixture of four or more closely related chemical compounds, namely penicillins F, G, K and X. Several groups which had been studying the efficacy of penicillin in the treatment of syphilis found that the results appeared to be better when penicillin made subsequent to that time was employed. Investigation revealed that the introduction of new types of penicillium mould in the manufacturing process resulted in the production of a mixture of penicillins containing a high proportion of one known as penicillin K. The K type of penicillin was found to be highly active against bacteria in the test tube, but in the human or animal body, it was altered, destroyed or excreted so rapidly that the infecting germs were not exposed to sufficient penicillin to kill them. This situation was quickly corrected by appropriate changes in the manufacturing process and all of the penicillin available in the latter half of 1946 contained more than 75% of penicillin G, the kind known to be effective in the body.

Crystalline penicillin G became available commercially, simplifying transportation and storage of the drug because it is more stable than the impure forms. Various dosage forms for special uses were developed and marketed, such as tablets, troches, ointments and dental preparations.

Further experience in the treatment of syphilis revealed penicillin to be the drug of choice in congenital syphilis and to be useful in syphilis of the brain and spinal cord when used in conjunction with artificial fever. Studies were initiated using a combination of one of the arsenic antisypilitic drugs and penicillin as a rapid cure for syphilis. Several years would be necessary to evaluate this form of therapy fully. The preliminary results were promising.

At the end of 1946, controls on the distribution of streptomycin were lifted, and it became generally available. It was shown to be effective in the treatment of tularaemia (rabbit fever), influenzal meningitis, certain blood stream infections and in certain kidney and bladder infections. Results were disappointing in typhoid fever and undulant fever.

Results of streptomycin therapy of tuberculosis continued to be encouraging, but the general impression gained from the studies was that streptomycin would find its usefulness as an adjunct to other forms of treatment.

Streptomycin given in conjunction with promin (sodium 4,4'-diaminodiphenylsulfone-N,N'-didextrose sulfonate), a drug related to the sulfonamides, gave promise of being useful in the treatment of leprosy. The studies had not progressed far enough to draw any definite conclusions.

PENICILLIN MANUFACTURING PLANT of the British government at Speke, Eng. Air used in the production of the drug is cleaned and sterilized in these towers. Penicillin was made available in British drug stores at controlled prices in 1946

During 1946, additional information on five effective anti-malarial drugs became available. Quinacrine (atabrine), the drug used extensively by the armed forces during World War II, was made available to the civilian population for the suppression of malaria. Chloroquine, 7-chloro-4-(4-diethylamino-1-methylbutylamino) quinoline, was found to be effective for the suppression of malaria, particularly *vivax* malaria, as encountered in the South Pacific and Mediterranean areas. It might be a cure for *falciparum* malaria, but more experience was needed. Pamaquine is effective in curing some cases of *vivax* malaria, but is too toxic for routine use. It may be used with quinine effectively. Pentaquine, 6-methoxy-8-(5-isopropylamino-oamylamino)-quinoline, another antimalarial developed during World War II but not available, was found to be effective in curing *vivax* malaria when given with quinine. It was too toxic to be administered alone in doses sufficient to suppress or cure the disease. Paludrine (N₁-p-chlorophenyl-N₅-isopropylbiguanide), was found to have actions similar to Quinacrine, but its administration led to less undesirable side-effects, and it proved more useful for medication of large numbers of troops.

The atomic fission plants began producing radioactive elements for medicinal purposes during 1946. Extraordinary precautions were taken to protect the medical investigators and patients from possible harm from these potent substances. Although most of the radioactive elements found their chief usefulness as "tracer" substances for studying the chemistry of body processes, two of them, radioactive phosphorus and radioactive iodine, found therapeutic application.

Radioactive phosphorus was found useful in treating polycythemia, a condition characterized by too many circulating red

blood cells. Its use in leucaemia was disappointing, although, in some instances, temporary alleviation of symptoms was noted.

Radioactive iodine was reported effective in the treatment of toxic goitre. Too few persons could be treated to determine how lasting the effects might be, but the preliminary results were so encouraging as to create a large demand for this substance.

A group of chemicals developed for use as poison gases were found to have profound physiological effects. The nitrogen mustards (related to ordinary mustard gas) were discovered to produce effects similar to exposure to X-rays. They cause destruction of white blood cells and were tried in leucaemia, Hodgkin's disease and some forms of cancer. The results were disappointing although temporary benefits were observed.

Another product of war research, diisopropyl fluorophosphate (DFP), was found to be useful in the treatment of glaucoma, a disease of the eyes which frequently leads to blindness. The previous treatment involved repeated instillations of physostigmine into the eye; DFP in peanut oil could be used once a day or once in several days and was found to exert better control of the disease than the older drug.

A widespread tropical disease, kala-azar or leishmaniasis, was found to respond well to treatment with any of several antimony compounds, among which neostibosan, stibanose, stibatin, urea stibamine and stilbamidine were found most effective. Stilbamidine was found to be particularly useful in the form of kala-azar affecting the abdominal organs.

Typhus fever, scrub typhus and Rocky Mountain spotted fever were shown to respond encouragingly to para-aminobenzoic acid, a substance long known to inhibit the action of the sulfonamides.

The synthesis of folic acid was announced, and it was shown that this substance was effective in controlling the symptoms of pernicious anaemia, nutritional anaemia and tropical sprue in the same manner as liver extract. Since folic acid may be taken by mouth, the treatment of these diseases may be greatly simplified for the patient.

The United States public health service reported an extensive study on the control of ringworm in children, in which a variety of medicaments were used. They concluded that an ointment containing either salicylanilide or copper undecylenate was the most effective for treatment of this common condition.

Drugs for the treatment of allergies such as hay fever, hives and asthma continued to be studied. Besides Benadryl (beta-dimethyl aminoethyl benzhydryl ether hydrochloride), another antihistamine drug, Tripeleminamine or Pyribenzamine (N,N-dimethyl-N'-benzyl-N'-(d pyridyl)-ethylene diamine) was found to be effective in seasonal hay fever and hives. Somewhat less than half of the cases of seasonal asthma responded to the drug. It produced side effects similar to Benadryl, namely drowsiness, nausea and headache.

Tridione, a drug effective in the treatment of petit mal epilepsy was found to cause destruction of the blood cells in a few cases. Physicians were cautioned to watch closely patients under treatment with this drug.

A new antiseptic, Furacin (5-nitro-2-furaldehyde semicarbazone) was found to be useful in treating wounds. Administered in the form of an ointment, it often controlled bacteria which had failed to respond to either penicillin or streptomycin.

A crystalline substance, rutin, a flavone, found in a wide variety of plants was prepared commercially from buckwheat. Rutin was claimed to exert an action on the walls of capillary blood vessels, preventing them from bursting in persons with high blood pressure or with diseases which cause the capillaries to become more fragile. Investigations on this substance were continuing.

During 1946, investigations on protein hydrolysates, which contain amino acids, the building blocks of body proteins, were advanced. They were found to be of value in preparing patients for surgical operations, in maintaining nutrition in patients unable to take food by mouth, in treating certain forms of liver and kidney disease, and perhaps in the treatment of stomach and intestinal ulcers. Reports from European concentration camps indicated that protein hydrolysates were not of expected value in treating severely starved persons, but purified whole protein taken by mouth was of greater value. It was found that purified whole egg protein most nearly approached an ideal protein for medical purposes.

Influenza type A and B vaccine became generally available during the year. The low incidence of influenza during the latter half of the year did not permit an evaluation of the large-scale use of this vaccine in preventing the spread of epidemics of influenza.

Two new vaccines were developed, one for tularaemia, (rabbit fever) and one for psittacosis (parrot fever). It was claimed that these vaccines were effective in preventing or decreasing the severity of the disease in persons exposed.

Although many of the advances made in chemotherapy during the war were revealed during the year, much remained undisclosed. Initiated during the year were concerted attacks on the treatment of cancer with sex hormones, the treatment of infantile paralysis with curare, the South American arrow poison, the study of substances, such as paraminobenzoic acid, amino acids, and adenylic acid derivatives, which may act to "block" viruses from entering or living in body cells. (See also DENTISTRY; MEDICINE; PNEUMONIA; SURGERY; UROLOGY; VITAMINS.) (W. V. WE.)

Chemurgy. Research in the fields of new crops, new uses for agricultural products and for agricultural residues received substantial impetus during 1946. Congress provided the department of agriculture with \$40,000,000 of new research money, portions of which were directed to be used to develop new crops and to extend the industrial outlets for farm materials. Two new nongovernmental laboratories began full operation.

The Midwest Research institute, with a staff of more than 90 persons, was privately financed to serve the six-state area around Kansas City, Mo., where the institute is located. Besides offering facilities for research to be paid for by industries of the region, the program called for special studies, many of which were to centre on the agricultural materials available for industrial uses.

At Birmingham, Ala., the Southern Research institute opened with a similar program to serve the states of the south. With more than \$1,000,000 collected, and a staff of about 40 persons, the Southern Research institute had launched numerous projects looking to more profitable utilization of southern farm raw materials.

A number of state legislatures increased the funds available to state universities and experiment stations for chemurgic types of research.

The rise of synthetic fibres directed greater attention to research as a means for widening the demands for cotton. Three important approaches were studied by the Southern Regional Research laboratory of the department of agriculture, located at New Orleans, La.

The automobile tire industry, one of cotton's largest markets, had been invaded by rayon. Private cotton seed producers had developed new cotton strains with stronger fibres. These, studied by the regional laboratory and tested by tire companies, were found to be superior to the older cottons, and

A PISTON BEING CLEANED of carbon by blasting with a mixture of ground corncobs and whole rice hulls in a demonstration in 1946

showed promise of helping the natural fibre to hold a place in tire manufacture.

Rotproofing of cotton fabrics by partial acetylation was successfully established. The process was expected to be commercially important in such fields as sandbags, seedbed covers, yarn for electrical insulation in tropical climates, fish-net twines, boat lining and bags for covering hams for export. The treatment prolongs considerably the life of the fabrics used for such purposes.

Under study also were methods for improving the resistance of cotton fabrics to wind and rain.

Meanwhile new synthetic fibres from agricultural materials were emerging. A peanut protein fibre, given the name of Sarelion, was announced by the Southern Regional Research laboratory. Still in the laboratory stage, it was reported to possess some of the desirable qualities of wool along with the common weakness of other synthetic protein fibres, which is low strength when wet.

Zein, the protein extracted from corn and commercially produced for coatings and plastics, was the source of another vegetable synthetic fibre announced in 1946. A strong fibre, it promised to lend itself to economical production and use since it can be extruded, spun and finished by continuous process methods.

Still under study at the Western Regional Research laboratory and in commercial laboratories were the keratin protein fibres made from chicken feathers. Here also the main problem is to overcome the weakness caused by moisture. The chicken feather material is especially attractive from a manufacturing viewpoint, since some 175,000,000 pounds of the feathers are wasted annually. The commercial demand is limited to small quantities for cushion stuffing. The feathers are easily available at chicken packing plants.

Paint brush bristles from milk, by way of casein, appeared in commercial markets. A Maryland factory began their manufacture during 1946. Their uniformity and durable quality were expected to make the synthetic bristles a permanent competitor for the natural animal bristles which no longer could be obtained reliably from the former sources in Manchuria.

Leather manufacturers welcomed the progress which might give them a domestic supply of vegetable tanning materials. Synthetic tanning substances had been expensive, and the imported quebracho and sumac had been in short supply. Considerable progress was reported in both production and processing methods with the canaigre root. New Mexican experiments produced roots at an average annual yield of 11.5 tons. The roots are harvested, however, three years after planting the seed.

At Beltsville, Md., the department of agriculture was growing selected strains of sumac, seeking kinds which might be profitably cultivated for the leaves, which contain as much as 40% tannin. Tanning tests made with the products both of canaigre root and sumac leaves had indicated that from a quality standpoint either could compete successfully with imported tannins. The results lend hope that they might result in two new crops for U.S. agriculture.

The paper industry announced in 1946 the successful establishment of guar as a new domestic crop. The industry required a type of mannogalactin mucilage in paper-making processes to improve the opacity, printing quality and other characteristics of certain kinds of paper.

After extensive search guar, a plant from India, was found to be a suitable source. Planting in Arizona proved to yield an abundance of the seed from which the material is extracted. Guar was being produced in 1946 under contract by Arizona farmers. The product was said to have potential uses in cosmetic and pharmaceutical industries.

Further progress was reported during the year with the growing and processing in Florida of ramie, the remarkable Chinese fibre which had formerly resisted mechanical methods for decoration and degumming.

The \$7,800,000 sweet potato starch plant of the United States Sugar corporation at Clewiston, Fla., moved into full operation during the year. It was consuming at capacity the product of more than 12,000 acres, making more than 50,000,000 pounds of starch and 20,000,000 pounds of livestock feed, and creating new employment for nearly 2,500 workers.

Cherries: see FRUIT.

Chess. The death of Dr. Alexander A. Alekhine on March 24, 1946, at Lisbon, Portugal, left chess without a world champion, but the game picked up considerably in international competition. No less than five major tournaments were held in Europe during the year. Dr. S. Tartakower of Poland won the first postwar tournament at Hastings, England, while Dr. Max Euwe of Amsterdam, Holland, and Herman Steiner of Los Angeles, Calif., were first in a two-division meet at London.

Dr. Michael Botvinnik, the Russian champion, featured a most successful season for the soviet union by winning a masters' test at Groningen, Holland. Mendel Majdorf of Poland won an international tournament at Prague.

In the United States, Samuel Reshevsky of Boston, Mass., was returned to his national championship throne, marking his 8th U.S. championship. Steiner won the national open championship, while A. E. Santasiere of New York won the New York state, and I. I. Kashdan the Metropolitan titles. Larry Friedman of Cleveland was crowned national junior champion, and Miss N. May Karff of Boston won the women's national tournament.

In international team competition, Russia was supreme. The U.S.S.R. defeated Great Britain, 18 to 6, in a four-day radio match, and overcame the United States, 12½ to 7½, in Moscow.

DEMONSTRATION CHESSBOARDS on which all moves were repeated for the benefit of spectators at the International Chess match held from Aug. 20 to Sept. 7, 1946, at Groningen, Holland

Elbert A. Wagner Jr., of Chicago was elected president of the United States chess federation. (M. P. W.)

Chiang Kai-shek (1887-), president of the republic of China, commander in chief of all military forces, director-general of the Kuomintang, and the undisputed leader of China during eight years of war against Japan, faced greater difficulties in solving the problems of national unification and reconstruction in 1946. Repeatedly he stated that China's major problems in 1946 were: restoration of peace and order, completion of the plans for national rehabilitation, nationalization of the armed forces, preservation of national sovereignty, consolidation of world peace and inauguration of a constitutional government. Chiang failed to reach agreement with the communists in solving these problems, was openly attacked by them and criticized by leaders of the other minority parties. Chiang's prestige began to suffer, but he continued to receive honours from abroad, including the United States distinguished service medal and an honorary doctor's degree from Liège university, Belgium, as a tribute to his contribution toward the winning of the war against aggression.

With the removal of the capital from Chungking back to Nanking on May 1 Chiang returned to Nanking. In the latter part of May President and Madame Chiang visited Manchuria where the national troops and the communists struggled for military and political domination. By western calculation Chiang was 59 on Oct. 31, 1946, but the Chinese nation celebrated his 60th birthday on that day. On the same day his term of office which had expired was extended "until the date of the assumption of office by a new president duly elected after the inauguration of the new constitution." On Nov. 28 Chiang formally presented the revised draft constitution to the national assembly which met without the communists. In his speech to the national assembly he declared that at the age of 60 he had no more political ambition.

Chiang was born in a humble family in Feng-hwa, Chekiang, and educated in military schools in China and Japan. In 1911

he became a faithful follower of Sun Yat-sen, who sent Chiang to Russia in 1923 to study Russian military science and revolutionary tactics. In 1926 Chiang led the northern expedition and in 1927 established the national government in Nanking and married Mei-ling Soong. For 20 years thereafter he had been continuously in power. (See also CHINA.)

Chicago. Second largest U.S. city, a port of entry and the county seat of Cook county, Ill., at the southwest corner of Lake Michigan, Chicago is the largest centre of U.S. rail traffic and of long-distance domestic air routes. Mayor in 1946: Edward J. Kelly.

The population of the city proper by the federal census of 1940 was 3,396,808. The white population numbered 3,115,379, nonwhite 281,429. The population of the 1,184.2 sq.mi. comprising the metropolitan district was 4,499,126. At the close of 1946 Frederick Rex, head of the municipal reference library, estimated the population of the city proper at 3,594,899.

Although the city's industries and traffic suffered severe losses from strikes in 1946, especially the railway strikes and the two coal strikes, paralyzing the Chicago Switching district, world's largest coal-consuming area, production and employment were at capacity levels at the end of the year. Only 3,300 persons were added to relief rolls in 1946, bringing the total to 21,700 compared with 279,000 in 1939.

Outstanding public improvements of 1946 were the acquisition of the new municipal airport, former proving ground for the Douglas aircraft manufacturing war plant and beginning of the last phases of construction of the Dearborn St.-Milwaukee Av. subway.

In the off-year elections of 1946 a record vote was polled resulting in the defeat of the Democratic organization, led by Mayor Kelly, which had ruled Chicago and Cook county with no serious challenge from 1931. Total votes cast were 2,112,464 (80.60% of the registration). Four incumbent Democratic representatives in congress were defeated, making the representation of the Chicago area five Democrats and five Republicans. The Democratic organization suffered the loss of all but 6 of the 18 major county offices contested and those Democrats who won had scant margins. Later Mayor Kelly announced that he would not be a candidate for re-election in 1947.

Reorganization of the Chicago school board through resignation of members closely identified with the dominant political organization and their replacement by members recommended by educational and civic organizations was the other marked political change of the year.

Chicago's program of free food, lodging and entertainment for soldiers, sailors and marines was concluded Sept. 3, 1946, when the 22,767,474th serviceman's signature was added to the register of the last open U.S.O. centre.

Passenger arrivals and departures at Chicago airports for scheduled air lines numbered 2,488,191, an increase of 87.2% over 1945.

Chicago crimes in 1946 included 231 murders, 346 rapes, 1,809 assaults, 3,672 robberies, 64 manslaughters, 9,921 burglaries, 15,224 larcenies, 2,989 automobile thefts. Total number of crimes was 33,075 compared with 38,259 in 1945. Fires numbered 42,893, deaths in automobile accidents 853.

Marriage licences issued numbered 66,622; divorce bills filed 20,882. Hospital records at the close of the year indicated a record number of births. Enrolment of city schools increased 13,779 to a total of 340,279.

The 1947 budget for the city of Chicago and related govern-

mental units such as the sanitary district and park board called for \$233,558,637, exclusive of the school board which had a budget of \$78,879,654 in 1946. Total deposits of all Chicago banks totalled \$5,799,906,000 at the end of 1946 compared with \$5,844,267,000 one year before. (L. H. L.)

Chicago, University of. An institution of higher education and research in Chicago, Ill. Founded in 1891, the university was privately endowed, coeducational and nonsectarian. In the academic year 1945-46 the university conferred 1,316 degrees, of which 719 were bachelor's (including 442 bachelor's degrees for general education conferred in the college, which admits students into its 4-year program after the sophomore year of high school), 293 were master's degrees in the arts and sciences, 97 were doctor of philosophy degrees and 207 were professional degrees in business administration, divinity, law, medicine and library science.

After exclusion of income used for auxiliary enterprises and restricted expendable funds, as well as most of the income received and paid out on numerous contracts with the U.S. government for war purposes (all nonprofit undertakings), the estimated regular budget income for the year 1946-47 was \$12,718,490, an increase of \$1,907,130 over the previous year. The total current income for the year 1945-46 before the exclusion mentioned above was \$20,593,580, and the comparable estimated total current income for 1946-47 was \$21,289,492. Gifts for all purposes for the 1945-46 period amounted to \$2,797,981, an increase of 18.5%. Endowment funds as of June 30, 1945, were \$72,521,247, and the book value of all the university assets was \$137,769,656.

The most spectacular of the new developments at the University of Chicago during 1946 were the three institutes—the Institute of Nuclear Studies, the Institute of Radiobiology and Biophysics and the Institute for the Study of Metals.

In the Institute of Nuclear Studies, two-thirds of staff time was being devoted to fundamental studies of the properties of the nuclei and the other third to making nuclear energy available for peacetime purposes. The university's cyclotron was being reconverted, and plans were being made for securing a new and larger cyclotron that would enable the radio chemists to produce new transuranic elements, such as americum and curium, and to study their properties. A 100,000,000-volt betatron was also purchased for major experimental activities. In the Institute for the Study of Metals metallurgists, physicists and physical chemists were brought together to study the fundamental problems of metals, the behaviour of metals, the relations of their behaviour to their structure and the mechanisms whereby the various types of structure were obtained. The Institute of Radiobiology and Biophysics was to study the biological effects of radiation and the physical structure and physical functions of biological systems.

The Argonne National laboratory, formerly the Metallurgical laboratory, was being operated in 1946 by the university for the Manhattan district on a basis which permitted participation by the staffs of 25 universities and other research organizations in the middle west interested in nuclear research. Walter H. Zinn, associate professor of physics at the university, was director of the Argonne in 1946.

A second new project at the university during the year was a program of research and planning, in municipal planning, set up in co-operation with the Public Administration Clearing House, the American Society of Planning Officials and with the Chicago chapter of the American Institute of Architects. Rexford Guy Tugwell, former governor of Puerto Rico, was appointed professor of political science to take charge of this

work.

Another new project at the university originated in the interest which members of the faculty had in political theory and practice. Convinced that the next war would destroy civilization and that the only protection against war was the formation of a world government, Richard P. McKeon, dean of the division of humanities, and G. A. Borgese, professor of Italian literature, proposed that a committee be formed to frame a world constitution, not for the purpose of having it adopted—though they would not object to that—but for the purpose of discovering what a world constitution would look like and what the actual difficulties would be in drafting one and in getting it adopted. A committee was formed, with McKeon as chairman.

Broad extension of the University of Chicago's already extensive work on the cause and cure of cancer into a program that would be one of the largest in the world was established at the university through the generosity of the Goldblatt Brothers foundation, which pledged \$1,000,000 for the erection of a new cancer hospital. A capital fund of \$4,000,000 and annual support of approximately \$600,000 was contemplated for use of the new Nathan Goldblatt Memorial hospital. The 2 powerful instruments, the betatron and the 92-in. cyclotron, were also to be included in the equipment of the cancer centre for studies in radiation therapy of cancer. With the increased supply of radioactive materials provided by the atomic piles, the Institute of Radiobiology and Biophysics planned to carry out a study of cancer treatment.

About 30 individual research projects, ranging from basic studies such as cell division to clinical work in surgery and medicine, were under way at the university at the close of 1946, involving 15 departments in the natural sciences and clinical areas.

Seven months after the end of World War II the university's role in poison gas warfare research was revealed. A top secret on the Midway, the toxicity laboratory tested 1,500 chemical compounds, many of them far more lethal than those used in World War I. The laboratory was operated by the university under the auspices of the Office of Scientific Research and Development and later by the chemical warfare service of the U.S. army.

Chancellor Robert M. Hutchins on his request was granted a leave of absence beginning Oct. 1 for the academic year ending June 30, 1947, to participate in the expanded adult education activities of the Encyclopædia Britannica, Inc., and its affiliated company, Encyclopædia Britannica Films Inc. The university became affiliated with Encyclopædia Britannica, Inc., in 1943. At Britannica, Hutchins was chairman of the board of editors of Encyclopædia Britannica, Inc., chairman of the executive committee and director of the Encyclopædia Britannica Films Inc. Ernest Cadman Colwell, who was made president of the university in 1945, exercised the powers of chancellor during Hutchins' leave.

Approximation of housing space for students for the university's record enrolment, 12,366 (5,000 of whom were veterans) was provided by prefabricated dormitories, apartments and separate houses. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

Chiefs of Staff, The Combined: see COMBINED CHIEFS OF STAFF, THE.

Child Labour. Efforts to protect children and youth from harmful labour, interrupted to a greater or lesser degree in most countries by World War II, were again evident by 1946 in countries where sufficient economic and political stability prevailed. World-wide concern for the wel-

fare of young workers appeared in the discussions at the International Labour conference in Montreal, Que., Canada, in the fall of 1946 and definite advances were made during the year in Great Britain, the British dominions and the United States.

United States.—Under the president's Reorganization plan the administration of the child-labour provisions of the Fair Labor Standards act and the program of research and promotion of standards for child labour and youth employment carried on by the children's bureau were retained in the department of labour when the children's bureau, with the exception of its industrial division, was transferred to the Federal Security agency. To keep intact the department's full program in the child-labour field the industrial division of the bureau was transferred as an organizational entity to the division of labour standards, where it became the Child Labor and Youth Employment branch of that division.

Federal Interagency Committee.—The Federal Interagency Committee on Youth Employment and Education, made up of representatives of federal agencies dealing with employment and education of young people to facilitate joint planning in those fields, submitted a report to the director of war mobilization and reconversion. This report recommended a nation-wide program for youth, including school programs to serve the individual needs of all young people, removal of financial barriers to school attendance, suitable job opportunities, good standards of employment, good counselling and placement services and community action on behalf of youth to bring into play all available resources.

Facts About Youth Employment.—Although during the year 1946 war pressures on the labour market were eased and industrial reconversion proceeded rapidly, the volume of employment of young persons did not drop so rapidly as might have been expected. During World War II labour shortages had brought about great increases in the number of children and young people at work, a lowering of legislative child-labour standards and a trend toward longer hours and less favourable working conditions.

Sample labour-force surveys made monthly by the U.S. bureau of the census indicated that almost 3,500,000 boys and girls 14-17 years of age were at work in April 1945, a school month, with many more working during the summer peak. Of these 3,500,000, about $\frac{1}{2}$ were believed to be working full time and not attending school; the other half, working in addition to going to school. By April 1946 the number of employed minors 14-17 years had dropped to about 2,225,000, but even this was more than twice the number working when the decennial census was taken in March 1940. Of those working in April 1946, about 750,000 were 14 or 15 years of age (16% of the population of these ages). Many children under 14, who were not included in these official counts, were employed in both 1945 and 1946.

Child-Labour Legislation.—Many of the weakening amendments to state child-labour and school-attendance laws that were passed during World War II were revoked soon after V-J day. In general, these relaxations did not affect the basic minimum ages for employment and some states were able to strengthen their child-labour laws in spite of wartime pressures. For instance, a comparison of the legislative picture at the end of 1946 with that of 1941 shows that 2 states (Georgia in 1946 and Louisiana in 1942) and Puerto Rico had been added to the group with a basic 16-yr. minimum age for employment, bringing the total to 17 jurisdictions with this standard.

During World War II a few modifications of the child-labour provisions of the federal Fair Labor Standards act were sanctioned, permitting employment of 14- and 15-year-old children in specified non-manufacturing and nonmining occupations under carefully safeguarded conditions. Wartime amendments to 2 hazardous-occupations orders permitted minors of 16 and 17 years to perform a few of the less hazardous jobs connected with logging operations and with the operation of wood-working machines. Practically all these modifications were revoked shortly after V-J day. A new hazardous-occupations order was issued, effective Sept. 1946, establishing a minimum age of 18 in the operation of elevators and other power-driven hoisting apparatus.

International Movements.—The 29th session of the International Labour conference held in Montreal Sept. 19-Oct. 9, 1946, adopted draft conventions for presentation to member states on: (1) medical examinations of children and young persons for fitness for employment in industry, (2) medical examinations of children and young persons for fitness for employment in nonindustrial occupations and (3) restriction of night work of children and young persons in nonindustrial occupations. These conventions contained the basic standards. In addition, two recommendations dealing with methods of applying the conventions were adopted. The conventions on medical examinations required such examinations as a prerequisite for employment of minors under 18 in both industrial and nonindustrial occupations and at least annually up to 18 years of age. The night-work convention required prohibition of employment of young persons between 14 and 18 yr. of age for at least 12 consecutive night hours and for at least 14 consecutive night hours for children under 14 and for those more than 14 subject to full-time compulsory school attendance.

Great Britain.—Steps were taken to put into effect on April 1, 1947, the provision of the new Education act for England and Wales raising from 14 to 15 yr. the age up to which children must attend full-time school and the minimum age for employment during school hours. Asked the order of priority for the projected developments envisaged in the act, Miss Ellen Wilkinson, minister of education, replied that buildings to accommodate the additional pupil load accompanying the raising of the compulsory school age, to provide for training for industry, training of teachers, school meals and schools to serve new housing developments were most urgently needed. She pointed out also the urgency of reorganization of secondary schools and the development of county colleges.

A new Education act for Scotland setting this standard with respect to school attendance and employment during school hours as the act for

England and Wales received the royal assent Nov. 6, 1946. A similar act for Northern Ireland was introduced in parliament but had not become law by the close of the year 1946.

Wartime regulations under the Factories act, 1937, lengthening the working hours permitted for children under 16 in textile factories from 44 to 48 a week, expired on Dec. 31, 1946. Requests for the further extension of the expiration date were refused by the minister of labour after a public inquiry.

Canada.—The Province of Prince Edward Island passed, in April 1945, an "Act to carry out the International Labour Convention (1937) concerning the minimum age for the admission of children to industrial employment," which embodied the terms of that convention, both as to employments covered and as to the 15-year minimum age.

Children's Books. With a return to a semblance of the former volume in publishing, children's book production considerably exceeded that of 1945. Old favourites were brought back into print, attractive new editions of the classics appeared and the general format showed improvement as to quality of paper and colour reproduction. The year was significant, as it marked the centenary of two great English artists, Randolph Caldecott and Kate Greenaway. Heartfelt appreciation and a deep awareness of the contributions of these artists were expressed by Anne Carroll Moore in her *A Century of Kate Greenaway* and by Mary Gould Davis in her *Randolph Caldecott, 1846-1886, an Appreciation*. Covelle Newcomb in *The Secret Door* successfully portrayed the life of Kate Greenaway for older girls.

Books for family enjoyment were *Miss Pennyfeather and the Pooka* by Eileen O'Faolain, Maurice Dolbier's *The Magic Shop* and William Maxwell's *The Heavenly Tenants*. Humorous picture books were represented by *Who Blew that Whistle?* by Leone Adelson, *Cap'n Dow and the Hole in the Doughnut* by Le Grand (Le Grand Henderson) and by the inimitable *Pan-cakes for Breakfast* by Grace Paull, while humour in verse appeared in Nancy Turner's *When It Rained Cats and Dogs* and in the compilation of Carl Withers' *Counting Out*. Preschool boys enjoyed *The Little Fire Engine* of Lois Lenski and *The Runaway Shuttle Train* by Muriel Fuller and chuckled over *Timothy Turtle* by Al Graham. Two picture books of distinction were *The Little Island* by Golden MacDonald and Alvin Tresselt's *Rain Drops Splash. How Big is Big?* by Herman and Nina Schneider answered young questioners and *Twelve O'Clock Whistle* by Jerrold Beim and Ernest Crichlow demonstrated the principle of co-operative effort. *The Brave Bantam* by Louise Seaman and Roberta Whitehead's *Peter Opens the Door* interested the three- to six-year-olds, while the d'Aulaires (Ingri and Edgar) added to their picture biographies with *Pocahontas*. Excellent photographs illustrated *My Dog Rinty* by Ellen Tarry and *Johnny and his Mule* by Ellis Credle. Easy-to-read stories appeared by Carolyn Haywood, Eleanor Lattimore and Jo and Ernest Norling.

Folk literature was enriched by *Prince Godfrey* by Halina Gorska, *The Runaway Soldier* of Fruma Gottschalk, by E. Balintuma Kalibala's *Wakaima and the Clay Man* and by *The Tiger and the Rabbit* of Pura Belpré. Octave Feuillet produced a book of special interest in his *Punch: His Life and Adventures*.

Dolls were the theme for *Miss Hickory* by Carolyn Bailey, *Marta the Doll* by Eloise Lownsbey and *Nobody's Doll* by Adele de Leeuw.

Minority groups were represented in *The Burro Tamer* (Spanish-Americans) of Florence Hayes, *Chukchi Hunter* (Eskimos) by Dorothy Stall, *Blue Ridge Billy* (mountain folk) of Lois Lenski and in Marguerite de Angeli's *Bright April* (Negroes).

India was the setting for Jean Bothwell's *Thirteenth Stone* and for *Paji* by Esther Kiviat. Modern China was the locale of *The Bamboo Gate* by Vanya Oakes while history was covered in *China's Story* by Enid Meadowcroft. Chuckles were aroused by Glenn Blough's *Monkey with a Notion* and by *Narizona's Holiday* by Addison Burbank. *Let's Find Out* by Herman and Nina Schneider was a book of simple experiments, and two nature books were Henry Kane's *The Tale of the Wild Goose* and *Animal Inn* by Virginia Moe. Notable illustrations characterized Conrad and Mary Buff's *Big Tree*, while Robert Lawson displayed a new style in his pictures for Tom Robinson's *Greylock and the Robins*.

Pleasant home life was pictured in *The People Upstairs* by Phyllis Coté and in *The Wonderful Year* by Nancy Barnes. Sequels were written by Alice Dalgliesh, Elizabeth Coatsworth and Maud Lovelace, and boys met old friends in the books of Howard Brier, John Tunis and Howard Pease. *The Avion My Uncle Flew* by Cyrus Fisher was an unusual aviation story.

Horse stories were prevalent; girls enjoyed *Shooting Star Farm* by Anne Molloy and Regina Woody's *Starlight*, while boys read *Strawberry Roan* by Don Lang and *Mountain Pony* by Henry Larom. U.S. historical stories were welcomed from such popular authors as Hildegard Hawthorne, Stephen Meader and Merritt Allen.

England in the 13th century was the setting of Jane Gilbert's *Imps and Angels*, Elizabethan England was pictured in *Romany Luck* by Patricia Gordon and the King Arthur legends featured Eleanor Jewett's well-written *The Hidden Treasure of Glaston*.

Arts and crafts were represented by Tina Lee's *What to Do Now* and songs and music were found in Opal Wheeler's *Sing in Praise*, in *Gilbert and Sullivan Songs for Young People* arranged by Margaret Bush and in *Keep Singing, Keep Humming* by Margaret Bradford.

Biographies were written about such personages as Thomas Jefferson, John Smith, Dolly Madison, Eleanor Dickinson, Robert Fulton, Sun Yat-sen and Paul Robeson.

Older girls read Gladys Malvern's *Gloria, Ballet Dancer*, *Great Day in the Morning* by Florence Means, *Going on Sixteen* by Betty Cavanna, while those with a flair for T. H. White revelled in *Mistress Masham's Repose*.

Books concerning the nativity and Christmas celebrations ranged from Alta Seymour's *A Grandma for Christmas* to *Pedro, the Angel of Olivero Street* by Leo Politi and *A Little Child* compiled by Jessie Orton Jones.

Invaluable was *Treasure for the Taking*, a rich bibliography on children's books by Anne Eaton. Attractive new editions of Howard Pyle's *The Merry Adventures of Robin Hood*, *Arabian*

Nights, edited by Andrew Lang, *Dandelion Cottage* (Carroll Rankin) and *Understood Betsy* (Dorothy Canfield) appeared. (See also BOOK PUBLISHING; PRIZES OF 1946.) (E. A. Gs.)

Children's Bureau, United States: see CHILD WELFARE.

Child Welfare. Continental Europe.—During 1946 the devastating effects on children of World War II were still evident, particularly in combat-torn territories. The extensive aid given to many countries by the United Nations Relief and Rehabilitation Administration was insufficient to meet the needs. Reports from various areas indicated a high child mortality rate and a shortage of food, fuel, clothing and other necessities. Many schools and institutions for children were destroyed during the war; their rebuilding was retarded by lack of materials. Thousands of children were still in camps for displaced persons.

In spite of these difficulties, some economic improvement in several countries made possible steps toward rebuilding child welfare services. In France, e.g., the organization of a nationwide uniform system of services for mothers, babies and young children was ordered in Nov. 1945. This act, aimed mainly at the reduction of infant and child mortality, calls for, among other things, the setting up in each district of clinics for expectant mothers, and for babies and young children, with facilities for medical supervision of the health of these persons. Protection of school children's health on a uniform national basis, instead of through the heretofore scattered local efforts, was regulated in Oct. 1945. All this work was placed under the control of public health authorities.

Family allowances and other forms of aid to families in France, which had been available from before World War II, were increased and new kinds of benefits were introduced by law in Aug. 1946. This law provides for childbirth benefits payable under specified conditions in the form of a lump sum on the birth of each child; family allowances for the second and each subsequent child from birth until the end of compulsory school attendance, and later in some cases; single wage benefits for couples whose income consists of the wages of husband or wife only; and prenatal benefits which may be paid for the entire duration of pregnancy. In May 1946 the benefits of social security were extended by law to all French citizens, instead of only to wage earners as formerly, and will be paid after industrial production reaches a specified level. Measures for better enforcement of the school attendance law were prescribed in May 1946 and an interdepartmental committee was organized in October of that year to formulate plans for the study of cases of children and youth who are morally endangered, delinquent, or war victims.

In Czechoslovakia family allowances for children under 18 were introduced by a law of Dec. 1945.

In Denmark the legislation on public welfare was amended and codified in Aug. 1946. Among other subjects, this law regulates supervision over children in boarding homes; children of illegitimate birth; children who are neglected or mistreated or who present behaviour problems; children whose mothers receive temporary public aid; and children of widows or widowers and orphans for whom regular allowances are paid. This law was administered by a national board, a chief inspector of child welfare assisted by a staff of inspectors, and by local child welfare committees.

In Norway free medical and dental services for school children, which were discontinued during the war, were re-established, and the serving of meals for these children was resumed in the city of Oslo.

In the soviet union measures for more extensive health serv-

DRAWING from *Strawberry Girl* by Lois Lenski for which she was awarded the Newbery medal in June 1946

ices for mothers and children were prescribed in a five-year plan for the economic reconstruction of the country; the work under the plan began early in 1946. In July of that year measures were ordered for improving the health services for children in kindergartens and schools in the more important cities, and the work was delegated to special physicians.

In Sweden a decree of June 1946 provided government aid for free school lunches for all children, not only in the primary schools as previously but also in the intermediate, secondary and technical schools. A compulsory health insurance law with cash benefits and medical care for the insured and their families was enacted on Dec. 18, 1946, to become effective in 1950.

In Turkey under a law of 1945 on maternity insurance, effective July 1, 1946, insured women and wives of insured men receive medical care during pregnancy and confinement and cash benefits.

Great Britain and the British Dominions.—In Great Britain the report *On the State of Public Health During Six Years of War*, published by the ministry of health in 1946, showed that the birth rate rose from 14.8 per 1,000 living persons in 1939 to 17.7 in 1944; the infant mortality rate per 1,000 live births decreased from 50.57 in 1939 to 45.44 in 1944; and the maternal mortality per 1,000 total births decreased in the same period from 3.10 to 1.92. The same report states that the nutrition of children was somewhat better at the end of the war than in the beginning, because of a more suitable and balanced diet.

By the law on national insurance of Aug. 1946 the previous legislation under which benefits were paid in sickness, childbirth, unemployment and to dependents of a deceased wage earner was extended to include additional categories of persons and new kinds of benefits. The payment of family allowances under a law of 1945 began in Aug. 1946 when about 2,000,000 mothers received their first weekly allowances of \$1 for every child except the first. These allowances are paid for children under 16 and those older if they are serving as apprentices or attending school. A law for a national health service with complete medical care was enacted in Nov. 1946.

In Scotland the education law of Nov. 1946 amended and consolidated previous legislation. It requires as of Jan. 1, 1947, full-time school attendance until the age of 15, instead of 14 as previously, and authorizes its subsequent extension until the age of 16. At the conclusion of this period part-time school attendance will be required to the age of 18. Provision is also made for school children's meals, medical examinations and inspections, and in some cases free treatment.

The United States.—Legislation.—During 1946 congress enacted several measures benefiting children. This legislation almost doubled the appropriations for grants to the states for three programs of the Social Security act; increased federal contribution to the program for aid to dependent children under the same act; provided for research and for demonstration of mental health services, part of them for children, through the National Mental Health act; provided impetus to the building of health centres and hospitals essential for health programs through the Hospital Survey and Construction act; and authorized and defined federal participation in the school lunch program through the National School Lunch act.

Services Under the Social Security Act.—Three services—maternal and child health, crippled children's and child welfare—were carried on with grants under the Social Security act from the children's bureau, U.S. department of labour (after July 16, 1946 in the Federal Security agency). Congress increased their appropriations in August as follows: for maternal and child health from \$5,820,000 to \$11,000,000; for services for crippled children from \$3,870,000, to \$7,500,000; and for child welfare services from \$1,510,000 to \$3,500,000.

The basic maternal and child health services, not available in all counties, showed little change in volume in 1945 from 1944, according to the latest reports. The volume was distinctly smaller than before World War II. In 1946 the services began to expand as physicians and nurses returned from war duty; a few states added programs for mental health and hospital consultation services.

State crippled children's agencies reported the number of crippled children listed on state registers as 424,000 on June 30, 1946, an increase of 36,000 over the previous year. The number of children admitted to clinic service for diagnosis or treatment and of those given medical or surgical care in hospitals was about the same during 1945 as it had been in 1944. Through the 50th week of 1946, 24,955 cases of poliomyelitis had been reported, an increase of 84% over the corresponding period of 1945.

In child welfare services, some 230,000 children were estimated to be receiving services from public welfare workers employed by state or local agencies on June 30, 1946. One-seventh of these children were served by child welfare workers paid in whole or in part from federal funds. In 42 states from which reports were substantially complete, 42% of the children receiving services were living with their parents or relatives; 38% in foster family homes; 15% in institutions; and 5% elsewhere.

Cash-Payment Programs.—The number of children benefiting under programs administered by the Social Security board (after July 16, 1946, the Social Security administration, Federal Security agency) increased, with 431,202 child survivors receiving monthly payments under old-age and survivors insurance (title II) in June 1946. The number of children receiving aid to dependent children under plans approved by the Social Security board was 779,325 in June 1946, 24% higher than in the same month of 1945. On June 30, 1946, some 225,000 children were receiving payments through the Veterans administration because of the death of their fathers. A decreasing number of children received allowances during the year under the Servicemen's Dependents Allowances act.

Wartime Programs.—The emergency maternity and infant care program providing medical, hospital and nursing care for wives and infants of men in the lowest four pay grades of the armed forces decreased during the year. Care was authorized for about 1,365,900 cases from the beginning of the program in April 1943 through Dec. 1946. From July 1, 1945, to June 30, 1946, almost 385,000 cases were authorized for care, most of them maternity cases, though the proportion of care authorized for infants has steadily increased; in Nov. 1946 more than one-third of all care was authorized for infants. Congress appropriated to the children's bureau for grants to the states—\$38,049,900 for the year ended June 30, 1946, and \$16,664,000 for the succeeding year.

The Wartime Program of Child Care Centres for Children of Employed Mothers, financed in part through grants from the Federal Works agency under the Community Facilities (Lanham) act, was discontinued in Feb. 1946. Communities still needing these centres had been allowed an extension of time from Oct. 1945, the closing date announced, to try for local support. Many communities were successful; more than three-fourths of the centres were functioning on March 31, 1946.

Vital Statistics.—See BIRTH STATISTICS.

Juvenile Delinquency.—See JUVENILE DELINQUENCY.

Plans and Action for Children.—The National Commission on Children and Youth, meeting in Dec. 1946, drew up an 11-point program of action. Having determined its goals, the commission was concentrating on ways of reaching them.

HUSKY CHINESE CHILD being weighed at a Chinese National Relief and Rehabilitation Welfare station in Peiping during 1946

Above: **CZECHOSLOVAK BOY** tying new black shoe, part of a complete outfit he received from a relief agency in 1946. The garments were donated by people in the United States during a clothing drive for war-devastated countries

Left: **CHILDREN OF DRANCY, FRANCE**, waiting patiently for the American Red Cross relief workers to distribute new shoes to replace the worn ones they had been wearing, in 1946

Below: **HUNGRY ITALIAN CHILDREN** eating an U.N. R.R.A. lunch at a school at Pietralata, where 600 of them were being cared for during 1946

The American Academy of Pediatrics study of child health services, in which the children's bureau and the public health service co-operated, collected data in 39 states during 1946. A study by the children's bureau of how guardianship laws and procedures affect children was in progress in six selected states during the year.

In accordance with the president's directive of Dec. 1945 to facilitate the admission to the United States of eligible persons displaced from their countries by the war, with special emphasis on orphaned children, nearly 300 European children were brought in during 1946.

In the Other American Republics.—In Chile under a government order made late in 1945 the official National Bureau for the Welfare of Children and Youth was to begin supervision of the work for expectant mothers and for children in the provinces in addition to the capital, where it had charge from 1942.

In Colombia regulations issued in Aug. 1946 require every child welfare institution to provide medical and dental care, elementary education and training in a trade or in farm work. Through social workers, contact must be maintained with the children's families.

In Panamá the appointment of a National Council on Minors was ordered in September for the study of improvements in the child welfare services.

In Peru measures were taken in 1946 for providing better medical care in institutions for neglected and delinquent children.

For a better enforcement of the school attendance law, registration of children of school age was ordered in Guatemala early in 1946. Also in Guatemala a decree was issued in Oct. 1946 for the introduction of a system of social insurance, including sickness and maternity insurance and orphans' benefits. In the Dominican Republic the enactment of a similar law was proposed by the president in Dec. 1946.

In Mexico the second family dining hall was opened in Mexico City in Dec. 1945. At this dining hall, as at the first one which had been in operation from 1941, meals are served at cost and sometimes free to low-income families. Also in Mexico the First National Conference on Health and Welfare, held in Aug. 1946 and attended by about 600 delegates, made recommendations for the improvement of maternal and child welfare services.

International Activities.—A conference of the Central American countries on nutrition was held in February in the city of Guatemala, and a resolution was passed for the establishment of a Central American Institute of Nutrition.

The Fourth Annual Border Health Conference was held in El Paso, Tex. and in Ciudad Juárez, Mexico, late in April 1946, under the auspices of the U.S.-Mexico Border Public Health association. A resolution was passed for establishing a section on maternal and child health and welfare as a part of this association.

The chief of the U.S. children's bureau served as secretary of the Temporary Social commission of the United Nations, on whose recommendation the permanent Social commission was set up in 1946 as part of the Economic and Social Council of the United Nations. The commission planned to take up studies of child welfare among other subjects.

The U.N.R.R.A. was preparing to finish its work in 1947. On recommendation of the council of this organization to the United Nations, the International Children's Emergency fund was established in Dec. 1946.

Also concerned with children were the following specialized agencies of the United Nations: The United Nations Educational, Scientific and Cultural organization, which began to function in 1946; the World Health organization, the constitution of which was adopted by the International Health conference, July 1946; the International Labor organization; and the Food and Agriculture organization. (K. F. L.)

Chile.

A republic fronting on the south Pacific coast of South America for about 2,600 mi., its average width being only 110 mi. Area (official est., 290,085 sq.mi.); pop. (1945 official est.) 5,389,554; density (1944) 18.29 per sq.mi. Racial composition is largely white; mestizos are estimated at 15% and Indians (chiefly Araucanians in the far south) at 5%; oriental and Negro elements are negligible. The bulk of the

population lives in the central valley; Santiago province alone has (1945 est.) 1,535,969 inhabitants (density per sq.mi., 223.12). The capital is Santiago (pop., including suburbs, 1940 census, 952,075). Other important cities (with 1940 census) are Valparaíso (212,072), Concepción (85,938), Viña del Mar (70,013), Talca (45,462), Antofagasta (50,244), Chillán (39,909), Temuco (39,217), Iquique (37,713), Talcahuano (30,082), Valdivia (34,600), Lota (1945 est., 34,445), Rancagua (21,621), Punta Arenas (29,883), Osorno (25,075), La Serena (21,383), Puerto Montt (21,552) and Curicó (19,532). Roman Catholicism was the dominant religion. The constitution of 1925 established a unitary government headed by a popularly elected president serving a six-year term. The bicameral congress is composed of a senate of 45 members and a chamber of deputies of 147. Presidents in 1946: Juan Antonio Ríos Morales, to June 27; Alfredo Duhalde (became acting president, Jan. 17), June 27-Oct. 17; Juan A. Iribarren, Oct. 17-Nov. 3; Gabriel González Videla, after Nov. 3.

History.—Pres. Ríos was compelled by ill health to withdraw from the active presidency on Jan. 17; he was succeeded provisionally by Alfredo Duhalde, leader of the dominant Radical party. Soon after Duhalde's assumption of the presidency he was forced to issue a warning against illegal strikes and on Jan. 22 the government withdrew legal recognition from two striking nitrate unions. Other sympathy strikes followed, culminating in a large protest meeting at Santiago, Jan. 28, during which fighting broke out which caused the death of 9 and the injury of more than 100 persons. The government proclaimed a state of siege and the Chilean Confederation of Labour countered by calling a one-day general strike for Jan. 30. The situation remained critical even after the end of the general strike Jan. 31.

Pres. Ríos died at Santiago June 27. On July 6 Pres. Duhalde set new presidential elections for Sept. 4. Parties on the political right, the Agrarian, Liberal and Conservative, attempted during July to pick a coalition candidate but were unable to agree; their chief possibilities were Eduardo Cruz Coke (Conservative), Arturo Alessandri and José Maza (Liberals) and Jaime Larraín García (Agrarian). The choice of the Radicals (the government party) lay between Gabriel González Videla, former ambassador to France, and Provisional Pres. Duhalde; González ultimately won the nomination. The party on July 27 expelled Duhalde from membership for alleged dereliction of duties. On Aug. 3, however, Duhalde withdrew temporarily from the acting presidency to become a more or less independent presidential candidate; he was succeeded for a brief time by Vice-Adm. Vicente Bielich. Alessandri on Aug. 11 withdrew as a candidate in favour of his son, Fernando Alessandri Rodríguez. Communist support seemed likely at first to go to the party president, Sen. Elías Laferte, but later was given to González Videla. Socialists, led by the veteran Marmaduke Grove, refused to join the leftist coalition and most of them subsequently voted for Duhalde, as did the rightist Agrarians. The election on Sept. 4 gave González a plurality of about 48,000; of the 471,890 votes cast, he received 189,606 to 141,505 for the second highest candidate, Cruz Coke. The Liberal, Fernando Alessandri, won 128,721, and Bernardo Ibáñez, running with some Socialist support, got 11,922. As no candidate thus received a popular majority, the election was constitutionally thrown into the vote of the congress, scheduled to meet Oct. 24. Duhalde resigned the presidency Oct. 17 and was succeeded by Interior Minister Juan A. Iribarren. The congressional election gave the presidency to González by a vote of 138 to 46. In naming his cabinet on Oct. 31 he included three Communists.

Chile, on Dec. 14, reaffirmed a claim to antarctic territory between 53° and 90° W. longitude.

Education.—Schools enrolled in 1946 close to 600,000 pupils.

A 1943 estimate of the literacy rate was 76%, third highest of all Latin American states. The University of Concepción announced plans in 1946 to build a new medical school.

Finance.—The monetary unit is the peso, valued in Nov. 1946 at from 2.55 to 5.16 cents, U.S. The revised 1946 budget put revenue estimates at 5,882,900,000 pesos and expenditures at 5,878,300,000 pesos. The 1945 budget was balanced at 4,749,000,000 pesos but actual expenditures were 5,741,000,000 pesos as against revenues of 5,531,000,000, leaving a 1945 deficit of 210,000,000 pesos. However, previously accumulated budget deficits were reduced in 1945 by 81,000,000 pesos through bond sales. The treasury cash overdraft Jan. 1, 1946, was 586,800,000 pesos. The internal direct funded debt on the same date was 3,866,000,000 pesos, an increase of 774,000,000 pesos in one year. Foreign bond retirements in 1945 included \$6,479,500, £227,989 and 15,000 Swiss francs. The government on Mar. 8, 1946, announced its intention to resume full service on the foreign debt. Paper currency in circulation Jan. 1, 1946, was 3,506,600,000 pesos. The Central bank on May 21 had sight liabilities of 3,800,000,000 pesos (of which 2,900,000,000 represented currency in circulation); gold and foreign-exchange holdings at the same time were \$95,000,000 but these had decreased by Nov. 5 to \$76,800,000. The government early in 1946 announced plans to spend 500,000,000 pesos during the year under its 6-yr. public works program, plus 300,000,000 pesos on other works not included in the special program. The government's low-cost housing bureau planned to spend 265,000,000 pesos in 24 provinces during 1946 for erection of 4,595 dwellings. The official cost-of-living index at the beginning of 1946 was 445 as against 100 in March 1928.

Trade and Communication.—Chilean exports to the United States in 1945 were valued at \$137,100,000 (1944: \$153,600,000); imports from the United States were valued at \$51,300,000 (1944: \$51,400,000). World sales of Chilean nitrate in 1944-45 were 1,436,282 metric tons (1943-44: 1,050,555 tons). Barley exports in 1945 were 20,635.6 metric tons (1944: 18,846.5 tons). Oats exports in 1945 were 8,614.9 metric tons valued at \$592,349 (1944: 5,715.9 tons valued at \$331,621). Exports of wheat in 1945 were 1,170 metric tons, almost all of it to Bolivia, valued at \$146,733 (1944: 1,305 tons valued at \$166,483). Deciduous fruit exports in 1945 were 3,864 metric tons valued at \$553,600 (1944: 3,759 tons valued at \$521,100). Export of all types of copper in 1945 was 470,642 metric tons; all mineral exports, except nitrates, totalled 829,214 metric tons (1944: 573,618 tons). Grain exports in the first 3 mo. of 1946 were 6,195 metric tons valued at \$927,440 (same period in 1945—4,730 tons valued at \$482,196); the grains included 72.1% malting barley and 26.3% oats. Late in 1946 Chile bought 50,000 metric tons of sugar each from the Dominican Republic and Peru. Chile's 1936 commercial agreement with Ecuador was on Oct. 18 changed to an unconditional and unlimited most-favoured-nation agreement. During 1946 Chile concluded a large-scale agreement with Cuba for exchange of nitrates for sugar. A trade agreement was concluded with Peru. The United States and Great Britain concluded special contracts for purchase of electrolytic copper, the former for 100,000 long tons at 11.875 cents a pound and Great Britain for 35,000 tons.

Railway mileage was 5,434, highway mileage more than 28,000. A comprehensive program to improve Chile's railroads was put forward late in 1946; it contemplated expenditures of about \$60,000,000 and 800,000,000 pesos. The state railways lost 150,000,000 pesos during 1945 and in consequence raised freight rates in 1946 by an average of 18%, first- and second-class passenger fares by 10% and third-class fares by 20%. Reciprocal air service authorizations were concluded with the Brazilian Cruzeiro do Sul line, the Argentine FAMA (Flota Aérea

Mercante Argentina) and Lloyd Aéreo Boliviano; Air France and British South American airways were authorized to fly to Santiago. Plane service from New York city in 40 hr. began Nov. 17.

Agriculture.—Estimates of various crops for the 1945-46 season were: wheat 8,806,485 metric quintals (metric quintal = 220.46 lb.) (1944-45, 9,091,317 metric quintals); sunflower seed 16,692 metric tons (decrease of 40.5% from 1944-45); flax fibre 1,365 metric tons (decrease of 1%); flaxseed 3,837 metric tons (increase of 10.1%); hemp fibre 5,369 metric tons (decrease of 11.3%); hempseed 4,904 metric tons (increase of 1.1%); onions 49,134 metric tons; garlic 8,402 metric tons; barley 722,310 metric quintals (1944-45, 801,310 metric quintals); oats 801,306 metric quintals (1944-45, 1,021,990 metric quintals); rice 117,941 metric tons (record production). The 1945-46 citrus fruit crop was expected to be a record; deciduous fruits also had bright prospects. Cattle population in 1944 was estimated at 2,305,713; the estimated 1946 slaughter was 590,576.

The government drew plans in 1946 for a special fund of 500,000,000 pesos to finance the settlement of 50,000 to 100,000 European families in southern Chile.

Manufactures.—An important Chilean steel industry appeared in the making in 1946. The Fomento corporation in April established the Compañía de Acero del Pacífico with \$15,000,000 of domestic capital; earlier Export-Import bank loans and other credits raised its resources to \$53,000,000. It was expected to be in operation by 1949 with an annual capacity of 180,000 tons of pig iron and 200,000 tons of finished products. A governmental decree of Feb. 20 provided for creation of national producers' corporations to cartelize industry; they were to consider such matters as nationalization, improvement of quality of production, changes in capitalization, distribution of labour supply, sales and export, standardization, acquisition of raw materials and machinery, etc.

Copper production in 1945 was 488,000 metric tons (1944: 500,000 tons). Nitrate production in 1945 was 1,196,576 gross tons. An oil well was brought in in Tierra del Fuego Dec. 29, 1945, with an estimated daily capacity of 6,000 bbl. Whale-oil production in 1945 was 3,456 metric tons from 477 whales.

China. China, a republic of eastern Asia. Area, about 3,858,900 sq.mi., divided into 35 provinces, including Taiwan (Formosa), the 9 provinces of Manchuria and a special terri-

"NO REST FOR THE WEARY" was the title of this cartoon drawn in 1946 by Crawford of the *Newark Evening News*

the Political Consultation conference, the government and the communists finally concluded an armistice agreement. With the general cease-fire order effective on Jan. 13 and U.S. assistance in implementing the cease-fire order through the offices of the executive headquarters, the Political Consultation conference, which consisted of eight representatives of the Kuomintang, seven communist delegates, nine delegates of the Democratic league, five delegates of the Youth party and nine representing nonpartisan groups, reached the following major agreements on Jan. 31: (1) reorganization of the government and broadening of its representation; (2) convocation of a national assembly on May 5 to adopt a constitution; (3) principles for political, economic and social reforms; (4) unification of military command. With Gen. Marshall as the mediator an agreement on military reorganization and for the integration of the communist forces into the national army was signed on Feb. 25 which provided that 12 months after the coming into force of this agree-

ment China's army should consist of only 108 divisions (90 government and 18 communist) under a ministry of national defense. Before these agreements were put into practice, fighting between the government and communist troops spread in Manchuria following the withdrawal of the soviet troops from Mukden on March 11, Changchun on April 16, Harbin on April 26 and Tsitsihar on April 28. The government troops entered Mukden on March 12, and the communists occupied all the northern Manchurian cities immediately after the soviet withdrawal. After the government troops took Changchun, known as the capital of Manchuria, May 23, a 15 days' truce (June 6-22) in Manchuria was declared. However, fighting was intensified during the summer in Jehol, gateway to Manchuria, northern Kiangsu, northeastern Hopeh and southeastern Shantung. The effort of Gen. Marshall and John Leighton Stuart, the newly appointed U.S. ambassador, to bring the two sides together by creating a committee of five on Aug. 29 headed by Amb. Stuart to discuss a coalition government was fruitless as neither the government nor the communists were willing to give up their military gains. In the latter part of September, the government troops attacked Kalgan, the major communist base, and Chou En-lai, chief communist negotiator, quit the peace negotiations. On Oct. 11 Kalgan fell to the government and on Oct. 21 Chou was persuaded to return to Nanking for further negotiation. Five days after the opening of the national assembly on Nov. 15, Chou flew from Nanking to Yen-an. On Dec. 4 Chou wired Gen. Marshall from Yen-an that "if the Kuomintang would immediately dissolve the illegal National Assembly now in session, and restore the troop positions of January 13, the negotiations between the two parties may still make a fresh start."

To induce the communists and the third parties to join the assembly, Chiang issued a qualified cease-fire order on Nov. 11 and postponed the opening of the national assembly from Nov. 12 to 15. On Christmas day the national assembly without the communists and the left wing of the Democratic league adopted a new constitution combining the important features of a presidential and parliamentary system of government with Sun Yat-sen's Five Power Constitutional Democracy to be put into effect on Dec. 25, 1947. Until the new constitution was put into force and the new president elected, the Kuomintang would continue to be the ruling party.

The government and communist rivalry reflected the differ-

CHINESE with a varied assortment of wares to sell, in a black market trading section in Mukden, Manchuria, during 1946. Because of inflated prices there were few customers except those with items to barter

ence between the U.S. and soviet policies in China. The soviet troops remained in Manchuria after Feb. 1, the agreed date for complete withdrawal of soviet troops. On Feb. 26 the soviet supreme military command in Manchuria stated that soviet forces would complete evacuation before the date of departure of the U.S. troops from China. In the meantime Washington, D.C., sent Chungking and Moscow an identical note for information on the Sino-soviet talk on Manchuria and on Feb. 26 Secy. James F. Byrnes denied any knowledge of a Big Three agreement authorizing the soviet removal of machinery from Manchuria, the direct damage of which was estimated at \$858,000,000 by Edwin Pauley, U.S. reparations representative. In March China rejected the soviet claim to all enterprises in Manchuria that had served the Japanese Kwantung army. In April the soviet government agreed to have all troops out of Manchuria by the end of April while the U.S. army decided to disband its forces in the China theatre on May 1. On Aug. 31 China and the U.S. concluded an agreement which enabled China to get about \$800,000,000 of wartime U.S. properties in China and the west Pacific. It was revealed that from V-J day to Sept. 30 China received about \$1,000,000,000 of lend-lease materials from the U.S. On Dec. 18 Pres. Truman reiterated the U.S. policy toward China as stated on Dec. 15, 1945, namely: recognition of Chiang's government as legitimate, cessation of civil war and broadening of the national government as a condition to U.S. economic aid.

Other important diplomatic developments included: the formal recognition of the independence of Outer Mongolia on Jan. 5; the conclusion of the Sino-French treaty on Feb. 28, similar to the Sino-American and British treaties of 1943; the signing of a Sino-Canadian commercial pact on Sept. 27, providing for the reciprocal exchange of unconditional most-favoured-nation treatment; and the signing of a new five-year Sino-American treaty of friendship, commerce and navigation on Nov. 4, based on principles of reciprocity and most-favoured-nation treatment.

Education.—The 1946 program of cultural rehabilitation was: to restore those schools which moved to the interior during the war; to re-establish those schools which closed because of the war; to establish new schools. The educational expenditures for 1946 amounted to approximately 5% of the national budget. There were about 145 institutions of higher learning

CHINESE SOLDIERS of the Communist fourth army in Hopeh province reading a sign painted in English and Chinese urging the strengthening of Sino-American friendship in 1946 and expressing the hope that Gen. George C. Marshall would end the civil war

with an enrolment of 78,000, almost double the prewar figure. In July 1945 there were in Free China 3,455 secondary schools with an enrolment of 1,101,087 and 265,417 primary schools with 18,000,000 pupils.

Defense.—The program of reorganization and demobilization of the army was interrupted by civil war. The national army consisted of about 250 divisions, totalling approximately 3,000,000 men. The communist force was increased to about 1,500,000 men. With the donation by the U.S. of small warships China's war vessels numbered about 60 with an aggregate tonnage of 38,000 and with 25,000 navy personnel. China's small air force consisted of a few hundred planes. The three military branches were under the direction of the ministry of defense. About 80% of the budget was devoted to military purposes.

Trade and Communication.—The 1946 unfavourable balance of trade was unprecedented. From January to September imports (exclusive of United Nations Relief and Rehabilitation administration goods) through Shanghai were valued at Ch. \$781,855,000,000 while exports totalled only Ch. \$161,763,000,000. To encourage export and preserve foreign exchange the maritime customs in July prohibited the import of textile goods, animal products and other nonessential goods, and restricted the import of food and motorcars. In November the licensing system was applied to all imports.

Excluding railways in Formosa, the railway mileage totalled more than 12,000 mi., about half in Manchuria and about 3,500 in north China. More than one-third of the latter were wrecked or wholly inoperative because of the communists. Purchases in 1946 increased China's shipping tonnage to 1,500,000 tons. China had about 100,000 mi. of highway, 30,000 of which were damaged as a result of the war. China's civil aviation and telecommunication remained insignificant in proportion to its population.

Finance.—The value of the Chinese dollar (yuan) constantly depreciated. On March 4 the official rate of exchange was fixed at \$1 U.S. to Ch. \$2,020 and on Aug. 18 it was \$1 U.S. to Ch. \$3,350. At the year's end the black market rate of exchange was \$1 U.S. to Ch. \$5,000–7,000. In the big cities the general price index was about 4,000 times the prewar level. At the end of 1945 the volume of note issuance was more than Ch. \$1,000,000,000,000, and the monthly rate of note issue in 1946 numbered in the billions. The minister of finance announced in March the national budget of 1946 as Ch. \$2,524,900,000,000 and the deficit as Ch. \$677,100,000,000. The actual expenditures and deficit were still greater. China's wartime loans totalled \$1,345,080,568. To Sept. 30, 1946, U.S. lend-lease to China totalled \$1,564,698,000. In March the U.S. Export-Import bank granted China \$33,000,000 credit for cotton purchases.

According to the new banking regulations promulgated on April 17 only county banks were allowed to be established. There were nearly 600 banks with more than 2,350 branch offices.

Agriculture, Manufactures, Mineral Production.—Because of war and agricultural backwardness China faced a serious food shortage in 1946 and there was mass starvation. The general industrial production also decreased sharply and many industries were on the verge of total collapse. The peak annual production of important minerals before or during the war were: coal—Manchuria 30,000,000; North China, 30,000; and Free China 6,000,000 tons; steel—Manchuria and North China 3,000,000 and Free China 10,000 tons; tungsten ore—13,000 tons; tin—11,000 tons and antimony—13,000 tons. Removal of equipment by the U.S.S.R. in Manchuria greatly reduced the coal and steel production.

Chou En-Lai (1898–), Chinese Communist army officer, was born in Huaiyin, Kiangsu province. He attended Waseda university in Japan and Nankai university in Tientsin. In 1919 he led a student rebellion which resulted in his arrest and imprisonment. He subsequently went to Paris where he founded a Communist group among Chinese students. On his return to China in 1924 he joined Sun Yat-sen's movement and was made director of political training at Whampoa Military academy of which Chiang Kai-shek was president.

Chou managed to escape a death sentence during the anti-red drive of 1927 and intensified his activity with Chinese communist movements. After the Japanese attack on China in July 1937, Chou called on Chiang to bury political differences and establish a united front with the Communists against Japan. Chiang accepted the proposals, and Chou became Yen-an's liaison officer, at Chungking. The Nationalist-Communist truce was not durable and the number of incidents between the two armies increased dangerously by 1944.

Chiang, Chou and Gen. George Marshall, President Truman's personal representative, arranged a truce, disclosed Jan. 10, 1946, but it was of short duration as were the successive truces during 1946. On Sept. 19 Chou quit the Nanking peace negotiations, charging that Chiang and the U.S. were basing their policies in China on the assumption of war with the soviet union. He later resumed the consultations.

Christian X (1870–), king of Denmark, of whom a biographical account will be found in *Encyclopædia Britannica*. Nephew of Queen Alexandra of Great Britain, he succeeded his father, Frederick VIII, in 1912. King Christian became increasingly popular with the passing years and kept in close contact with his people.

During the early years of World War II, even after the German invasion of Denmark, the king kept an autonomous Danish administration. From Aug. 1943 until the end of the war he was a virtual prisoner at his castles of Sorgenfri or Amalienborg. Throughout the struggle he personified the independent spirit of his people, and naturally became the central figure in the period of liberation. His birthdays—the 76th was celebrated on Sept. 26, 1946—were occasions for popular expression of loyalty to him and of national unity. The year 1946 was happily one of no great crisis for either monarch or people. (See also DENMARK) (F. D. S.)

Christian Science. The need for Christian Science wartime ministers whose work was supervised by the Christian Science Camp Welfare committee, did not end with the cessation of hostilities in World War II, although such need gradually diminished. In the autumn of 1946, the postwar activities of the committee consisted mainly in supplying Christian Science workers for 135 Veterans' Administration hospitals in the United States and Canada and serving military and naval personnel at training camps in the United States, as well as occupation troops in the European and Pacific theatres. The activities also consisted of rehabilitation work and the collection and sending of food packages to famine-stricken countries abroad.

The Christian Science Monitor continued to maintain its

large staff of correspondents, and in 1946 returned its correspondents to Rome and Moscow. *The Monitor* pioneered in the newspaper world by allowing its readers to start and finish a newstory on page one.

The Christian Science Monitor resumed its "Monitor Views the News" broadcast on a coast-to-coast hook-up of the American Broadcasting company system. *The Monitor's* distinguished editor serves as commentator. Under his editorship this newspaper won special awards for typography, editorial policy and its uniquely thorough coverage of international news. The head of the Washington, D.C., news bureau of *The Christian Science Monitor* received the George Arents medal for proficiency in journalism in ceremonies held at Syracuse (N.Y.) university.

The natural science editor of *The Monitor* was made president of the National Association of Science Writers. He was awarded a medal and citation at a meeting of the American Association for the Advancement of Natural Science. This award was made through the George Westinghouse Science Writers fund.

The Christian Science Publishing society added the Spanish edition of the *Herald of Christian Science* to the other *Heralds* already being published in French, German, Dutch, Scandinavian and Braille. The publishing society also issued many other authorized publications, the latest of which were *Twelve Years with Mary Baker Eddy* by Irving C. Tomlinson, and *Mary Baker Eddy: Her Mission and Triumph* by Julia Michael Johnston.

Early in 1946 a new edition of the Christian Science textbook, *Science and Health with Key to the Scriptures* by Mary Baker Eddy, especially suitable for sale in book stores, was issued.

A *Christian Science Talking Book* presenting the preface and first chapter of the Christian Science textbook was published by the trustees under the will of Mary Baker Eddy. The *Talking Book* is for the exclusive use of those who, because of blindness or impaired vision, are unable to read ink print.

Transcribed programs prepared in the Mother Church were broadcast over approximately 200 stations in the United States, its possessions and Canada. Australia and New Zealand were also beginning to use them. In co-operation with the Columbia Broadcasting system, the Mother Church continued its periodic broadcasts of Sunday "Columbia Church of the Air" programs.

(W. D. K.)

Christian Unity. The first postwar year of relatively free travel and intercommunication afforded numerous occasions and activities for restoring the broken contacts of the churches, as well as continuous advance in the direction of unity. Co-operative organization of the churches in the United States reached an all-time high peak. One hundred forty-seven local councils of churches were reported under paid professional leadership, and 354 under voluntary leadership, in addition to which about 1,600 ministerial associations were carrying on co-operative activities similar to those of formally organized councils. The movement for the first time began to make provision for special professional training of future leaders through the establishment of eight oecumenical fellowships financed by the Rosenwald fund. Favourable action by a majority of agencies concerned and by leading denominations was reported on the movement to merge the eight major U.S. interchurch agencies into the National Council of Churches.

Co-operative unity on a world scale was high-lighted by meetings in February and August of the provisional committee of the World Council of Churches, which had been in process of formation from 1937. The committee of arrangements, headed by Dr. Samuel M. Cavert of the Federal Council of Churches of Christ in America, reported plans for holding the first assembly

of the world council in Holland in 1948. The assembly was expected to set the work of the council in full motion.

Actual mergers of denominations were represented in the United States by the union of the United Brethren and Evangelical Churches (both bodies of German origin and Methodist type) into one body of about 750,000 members. The United Church of Canada absorbed the small Evangelical denomination in Canada. Conferences between Disciples and Baptists were continued. Negotiations for organic union were opened between the Reformed Church in the U.S. and the United Presbyterian Church. Stimulated by strong prodding from their laity, the proposal for the union of the Congregational Christian and Evangelical and Reformed denominations was pressed to the point of considering detailed adjustments by the boards and agencies, and had every promise of early consummation. Similar lay insistence led to accelerated negotiations by the Presbyterian Church in the U.S.A. and the Presbyterian Church in the U.S. (Southern). The Congregational, Methodist and Presbyterian Churches in Australia reached a new stage in negotiations in the promulgation of a scheme of federal union.

Negotiations for union between churches which feel that they are divided on basic issues went forward with varying success. Long-continued official discussion between the Protestant Episcopal Church and the Presbyterian Church in the U.S.A. apparently reached a temporary deadlock in the rejection of the report of its own negotiators by the Protestant Episcopal General convention and the substitution of a resolution expressing readiness for "organic federation" with any other churches in fundamental doctrine agreement, for the full "organic union" which had hitherto been proposed to the Presbyterians. The Presbyterian General Assembly replied by authorizing continued negotiations on the former terms. In Canada, on the contrary, discussions between the Church of England in Canada and the United Church of Canada entered upon a hopeful phase. The Canadian proposal for achieving church union is that each church convey authority to the ministers of the other, through a formal ordination.

The Scheme of Union for South India, previously approved by the Methodist Church (British in origin) and the Church of India, Burma and Ceylon (Anglican), was finally approved by the assembly of the United Church of South India. This action apparently assured the consummation of a union within one church of eight previously separate denominations, originating in missions conducted by five nations, with communicant membership of about 267,000, representing a Christian community of well over 1,000,000.

The year's most significant general discussion of Christian unity was that initiated by the Archbishop of Canterbury in addresses during his U.S. tour, followed by an address to the Free Church Council in England and a subsequent sermon at Cambridge university. The Archbishop advocated an approach to unity which develops an exchange of life, in worship and sacraments, between churches before attempting constitutional changes. Free Church discussion has treated the proposal sympathetically but with caution. In the U.S. the Rt. Rev. Angus Dun, bishop of Washington, inaugurated the recently established Hoover lectureship on Christian unity, by a series of lectures at the University of Chicago on "The Church as Body and Spirit." The most noteworthy publication of the year in the field of Christian unity was *The Interseminary Series*, five volumes of discussions by leading U.S. religious thinkers on interchurch relations.

(H. P. D.)

Chromite. As is indicated in Table I, world production of chromite expanded by about one-half under war demand, reaching a high of 2,210,000 tons in 1942, with moder-

ate decline in 1943. While data were incomplete for 1944 and 1945, with figures at hand for all major producers but the U.S.S.R., it was evident during 1946 that a reversion was under-way to about the prewar level, or possibly lower.

Table I.—*World Production of Chromite*

(Thousands of short tons)

	1939	1940	1941	1942	1943	1944	1945
Cuba	65.6	57.7	179.9	315.8	390.4	211.8	190.3
Greece	62.9	62.8	?	44	16	?	?
India	55.0	62.2	56.1	55.5	37.2	?	?
New Caledonia	57.3	61.5	71.1	74.6	51.8	60.9	45.0
Philippines	139.7	214.3	330	55	66	?	?
South Africa	176.4	180.4	156.4	372.2	179.9	98.0	85
S. Rhodesia	153.3	273.1	357.1	384.0	316.9	305.4	205.4
Turkey	211.3	187.2	165.7	159.5	217.0	203.5	?
U.S.S.R.	?	?	?	440	358	?	?
United States	4.0	3.0	14.3	112.9	160.1	45.6	14.0
Yugoslavia	65.6	78.3	?	110	72	?	?
Total	1,300	1,633	2,055	2,210	1,972	?	?

Note.—Figures without a decimal are estimates.

Production in Greece, Yugoslavia and the Philippines, all of which had been in enemy hands, was expected to take some time to recover. Cuba, Rhodesia, South Africa, the U.S.S.R. and Turkey had to carry the main load in the war expansion, and consequently faced the heaviest cuts as outputs were scaled down to normal demands. Particularly interesting developments were foreseen in Russia, where extensive exports had been made, following a period of years in which the output was consumed entirely at home. Prospects for continued high production in Cuba were to a considerable extent dependent on the renewal of activities in the Philippines, as in both cases refractory grades make up the bulk of the output. And finally the direction of the whole postwar trend in production depended on the rate at which industry would develop new and expand established uses for chromium.

United States.—For comparison, the supply and demand for chromite in the United States during World Wars I and II are shown in Table II.

Table II.—*Chromite Data for the United States for the periods of World Wars I and II*

(Thousands of short tons)

	Pro- duction	Im- ports	Sup- ply		Pro- duction	Im- ports	Sup- ply	Con- sumption
1914	0.7	83.7	84.4	1939	3.9	355.6	359.9	?
1915	3.7	85.7	89.4	1940	3.0	736.6	739.6	562.9
1916	52.6	129.9	182.5	1941	14.3	1,115.3	1,129.6	800.3
1917	49.0	80.9	129.9	1942	112.9	981.6	1,094.5	892.0
1918	92.4	112.2	204.6	1943	160.1	928.6	1,088.7	944.6
1919	5.7	68.9	74.6	1944	45.6	848.4	894.0	848.4
1920	2.8	168.3	171.1	1945	14.0	914.8	928.8	808.1

In addition to revealing the extent to which the United States was dependent on foreign sources of supply, these figures emphasize the extent to which developments during the interwar period expanded the overall demand. Viewing the records merely from the standpoint of tonnage produced, the 1939-45 record was much better than that of 1914-20, but in comparison with current demand, and with the effort and cost to secure the results, the relative showing was much poorer. Furthermore, much of the 1939-45 output was too low in grade to be salable even under war conditions, and in 1946 still remained in stockpiles.

It has now been effectively demonstrated on two different occasions that only under war demand could the domestic reserves yield an appreciable output, at best only a fraction of the total required, and that of lower grade than industry normally requires. The availability of foreign supplies is therefore a matter of prime importance. This situation is emphasized all the more strongly by the fact that Cuba is the only important producer in the western hemisphere, and all other supplies are subject to long overseas transportation, with all of the hazards which that involves. The sources from which these supplies were obtained during World War II are shown in Table III.

Table III.—*Imports of Chromite into the United States*

(Thousands of short tons)

	1939	1940	1941	1942	1943	1944	1945
Cuba	73.9	58.2	179.9	137.8	310.7	349.1	297.8
Greece	12.2	15.7	2.2
U.S.S.R.	30.1	99.9	112.3	166.1
India	18.4	36.6	10.9	21.3	2.8
Philippines	80.5	175.4	288.4	30.5
Turkey	18.6	78.5	61.8	119.5	90.8	98.8	70.8
South Africa	71.6	126.3	189.7	262.3	111.6	40.4	110.4
S. Rhodesia	54.6	177.9	269.2	277.3	243.5	187.8	221.9
New Caledonia	16.1	48.0	90.2	82.7	32.5	34.5	34.5
Total	355.6	736.6	1,115.3	981.6	928.6	848.4	914.8

Inspection of these figures discloses the extent to which the war program rested on maintenance of foreign supplies, and the shifts from one source of supply to another as shipping conditions or the progress of the war affected various producers.

The successful maintenance of an adequate war supply in spite of all of the difficulties encountered is evidenced by a comparison of the supply and consumption columns for the years 1940 to 1945 in Table II. Each year shows a comfortable margin of surplus over consumption, which was stockpiled for future use in case of interruption of imports. At the end of 1945 the Metals Reserve company had 866,333 tons of chromite in storage in the United States, 492,587 tons stored in foreign ports and 61,550 tons afloat, enroute to the United States, a total of 1,420,470 tons. Even though this record must be discounted to some extent, as about one-third of the ore stored in the United States was of domestic production, much of which was too low in grade to be readily usable, it still stands as a monument to a tremendous effort, made necessary by a lack of domestic chromite resources.

The stocks accumulated during the war years were presumably to be turned over to the permanent stockpile, to be supplemented by future purchases until the amount should reach the total recommended by the Army and Navy Munitions Board.

(G. A. Ro.)

Chronology: see CALENDAR OF EVENTS, 1946, pages 1-16.

Churches, World Council of: see CHRISTIAN UNITY.

Churchill, Winston Leonard Spencer (1874-), British statesman, was born at Blenheim palace, Oxfordshire, England, on Nov. 30, the elder son of Lord Randolph Churchill and Jennie, daughter of Leonard Jerome of New York city. For his biography and his political career during World Wars I and II, see *Encyclopædia Britannica*.

With the end of World War II, Churchill gave expression to his distrust of soviet policies. His attitude was reflected in his address (March 5, 1946) at Westminster college in Fulton, Mo., where he appealed for an Anglo-U.S. "fraternal association" to halt the "expansive and proselytizing tendencies" of the soviet union. In a subsequent speech in New York city (March 15), Churchill again called for an Anglo-U.S. "fraternal association" but denied that he ever sought a military alliance and added that he did not believe that the soviet leaders wanted a war "at the present time." Both speeches created an international furor. President Harry S. Truman, who was present at the Fulton speech, subsequently hastened to deny that his attendance meant endorsement of Churchill's views. The Labourite government also dissociated itself from Churchill's statements and Stalin later denounced his former wartime ally as a "war-monger."

While Churchill disapproved what he termed the Labour government's policy with regard to India, Burma, Egypt and Palestine and denounced its efforts to "liquidate" the empire, he largely endorsed its foreign policy and on Oct. 5, 1946, praised the Attlee government "for having decisively broken with communism."

Church Membership. The latest information about church membership in the 55 religious bodies, each reporting more than 50,000 members, was that published by the *Christian Herald* in June 1946 (see table). The total given for continental U.S. was 71,700,142 persons, mainly for years ending in 1945, compared with 70,623,989, as reported by the same bodies for the *Yearbook of American Churches*, compiled under the auspices of the Federal Council of the Churches of Christ in America, published in July 1945, mainly for years ending in 1944. Some bodies do not publish annual figures, and in a few instances the latest data are for the year 1936, the date of the last census of religious bodies as taken by the federal bureau of the census. According to the official reports of the statisticians of the religious bodies, total church membership had been increasing for some years. The

church membership figures published in 1945 and 1946 represented the largest proportion of the total population ever reported in the religious bodies.

The 55 religious bodies having more than 50,000 members had 97.4% of all the church members in continental U.S., according to the complete report published in 1945. The remaining 2.6% of the members were in the 201 smaller bodies. Of the total reported church membership in 1945, 32.3% was Roman Catholic; 1.3% Old Catholic, Polish Catholic and Eastern Orthodox; 6.4% Jewish and 60% Protestant. In 1945 there were reported by 256 religious bodies 72,492,669 members, of whom 59,717,181 were 13 years of age and over. The total number of church members in 1945 was 52.5% of the estimated population.

*Not reported

Church of England. An important event in the first post-war year was the revival of ecclesiastical legislation. The Benefices (Suspension of Presentation) measure, the Curates' Grants measure and the Clergy (Supplementary Pensions) measure all received the royal assent in 1946. In the Church assembly the Church commissioners for England measure for the amalgamation of the Ecclesiastical commission and Queen Anne's Bounty, the Bishops' Retirement measure and the Parsonage (Amendment) measure received final approval. The Church Dignitaries' Retirement measure, dealing with deans, provosts, archdeacons and canons, received general approval. The Clergy (national emergency precautions) act came to an end on Nov. 15. A new commission was appointed to report on the revenues of parish church cathedrals, and another to report on the care of church people in mental homes and hospitals and on the training of chaplains for these institutions. One report stated that 925 candidates, including ex-servicemen, had been accepted for the ministry, and another stressed the need for instruction in public worship and for dogmatic rather than ethical preaching. The assembly voted £50,000 toward the expansion of training colleges for teachers, and Lord Selborne outlined a scheme for the co-ordination of religious education in all its aspects by five departmental councils. Parliament agreed that under the Education act (1944) children in elementary, aided and "special agreement" schools might attend church services on special as well as regular occasions.

The convocations of Canterbury and York approved the revised Canon 99 on "Impediments to Matrimony" and accepted a new table of kindred and affinity. Several new appeals were made, including the bishop of London's appeal for £750,000 for churches and schools and those of the archbishops for £600,000 for training ex-servicemen for the ministry and for £300,000 for Canterbury cathedral. The diocese of London produced the first scheme under the Reorganization measure (1941): 83 parishes were to be amalgamated and 79 sites to be sold for church-building in new housing areas. The work of the Church of England Men's society was revived.

The Rt. Rev. A. F. Winnington Ingram (bishop of London, 1901-39) died on May 26 and Dr. J. K. Mozley, one of the leading Anglican theologians and formerly canon of St. Paul's, on Nov. 23.

Civil Aeronautics Administration. All phases of civil aviation showed growth beyond predictions in 1946. The tremendous spurt in personal flying and flight training is reflected in the fact that the number of registered aircraft more than doubled, from 37,789 at the end of 1945 to 85,000 at the end of 1946, and the number of certificated pilots (private, commercial and transport) increased from 296,895 to 400,000. Student pilot certificates issued during 1946 numbered 170,000, as against 77,188 in 1945.

Primarily to meet the demands for small planes, civil aircraft production jumped from 2,047 planes in 1945 to 35,000 in 1946. Surplus military aircraft accounted for the balance of the increase in registrations.

Air lines carried a total of 13,819,000 passengers—almost double the 1945 figure. Air-line traffic measured in passenger miles amounted to 7,258,000,000. This represents an increase of 6,000,000,000 passenger miles over 1940. Passengers flying on international routes of U.S. flag carriers passed the 1,000,000 mark for the first time, increasing from 492,792 in 1945 to 1,040,000 in 1946.

This tremendous volume in air-line operations was accomplished with significant improvement in the safety record. Passenger fatalities per 100,000,000 passenger miles flown on domestic and international routes were reduced from 2.31 in 1945 to 1.47 in 1946.

Thousands of new businesses sprang up in the field of non-scheduled passenger and cargo service. The CAA received requests from 3,061 such services for operating certificates under the new regulations governing them.

Keeping pace with this upsurge, the CAA broadened considerably the scope of its activities. In the international field, CAA technicians took a leading role in U.S. participation in P.I.C.A.O. (Provisional International Civil Aviation organization) regional route services conferences at Dublin (North Atlantic area), Paris (European-Mediterranean), Washington (Caribbean) and Cairo (middle east). Another important CAA-P.I.C.A.O. project was a three-week demonstration at Indianapolis, Ind., to world technicians of U.S. radio aids to air navigation, which then were generally adopted at a meeting in Montreal as the basis for international standards.

To perform its safety regulation duties on the expanding routes of U.S. air carriers, CAA opened offices in Paris, London, Cairo, Mexico City and Sydney, Australia. Technical missions were sent to Turkey, Colombia, Peru, Venezuela, Chile, Mexico and Brazil, and an engineer was sent to the Philippines to pave the way for airways construction under the Philippine Rehabilitation act. In addition, CAA personnel were assigned to operate surplus navy airways facilities at Paris, Dakar and the Azores under an executive order providing for the operation by the CAA of such facilities essential to civil flying until nationals of the countries concerned could be trained to staff them. Certain surplus army facilities in Alaska also were transferred to the CAA for operation.

On the domestic scene, initial steps were taken under the \$500,000,000 National Airport act, including completion of regulations, formulation of a three-year National Airport plan and approval of project applications for the first year's program.

To cope with increasing airways traffic, new devices were readied for operation. Three modified G.C.A. (ground-controlled approach) radar sets were being installed for experimental use during the winter of 1946-47 in the New York, Chicago and Washington airport traffic control towers. Instrument landing systems were installed by CAA at approximately 50 airports as the air lines completed installation of corresponding airborne receiving equipment and pilot training in its use. A very high frequency airway was placed in operation between Las Vegas

and Denver, first stage in the eventual conversion of the entire 40,000 miles of airways to V.H.F. Developmental work continued at the CAA experimental station in Indianapolis on many other radio and radar improvements. (See also AIRPORTS AND FLYING FIELDS; AVIATION, CIVIL.) (T. P. W.)

Civilian Production Administration.

The Civilian Production administration, established as successor to the War Production board by executive order 9638 of the president of the United States, began operations on Nov. 3, 1945. John D. Small was named administrator.

Instructions from President Truman were that CPA's functions and powers, transferred to it from the WPB, "be utilized to further a swift and orderly transition from wartime production to a maximum peacetime production in industry free from wartime government controls, with due regard for the stability of prices and costs, and to that end shall be utilized to: (a) expand the production of materials which are in short supply, (b) limit the manufacture of products for which materials or facilities are insufficient, (c) control the accumulation of inventories so as to avoid speculative hoarding and unbalanced distribution which would curtail total production, (d) grant priority assistance to break bottlenecks which would impede the reconversion process, (e) facilitate the fulfillment of relief and other essential export programs, and (f) allocate scarce materials and facilities necessary for the production of low-priced items essential to the continued success of the stabilization program of the Federal Government."

Handed down from the WPB along with its priorities and allocations powers was a faith in the laissez-faire principle for peacetime industry. This was in keeping with the general thinking of the administration—that a return to peacetime full production and full employment could be achieved most rapidly with a minimum of government control. The policies CPA followed, therefore, called for assisting industry to attain its production goals at points where the over-all progress of reconversion was threatened, but without detailed planning and directing by government of the various processes of industrial reconversion.

Wherever possible, the agency preferred to exercise its influence with industry informally through contacts of CPA executives and through the meetings of industry advisory committees. The formal controls which the agency employed chiefly regulated the use and distribution of some specific materials whose scarcity limited the expansion of the entire economy. Many controls were grouped around a few key civilian programs on which CPA concentrated: housing for veterans, production of low-cost clothing, breaking of industrial bottlenecks, relief for individual hardship, aid for small business, limitation of exports and inventories of goods in short supply domestically.

The physical reconversion of plants to civilian goods was accomplished rapidly. But certain shortages persisted: not in most cases because of low production, but because the high rates of production that were quickly attained for components and materials were inadequate to support the even higher schedules for production of end-goods. Despite the fact that the production of basic materials in Oct. 1946, was almost the same as at the wartime peak in 1943, the unprecedented producer requirements for materials, equipment and new facilities could not be met.

While for some products there was not enough industrial capacity, in the cases of others, there was a lack of natural resources, either domestically or internationally. In a period of clamorous and conflicting demands, these conditions called for government measures to assure supplies for the most essential

needs. In addition to orders affecting certain specific commodities, there were a few general measures to prevent the aggravation of shortages; *i.e.*, limitation of exports of certain commodities and prevention of large inventory accumulations.

CPA used its powers also to ensure maximum production of short materials and parts by granting priorities to their producers. These enabled them to obtain materials and equipment or construction materials when expansion was necessary. This same type of assistance was extended to new plants in most industries, except textiles, to small business concerns and to concerns run by veterans, in order to help these producers operate at a minimum economic rate.

Some short products required the invocation of a combination of orders to get production in sufficient volume. These then assumed the status of "programs" which CPA sponsored. Principal among these were the low-cost clothing program and the Veterans' Emergency Housing program. The low-cost clothing program was started by the War Production board and continued by CPA to take care of the clothing needs of veterans, by channelling machinery and fabrics to producers in low-price brackets.

The housing program, far more than any other, required a large number of controls. CPA attacked the problem of insufficient building materials by routing basic production materials and equipment to the building materials industry when this was necessary, by limiting the number and type of project (as to essentiality) which could draw on the pool of scarce materials and by reserving the major part of scarce building materials for housing.

The virtual end of price controls late in November brought to a close some CPA projects, such as the low-cost clothing program, which had been tied to price factors. Uncontrolled prices also made impossible the exercise of the full powers which the congress in the spring of the year had awarded to the Office of the Housing Expediter. This opened the way to the gradual resolution of the conflict between a controlled housing program and accelerating general decontrol. In December the issuance of priorities to builders of veterans' homes was stopped and measures limiting other types of home construction were relaxed considerably at the beginning of 1947.

Civilian Production Administrator John D. Small resigned on Dec. 5, stating that of the problems which remained, none, in his opinion, could be cured rapidly by the further exercise of war powers. The Office of Temporary Controls was established on Dec. 12 with Maj. Gen. Philip B. Fleming as its administrator, to take over the remaining functions and speed the liquidation of the CPA, as well as the Office of Price Administration, the Office of Economic Stabilization and the Office of War Mobilization and Reconversion. (See also PRIORITIES AND ALLOCATIONS.) (K. KR.)

Civil Liberties. Unlike the period immediately following World War I, the people of the United States expanded, rather than contracted, their civil liberties during 1946. Voluntary wartime censorship of the press and radio was promptly removed. U.S.-Japanese on the Pacific coast were permitted to return to their homes, thus correcting the racist deprivations created during World War II, and demobilization of conscientious objectors was promptly begun. In fact, transition from war to peace was made without hysteria in any quarter, thus evidencing an adult position distinguishable from the deportation hysteria after World War I.

On the civil rights of minorities front, the United States supreme court held to be in violation of the federal constitution state legislation and practices which in certain areas provided for "Jim Crow" interstate bus service, whereas other courts

THE MAGNA CARTA, symbol of Anglo-Saxon civil liberties, being placed in the strong box of the "Queen Mary" to be carried back to England from the U.S. in 1946

struck down discriminations based on race, creed or colour among applicants for public library positions. Segregation in schools of Mexican as opposed to U.S. children was judicially condemned and closed shop agreements entered into by unions as long as Negroes were segregated in auxiliary units without voting power were voided. A Florida supreme court declared that Negroes were entitled to vote in the Democratic primaries, and a Los Angeles court held unconstitutional restrictive covenants against Negroes with respect to housing. Restrictive covenants entered into between property owners and levelled against people who do not worship on Sunday were extended in many cities. A further test of the poll tax system was of no avail, and the United States senate refused to consider federal legislation to establish federal control over qualification for voting in elections of federal officials. The navy and marine corps finally admitted U.S.-Japanese into service and congress passed legislation to permit Filipinos and East Indians to become United States citizens.

The courts condemned the Associated Press as an agency operating in restraint of trade in thought, and the five leading motion picture companies, together with their three so-called satellite companies were found to be violators of the anti-trust laws and restrainers of the market place of the screen.

President Harry S. Truman appointed a committee on civil rights consisting of 15 members to report on deprivations of civil rights—lynching in particular—and to recommend new federal legislation on the subject. Hence, there would be raised the question of the wisdom of national legislation to correct anti-social folkways imposed on minority groups because of race, creed or colour. A senate investigation under the aegis of Sena-

for James Murray of the senate small business committee was scheduled to consider the frightening decline of daily and weekly newspapers in the United States in the light of the modern theory that the purpose of a free press is to attain truth by diversity of thought. There was increasing approval of international efforts to reduce the burdens on the flow of thought—movies, radio and press—throughout the world, in line with the establishment of the United Nations Educational, Scientific and Cultural organization. (See also ALIENS; ANTI-SEMITISM; BIRTH CONTROL; EDUCATION; LAW; LYNCHING; NEGROES, AMERICAN; NEWSPAPERS AND MAGAZINES; RADIO.) (M. L. E.)

Great Britain.—During 1946 the Labour government repealed the Trades Unions and Trades Disputes act, 1927, thereby removing the illegality of general strikes and lock-outs, increasing the right of peaceful picketing, restoring to civil service trades unions the right to affiliate to a political party, enabling local authorities to enforce trades unionism on their employees and giving unions their former power (under an act of 1913) to use their funds for political purposes. One of the results was an increased trades union pressure on employers to enforce trade union membership on all employees. The freedom of the press also came under consideration; on a free vote of the house of commons the government was asked to appoint a royal commission to inquire into the ownership of the press and other matters.

The government's decision to continue military conscription for an undefined period beyond Jan. 1, 1949, was regarded by many as an invasion of civil liberty, and 53 members of parliament voted against it in November.

Europe.—In France the new constitution in its preamble confirmed the Declaration of the Rights of Man of 1789 and declared certain other freedoms, such as equal rights for women, the right to work and to strike, to belong to a trade union, to collective bargaining, to social insurance, educational and professional training and the acceptance of international law.

In Poland the constitution of March 1921 remained in force, but steps were being taken to revise it. It was regarded as important that knowledge of the democratic rights secured by this constitution and various decrees and laws after the liberation should be diffused among all citizens and this was being done by committees of representatives of trades unions, political parties, lawyers and others. An innovation in the administration of justice was the appointment of lay judges to sit with professional judges, with minor cases handed over to lay courts entirely.

In Holland the only changes were the reintroduction of the death penalty for war criminals, after nearly 100 years' suspension, and an amendment of the constitution to permit the sending of conscripts to the East Indies.

In Greece the 1911 constitution, which guaranteed civil liberties, was being revised. An extraordinary security measure was passed during 1946 for a limited period, giving the government the right to deport citizens engaged in seditious activities, on the recommendation of a security commission composed of two judges and the local prefect.

In Italy a new constitution was being drafted and consideration given to the need for inserting a declaration of fundamental liberties.

In the Yugoslav constitution formed by the constituent assembly which came into force in 1946 there were 23 articles declaring fundamental liberties, supplemented by special laws on the freedom of the press, public meeting and the right of association, but under these acts these liberties could be very severely curtailed by the authorities. Albania was developing laws on similar lines.

Australia.—Wartime restrictions on the issue of passports

and the restrictions on the issue of new publications and the size of existing publications were removed, except as regards daily and Sunday newspapers, and freedom of occupation was restored by the withdrawal of the control of labour.

(R. S. W. P.)

Civil Service. The year 1946 was one of progressive readjustment to peacetime operation for the civil service in federal, state and municipal governments throughout the United States. Dissolution of virtually all war-emergency federal agencies resulted in sharp cuts in national government pay rolls, and a gradual discontinuation of the device of "war duration" appointments brought an element of stability to the public service that had been lacking during the war years.

The downward trend in federal employment, dating back to mid-1945, continued at an accelerated pace. Records of the United States civil service commission showed a total of 2,411,000 federal employees within the United States as of January 1, 1946; six months later the total had dropped to 2,299,000. By year-end the employment level had dropped below two million, and stood at 1,980,000. This represented a net reduction of approximately 400,000 employees during the year.

Personnel cuts in the war and navy departments contributed most to this reduction, but it was further augmented by curtailment of the Office of Price Administration and transfer of the United States employment service back to the various states. The Veterans' administration, on the other hand, was one of the few agencies that expanded during the year. By the end of 1946 it was the fourth largest of the federal agencies, being out-ranked only by the war, navy and post office departments.

Substantial pay increases were made throughout the public service during 1946. For the second successive year, federal employees received pay adjustments, ranging from 25% in the lowest brackets to 14% in the upper brackets. A majority of states and cities also took steps to increase pay of their employees in order to alleviate the hardship arising from the post-war inflationary trend.

The wave of strikes in industry that characterized the year also carried over into the public service. In Pontiac, Mich., a 42-day general strike of public employees brought municipal services to a standstill. Other strikes of lesser magnitude and duration occurred elsewhere, notably in Milwaukee, Wis., Portland, Me. and Rochester, N.Y. The right of public employees to strike became a lively issue in many quarters. In congress, riders attached to departmental appropriation bills required federal employees to sign "no-strike" affidavits.

A new public employee union was formed during the year when members of the United Federal Workers of America and those of the State, County and Municipal Workers of America merged into a single organization, the "United Public Workers of America," affiliated with the C.I.O.

Early in the year, the United States civil service commission discontinued its policy of making "war service" temporary appointments, and by midyear had begun to hold its first peacetime civil service examinations for permanent appointments. Similar steps were also taken in a number of states and cities to resume normal policies shelved during the war emergency.

Returning veterans in large numbers sought public service employment. In this they were aided to a considerable degree by laws giving them preference in examinations, appointments and retention in case of layoff. Among male employees in the federal service, at year-end, veterans outnumbered nonveterans by a substantial margin.

In Missouri, legislation was adopted establishing a merit system for certain departments in the state service. New Jersey

voters approved adoption of the state-administered civil service system in Hackensack, Hoboken, Riverside and Vineland. Police department employees in Omaha, Neb., were also placed under civil service during the year. (J. J. DN.)

Great Britain.—1946 was a year of intense activity for the British civil service; demobilization of the forces and the winding up of many wartime activities coincided with the reconversion of industry, the first steps in reconstruction and the heavy legislative program initiated by the government. As illustrating the above, though the nonindustrial staff of the service and supply departments declined by 45,300 between Jan. 1, 1946, and Jan. 1, 1947, the staff of other departments rose in the same period by 76,250.

Permanent recruitment, which had been suspended in war time, was reopened at the end of World War II, and progress was made in 1946 with a major program of recruitment, extending over about three years, to make good arrears, to replace temporary civil servants returning to their normal occupations and to provide for permanent expansion. In the recruitment to the higher grades greater stress was laid on personal qualities, which could be decided by interview rather than by written examination. In 1946 recruits to the higher grades were given for the first time a period of general training after appointment, but before taking up their duties, at central courses held for the whole service. There were no major alterations in the grading or structure of the civil service.

In March 1946 the office of minister of information was abolished, the ministry being reorganized as the central office of information. In Oct. 1946 a White Paper (Cmd. 6,923) was issued announcing the government's intention to introduce legislation setting up a ministry of defense; the government also abolished the marriage bar in the civil service. (E. E. Bs.)

Clapham, Sir John H. (1873–1946), British historian, was educated at King's college, Cambridge, where he won several prizes for his historical works. He was a fellow of King's college, 1898–1904, became dean in 1908 and tutor in 1913. Sir John also held the posts of Ford's lecturer at Oxford, 1926, and Creighton lecturer at the University of London, 1937. He became the first professor of economic history at Cambridge, 1928–38; his appointment followed publication of his first vol. of *Economic History of Modern Britain* (1926); vol. 2 of this series appeared in 1932 and vol. 3 in 1938. Later Harvard university conferred upon him an honorary degree of Litt.D. and Cambridge appointed him its vice-provost (1933–43). Sir John, who was knighted in 1943, had been selected by the Bank of England to prepare its archives for publication, a work that appeared in 1944 under the title *The Bank of England, a History*. He was also a member of the committee handling restitution of monuments, works of arts and archives that were seized illegally by enemy governments and individuals during World War II. Among his other works are: *The Causes of the War of 1792* (1899), *The Abbé Sieyès* (1912), *The Economic Development of France and Germany, 1815–1914* (1921), and *The Study of Economic History* (1929). He died March 29 while travelling by train to Cambridge.

Clark, Mark Wayne (1896–), U.S. army officer, was born May 1 at Madison Barracks, N.Y., where his father, Col. Charles C. Clark, was then stationed. A graduate of West Point in 1917, he saw service on the western front in World War I and was wounded in June 1918. He was graduated from the Command and General Staff school, 1935, and the Army War college, 1937. In Aug. 1942, he arrived in England to take over command of U.S. ground forces in the European theatre of operations, and in Nov. 1942, he was second

in command of the U.S. forces that landed in North Africa.

Gen. Clark was awarded the congressional medal of honour for having staged, three weeks before the invasion, a successful secret mission to French North Africa where he established contact with French officers and laid the groundwork for the landings. He also was promoted to lieutenant general. Clark led the U.S. 5th army in the invasion of Italy in Sept. 1943, and in Nov. 1944, he was made commander of the Allied 15th army group. He was named (March 13, 1945) for promotion to the rank (temporary) of full general. In April 1945, he launched the final Allied offensive in Italy and on May 2, German forces in northern Italy and part of Austria surrendered to his armies. Clark, who was designated (June 28, 1945) as commander of U.S. occupation forces in Austria, voiced several protests over soviet policy in Austria and asserted (Sept. 11, 1946) that soviet occupation authorities in eastern Austria took "almost everything on the ground that it is a German asset."

In early 1946, a group of former officers that fought under Clark in Italy charged that the general's "blunders" caused unnecessary bloodshed in the Rapido river crossing and urged the senate military affairs committee not to approve his appointment to the permanent rank of major general. The war department stated, however, that Clark had employed "sound judgment" in the battle and his appointment was confirmed June 20, 1946. On Jan. 6, 1947, the war department disclosed that Gen. Clark had been transferred to the command of the U.S. 6th army in San Francisco.

Clark, Thomas Campbell (1899–), U.S. lawyer and attorney-general, was born Sept. 23 in Dallas, Tex. He was graduated with an A.B. degree from the University of Texas (1921) and practised law. He was civil district attorney of Dallas county, 1927–32. In 1937, Clark was made special assistant to the attorney-general of the U.S. He was shifted to the department's antitrust division (1938), was later named co-ordinator of alien enemy control in the Western Defense command, and was given charge of the War Frauds unit in the antitrust division in May 1942. Clark became assistant attorney-general of the antitrust division (March 1943) and in Aug. 1943, he headed the justice department's criminal division with his authority extending to the War Frauds unit. President Truman named Clark to succeed Francis Biddle as U.S. attorney-general, May 23, 1945. Clark assumed office June 30.

In 1946, Clark lifted the wartime curbs on enemy aliens (Jan. 7) and approved (June 16) the sale of the \$200,000,000 government steel plant in Geneva, Utah, to the U.S. Steel corporation for \$47,500,000; the government was subsequently criticized for the latter action. Clark supported Secretary of the Interior Julius A. Krug in his dispute with John L. Lewis over the validity of the Krug-Lewis coal agreement and stated Nov. 15, that the pact applied "for the full period of government operation."

Clay, Lucius DuBignon (1897–), U.S. army officer, was born April 23 in Marietta, Ga. He was graduated from the U.S. Military academy in 1918, and during the latter days of World War I was an instructor at an officers' training school. Clay taught military science and tactics at Alabama Polytechnic institute (1921), and was assigned as an instructor at West Point (1924). During the following years, Clay was associated with a number of army construction and engineering projects in the United States and abroad. A month after the U.S. entry in World War II, Clay went to South America to locate defense airports there. On his return, he was made deputy chief of staff (March 1942) for

requirements and resources in the army service of supply; he was promoted to the rank of a major general the following December. Gen. Clay was transferred to the Office of War Mobilization and Reconversion in Dec. 1944 as deputy director for war programs and administrations. On March 29, 1945, Pres. Franklin D. Roosevelt appointed Clay as deputy to Gen. Dwight Eisenhower in charge of civil affairs in Germany; the following month, Clay was promoted to lieutenant general. In addition to being deputy to Eisenhower (and later to Gen. Joseph T. McNarney), Clay also headed the U.S. group on the Control council for Germany and was deputy military governor of the U.S. zone of occupation.

In the summer of 1946, Clay proclaimed an amnesty for all nazi-inclined "offenders" up to the age of 27, excepting active nazi party members and supporters. On Nov. 5, he told German officials in Stuttgart that unless there was "real and rapid improvement" in their denazification measures within 60 days, the U.S. military government would take over. On Jan. 6, 1947, Gen. Clay succeeded McNarney as commander of U.S. occupation forces in the European theatre.

Clays. Shipments of kaolin in the United States rose from 873,056 short tons in 1944 to 939,988 tons in 1945, accompanied by a 7% increase in value. Although the common-name for this type of clay is china clay, only 9% of the 1944 output was used in ceramics, against 10% in refractories, 59% in paper and 17% in rubber. Sales of ball clay rose from 155,667 tons in 1944 to 174,524 tons in 1945, mostly used in pottery. Consumption of fire clay and stoneware clay declined from 6,344,383 tons in 1944 to 6,090,411 tons in 1945. Miscellaneous clays, used mostly in cement and heavy clay products, increased from 9,080,717 tons in 1944 to 10,848,686 tons in 1945.

Total output of these types of clays was 17,153,823 tons in 1944 and 18,053,609 tons in 1945. Of the respective totals 3,520,735 tons and 3,611,944 tons were sold by the producers, while 13,633,088 tons and 14,441,665 tons were used by the producers in the manufacture of clay products. (See also BENTONITE; FULLER'S EARTH.) (G. A. Ro.)

Clayton, William Lockhart (1880—), U.S. government official and cotton broker, formerly headed the firm of Anderson, Clayton and company in Houston, Tex. He joined the department of commerce in 1942 as an assistant secretary. He also was vice-president of the Export-Import bank and, in 1944, was appointed federal war surplus property administrator.

On Dec. 4, 1944, Pres. Roosevelt named Clayton assistant secretary of state. A strong supporter of the Reciprocal Trade Agreements act, Clayton proposed establishment of a new international trade charter, which, with minor amendments, was subscribed to by 17 nations at London in Nov. 1945. On Aug. 1, 1946, he was appointed undersecretary of state for economic affairs, a newly created office.

Clayton's defense of the \$3,750,000,000 credit to Britain in 1946 was criticized by some opposition leaders in congress who implied that the cotton brokerage firm in which his family had a 40% interest would gain thereby. Clayton declared, however, (Jan. 17, 1947), that the firm had sold only $\frac{1}{4}$ of 1% of its cotton to Britain during the year ending July 31, 1946.

Cleveland. Sixth largest city in the United States, Cleveland, O., had a population of 878,336 by the federal census of 1940. Area 73.1 sq.mi.

In 1946 Cleveland celebrated the 150th anniversary of its founding. Dozens of events were held in the course of the year

to salute the memory of Moses Cleaveland, the city's founder. Attracted by the sesquicentennial events, more than 1,000,000 visitors went to Cleveland during the year.

The municipal budget was set at a record high of \$21,363,997. At a special election in February voters authorized the city government to levy an additional \$3,350,000 for operating and maintenance purposes. Another city levy of \$3,317,784 was approved at the regular November election. Passed at the same time were a Cuyahoga county welfare levy of \$2,847,574 and a board of education levy of \$1,980,000. Expenditures of the county government in 1946 were \$19,920,010. The board of education passed a single salary schedule for teachers, establishing minimum and maximum pay, and later in the year raised the pay of all its salaried employees.

Judges elected in 1946 were: Lee E. Skeel and Joy Seth Hurd to the court of appeals; Homer G. Powell, Joseph A. Artl, Frank S. Day and Burt W. Griffin to the common pleas court; Harry L. Eastman and William J. McDermott, to juvenile court. Gov. Frank J. Lausche appointed as judges of Cleveland's municipal court: Frank D. Celebrezze who had been city safety director; Anthony A. Rutkowski, former chief police prosecutor and Brookes Friebolin who had been assistant city law director.

Other events in 1946 included the following: The city was without newspapers for 32 days as pressmen went on strike. The county exceeded its quota in the Victory Bond drive, buying \$27,490,130 in government bonds. Mgr. John R. Hagan was appointed titular bishop of Limata and designated auxiliary bishop of the Cleveland Catholic diocese in May. He died in September following an operation.

Estimated value of products made in Cleveland in 1946 was \$2,500,000,000. At the year-end employment was within 2½% of the V-J day level and the weekly pay roll of industrial wage earners was in excess of \$9,000,000. Steel ingot operations in the Cleveland district averaged 80% of capacity for the year as compared with the national average of about 72%. The Cleveland Stock exchange had the largest volume of business in 16 years. Building construction for the year was \$36,018,700 as against \$23,881,350 in 1945 but the housing shortage continued as acute as ever. Postoffice receipts were \$14,401,882 in 1946 as against \$13,456,446 in 1945. Bank clearings were \$12,434,528,324 in 1946 and \$11,377,621,183 in 1945. (P. By.)

Climate: see METEOROLOGY.

Clothing Industry. The year 1946 accented the shortage of clothing throughout the world. In the United States and Canada production hit an all-time high, surpassing that of 1941. However, where quantity gained, quality suffered. Materials and make were in most instances far inferior to prewar standards; postwar quality was not up to even wartime standards. Clothing prices were high and went higher with the abolition of price control. The apparently insatiable demand for apparel tapered at year's end.

Manufacturers had a mixed year. On the one hand they had few labour troubles and could sell everything they could turn out, thus being assured of substantial profits. On the other hand many shortages continued; machinery was difficult to obtain; in many instances suppliers were five years behind on deliveries, piece goods was priced high and deliveries restricted; trimmings (particularly rayon lining and good pocketing) remained very difficult to secure. Moreover, in the large centres, manufacturers who used outside contractors to do their sewing felt an extreme pinch in production facilities. Generally this was due to the fact that demand for merchandise was so strong that even dyed-in-the-wool contractors were making and sell-

ing their own clothing. As in every lush period the number of new firms was large and many old small manufacturers looked to the years ahead with apprehension. Basically the industry was sound.

Machinery developments continued. Two large suppliers brought out electric bonding machines that fused thermoplastics by an electronic beam. This type of machine was offered in various models including feed-off-the-arm, bar tack, straight seamer, etc. A radical development in the cutting room was the appearance of an electrically operated cloth spreader that started and stopped automatically, thus saving considerable manpower. Special cutting machines were developed for new and unusual materials that presented new problems. New shade marking machines offered increased speed and variety in that operation. All types of equipment were far behind scheduled deliveries. Even such small items as proportional dividers (used in grading patterns), pattern notchers and punches were hard to obtain. Tailor squares were scarce throughout the world; manufacturing shortages caused the traditional boxwood square to be changed to maple and metal trimmings were eliminated on many models.

Style changes in men's clothes were minor; with the end of all OPA (Office of Price Administration) restrictions the two pants suit and vests with double-breasted coats returned. Toward the end of the year a slight trend away from sportswear and roughwear was noted. Outstanding fads were heavy plaid woollen shirts and multiple layer outer garments for winter wear. Although tremendous amounts of clothing were sold as war surplus, no appreciable immediate harm was done to the civilian market by this disposal. What the long range effect would be was problematical. Traditionally war surplus goods sell best, and hurt most, in years of low income.

The textile market worked overtime to produce the materials for the cutters; competition was nil and new products were few. However, research continued with the promise of many interesting fabrics for the future.

Internationally, the clothing industry took on added importance. Many small countries, previously using homemade or custom-made clothing suddenly became the location of large modern factories. This was especially true in Central and South America, Africa and India.

In Great Britain textile production increased but the necessity for export hindered the yardage available for home consumption. Most restrictions were eliminated but the situation remained harsh. In continental Europe good clothing was extremely difficult to obtain because of a lack of textiles, trimmings and manufacturing equipment; nevertheless rebuilding went on and the situation was easing. World-wide clothing manufacturers installed new, individually motored tables and new machines, mostly made in the United States of America.

Many countries including Great Britain, France and Australia sent delegations to the United States to study its machines, methods and styles, as well as to purchase new equipment. Other countries were represented by individual manufacturers eager to observe mass production methods. The delegations in many countries made written reports to the industry containing recommendations, etc.

The year ended in the United States with peculiar market actions. Retail prices broke badly and the first signs of a buyer's market could be discerned. This stemmed directly from consumer reaction to poor, high-priced apparel. Manufacturers and retailers proceeded to set their houses in order, not knowing what to expect.

Coal. Data on world production of coal have been received from a number of countries for the years of World War II, but in the data presented in Table I there are still a number of gaps to be filled, mostly among producers of intermediate importance. Germany is the only major producer for which data were lacking in 1946. In 1945, for the first time after 1938, data were available for all of the countries listed in the table (with the exception of China). Total output for all countries for which figures were at hand for both years shows a decline of 9% in output between 1938 and 1945, although 1938 itself was an off year, 6% below 1937. Production was therefore back about to the 1935 level. What the peak output of the war years amounted to still remained to be seen. It is clear, however, that 1945 included some sharp declines from preceding years. There was such a drop in European production because of the disorganization at the end of the war, along with smaller declines elsewhere, that the countries with figures for both 1944 and 1945 showed a decrease of 19%. The 1945 outputs in Europe were being improved in 1946, but these increases would be offset by decreases elsewhere, especially in the United States.

United States.—Coal production in 1945 would possibly have made some decline, along with most other mineral products as the war closed, but the perennial handicap of the industry, strikes, settled the matter definitely by cutting output 7% in bituminous mines and 8% in anthracite mines. Bituminous production dropped from 619,576,000 short tons in 1944 to 575,840,000 tons in 1945, while anthracite output dropped from 63,701,000 tons to 54,934,000 tons. Total production dropped from 683,277,000 tons to 630,774,000 tons, and consumption was reduced from 591,830,000 tons to 560,060,000 tons.

Table II.—*United States Coal Production*
(Thousands of short tons)

	Bituminous	Anthracite	Total	Consumption	Men Employed
1939	394,855	51,487	446,342	376,296	422,000
1940	460,772	51,485	512,256	431,331	439,075
1941	514,149	56,368	570,517	492,445	456,981
1942	582,693	60,328	643,021	540,629	461,991
1943	590,177	60,644	650,821	594,517	416,007
1944	619,576	63,701	683,277	591,830	393,347
1945	575,840	54,934	630,774	560,060	370,000
1946 (est.)	527,400	61,000	588,000	?	?

Except for a slow recovery in output after the Christmas holidays, 1946 got off to a good start, with bituminous output totaling 161,000,000 tons in the first quarter. April and May brought the most extended coal strike in several years, with two weeks' normal output in the two months. Operation then proceeded at much more than 12,000,000 tons weekly until mid-November, when 3 weeks were lost in another strike. Production to Dec. 28 totalled 523,832,000 tons, with 527,400,000 tons estimated for the full year. This output was below the demand level, and supplies were short. Taking out the time lost in strikes, however, the output made a good showing for the time worked; a full year worked at the same rate would have given an output approaching 650,000,000 tons.

The strike situation became quite complicated during 1946

and remained unsettled at the end of the year. When the mine operators failed to reach an agreement with the miners in May, the government took over the mines and completed an agreement with the union. Since the government had granted more concessions than the operators had been willing to make, or were later willing to take over, the government was forced to continue the operation of the mines. Then, to complicate matters still more, in November the union by unilateral action voided the contract with the government, and though no formal strike was called, the miners put into operation their established practice of "no contract, no work." At this time coal stocks were short, not yet having been replenished after the previous strike, and after a couple of weeks of fruitless bickering the situation was becoming critical. On order of the president matters were turned over to the courts, and the union was fined \$3,500,000 for breaking its contract with the government. After this setback the miners were ordered back to work until the decision of the lower court could be reviewed by the supreme court, and so matters rested at the end of the year.

Table III.—United States Production of Coal, by States
(Millions of short tons)

	1939	1940	1941	1942	1943	1944	1945
Alabama	12.0	15.3	15.5	19.3	17.2	18.8	18.7
Colorado	5.9	6.6	6.9	8.1	8.3	8.2	7.7
Illinois	46.8	50.6	54.7	65.1	72.6	76.8	72.5

West Virginia	108.4	126.4	140.3	155.9	158.8	164.7	152.2
Wyoming	5.4	5.8	6.6	8.1	9.2	9.5	9.9
Others	21.7	23.7	24.8	27.9	28.3	28.3	25.9
Total Bituminous	394.9	460.8	514.1	582.7	590.2	619.6	576.0
Anthracite	51.5	51.5	56.4	60.3	60.6	63.7	54.9
Grand Total	446.3	512.3	570.5	643.0	650.8	683.3	630.9

In anthracite the record was much better. The production level was well maintained and little time was lost. The terms of the settlement of the bituminous strike had already been

COAL, badly needed because of the coal miners' strike, was toppled into the Hudson river in the spring of 1946 when a New York Central-West Shore railroad car float sprang a leak

agreed upon when it came time for the renewal of the anthracite contract, and approximately the same terms were arranged for the anthracite miners, after only one week of full loss of time, though during the last few weeks of the bituminous strike the anthracite output had been cut appreciably, since many miners failed to report for work, as a sympathetic move in favour of the bituminous miners. Anthracite production to Dec. 28 was 60,307,000 tons, equivalent to a year's total of about 60,600,000 tons, and an increase of 10% over 1945.

Great Britain.—On Dec. 19, 1945, the minister of fuel and power presented to parliament a bill to nationalize all coal mines, together with certain ancillary undertakings in Great Britain. During the early part of 1946 the bill was fully and at times bitterly debated in the house of commons, but in due course it became an act without any really important amendments. Members of the national coal board were appointed during the year and were to take over on Jan. 1, 1947, all responsibility for getting coal. An independent tribunal fixed the gross compensation to be paid to the existing colliery companies. How this was to be distributed was not made public at that time, but it was interesting to note that the price of many colliery company shares had risen substantially during the year. The coal board made no public statement of its policy, but from various appointments it had made it appeared that its policy was to divide the producing coalfields into about eight to ten districts within natural geological boundaries. Each district was to be self-contained, subject only to general policy control by the national board. Within the districts the mines would probably be segregated into groups and these groups also might be self-contained. The grouping had not been completed by the end of 1946.

This major change in ownership naturally caused uneasiness among all connected with the industry. The owners did not know what compensation they were to receive for their property, the company directors did not know if their services would be retained or not, the senior officials were perturbed about their personal futures and the miner, although jubilant at achieving his long-sought political ambition, realized that

he might not benefit to the extent that the extremist element had led him to expect. The long-standing familiar relationship between a good private employer and his employees might be succeeded by a bureaucracy in which many unofficial privileges would disappear. Unremunerative mines might be closed, and inefficient mines might have their personnel transferred *en bloc* to a modern mechanized mine, which would mean uprooting the miner from a village where his family had lived for generations and replanting him in a strange locality.

On the other hand the general state of the coal mines rendered nationalization almost inevitable. During the preceding 25-30 yr., partly because of national causes (such as exhaustion of the more easily wrought seams of coal) but mainly because of the unsettled state of the industry resulting from competition in the export market and friction between employer and employee with the inevitable rise in costs of production, owners had been prevented from seeking finance to modernize their mines. There were, however, a number of remarkable exceptions to this general statement.

During the year the output per person employed ceased its downward trend and showed signs of rising. Senior members of the National Miners' federation exhorted their men to produce more coal, pointing out that, now that nationalization was on the statute book, it was up to the miner to justify his claim that the industry would prosper under single ownership. Increased underground mechanization was installed, and British machinery manufacturers expected soon to produce a plant to meet all requirements. Mining engineers from Europe and the U.S. were being employed by the national coal board and British engineers visited overseas mines to a greater extent than ever before.

Table IV.—Coal Industry in Great Britain, 1945 and 1946

	1945	1946
Number of persons employed	697,600	691,000
Average output per week (thousand short tons)	3,740	4,290
Output per man per shift (short tons)	1.08	1.17

Other Producers.—Production for all of the other producers of importance are shown in Table I, for both 1944 and 1945. These figures show clearly the extent to which production operations were disorganized at the close of World War II, the effect being particularly detrimental in the European countries after liberation from occupation. As local government was re-established in the various areas, marked progress was made in improving coal output, but even at the end of 1946 fuel supplies were inadequate throughout the whole of Europe. To supplement the data in the table, the following items record progress in 1946, so far as information is available at the time of writing.

Canada.—After declining 11% from 1942 to 1945, much of the previous loss was regained in 1946, with an output of 17,692,000 tons, 7% over 1945.

Belgium.—Although the production rate averaged a little better than 1,000,000 short tons a month during the latter half of 1944 and the first half of 1945, it dropped to a low of 190,000 tons in Sept. 1944. Improvement in the latter half of 1945 brought the monthly output up to 1,900,000 tons at the end of the year, and the total for the first half of 1946 to 12,413,000 tons, better than three-quarters of the prewar rate.

Czechoslovakia.—Production was at a minimum in midyear of 1945, recovering to 2,800,000 tons in December. Improvement continued into 1946, with 15,523,000 tons in the first 5 months—12% under the 1939 rate. Output during the occupation appears to have been above the prewar rate.

France.—Production sagged to little more than 1,000,000 short tons monthly in Aug. and Sept. 1944 but improved steadily after that time. The total for the first half of 1946 was 30,970,000 tons, which is 6% better than the 1937 rate, but 4% less than the 1939 rate.

Germany.—Output increased from around 5,500,000 short tons in June 1945 to 18,500,000 tons in December, and 20,400,000 tons in May 1946, with a total of 99,200,000 tons for the first 5 months of 1946.

Netherlands.—Production increased rapidly from 410,000 short tons in June 1945 to 687,000 tons in October, was irregular in the last quarter of 1945 and the first quarter of 1946 and rose to 840,000 tons in July, with a total of 5,041,000 tons in the first 7 months of 1946.

Poland.—Production increased from a low of 1,000,000 short tons a month in April 1945 and had almost reached the prewar level by the end of the year. The total for the first half of 1946 was 23,852,000 tons, 14% above the 1938 rate.

India.—Total production in the first 5 months of 1946 was 13,132,000 short tons, about on a par with 1939. (See also FUEL BRIQUETTES.) (G. A. Ro.; J. A. S. R.)

Coast and Geodetic Survey, U.S. A major achievement for the year 1946 was the successful adaptation of electronics to hydrographic surveying by the coast and geodetic survey. One of the electronic distance-measuring devices, known as Shoran, developed during the war for precision bombing, was used as the means of fixing the positions of survey ships engaged in sounding ocean depths. The equipment was operated between ship and shore stations at the extreme western end of the Aleutian chain of islands, and off the coast of New England. Precise locations of sea bottom conformations needed for the modern nautical chart were obtained in these regions. Ship positions were determined as close as one mile from the stations and at varying distances extending 102 mi. to seaward. Experimental modifications of several nautical charts were prepared for ships equipped with electronic systems of navigation.

Supplemented by detached units engaged in coastal triangulation and photogrammetry, 13 survey vessels carried on hydrographic surveys in the United States and Alaskan waters. These surveys formed the basic data for the compilation of nautical charts. In 1946, 2,250,000 copies of these charts were printed and issued for the guidance of navigation.

Primary and secondary tidal stations were maintained to gather observations on the flow of sea tides and tidal currents. The publication of daily predictions of tides and currents for all United States ports and for major world ports was printed for a year in advance.

Photographic records of the continuing changes in the earth's magnetic elements were made at the five observatories operated by the bureau. Important data for use in engineering seismology were obtained through the operation of seismographs in many locations in the western states when strong motion earth tremors were recorded.

The coast and geodetic survey furnished basic horizontal and vertical control for engineering and mapping purposes throughout the various states and in Alaska. Principal field operations were the extension of the triangulation and levels in the Columbia river valley for use by other agencies for flood control and power and irrigation projects. A second major field activity was the initiation of similar work in the Missouri river valley. Geodetic parties also operated in Indiana, Nevada, Utah, Arizona, Texas and California.

The sixth consecutive year of the bureau's participation in the program of the state department for scientific and cultural co-operation in the American republics was productive of the most practical results up to that time in standardizing methods and procedures and in the exchange of technical personnel. Seventeen experts from nine American republics attended conferences in the United States, and nine members of the coast

and geodetic survey inspected field operations in several South American countries.

The issue of 6,000,000 aeronautical charts and 4,000,000 airport charts reflected the return of civil aviation to greater peacetime activity.

(L. O. C.)

Coast Guard, U.S. As the coast guard returned to its peacetime role under the treasury department on Jan. 1, 1946, increasing emphasis was placed upon its two important functions of maritime safety and law enforcement. Practically all of the 350 navy and 291 army vessels the coast guard had manned during the war had had their crews removed by midyear 1946. The 764 of its own vessels of 65 feet or over, which had been operated during the war, growing from a Pearl Harbor day total of 262, had by the end of the 1946 fiscal year been reduced to 269 actively in commission. Altogether this reduction in the number of vessels manned, together with a reduction in the number of shore units from a wartime peak of 2,237 to 798 on June 30, 1946, had made possible a reduction of military personnel to 26,406 by that time, which was one-seventh the wartime peak and somewhat below the Pearl Harbor day total of 27,415. By Dec. 6, 1946, military personnel had dropped further to 22,156 to meet budgetary requirements, although meanwhile many lifeboat stations had to be placed in a limited caretaker or inactive status and some vessels tied up because they lacked complements.

Under its wartime authority to protect vessels, harbours, ports and waterfront facilities, the coast guard had supervised the safe loading of about 15,500,000 tons of explosives and ammunition in U.S. ports without a major casualty or loss of life. On its return to treasury jurisdiction, this activity continued on an ever-diminishing scale, with only small details of officers remaining on duty in European and Pacific theatres of operation, supervising the reshipment of dangerous cargoes to the United States and their unloading at army and navy ordnance depots on the Atlantic and Gulf coasts.

On Sept. 5, 1946, the Air-Sea Rescue agency, an inter-departmental group, headed by the commandant of the coast guard and engaged in the study of improved and standardized rescue and search methods, was renamed the Search and Rescue agency. Search and rescue units of the coast guard were at the same time integrated into the peacetime organization and the whole developed into a system of constantly alerted communications, coastal lookout and patrols to institute instant and systematic search and rescue procedure in case of maritime disaster. During the 1946 fiscal year the coast guard rendered 6,815 major assistances involving the saving of life or assisting vessels and aircraft in distress, 3,002 miscellaneous assistances and saved lives or rescued persons from peril in 5,753 cases.

The coast guard's 11 air stations were returned by the navy to the operational control of the coast guard on June 30, 1946. In addition to resuming their regular prewar functions, the 195 fixed wing and 31 rotary aircraft attached to them, most of them navy owned, performed search and rescue work, and assumed additional duties of supplying remote Loran and other aids to navigation stations in the Pacific ocean area. During the 1946 fiscal year 179 emergency medical cases were transported, 91 disabled or crashed planes located, 166 obstructions to navigation derelicts reported and 257 illicit distilleries located.

In March 1946 the North Atlantic Ocean patrol was organized, its activities embracing direction of the International Ice patrol, Greenland patrol, Ocean Weather patrol and Aids to Navigation in Labrador, Greenland and Newfoundland. This new patrol also afforded minor logistic support to naval bases in Greenland. Navy patrol squadron No. 6, a coast guard manned

U.S. COAST GUARD CUTTER "MODOC" circles an iceberg as part of International ice patrol work. A B-24 plane overhead checks data with the cutter, which passes information to near-by ships. This work, interrupted by World War II, was resumed in the spring of 1946

unit, operating in the North Atlantic, was transferred to coast guard jurisdiction and became air detachment, North Atlantic

Ocean patrol, engaging principally in ice observation for the International Ice patrol which resumed its operations after a war-time interruption. Three cutters based in Argentia, Newfoundland, maintained continuous patrol from March 15 to July 27, 1946, and a summary of ice conditions which they gathered was sent out from the shore radio stations at Argentia twice daily for the benefit of North Atlantic shipping. For the first time aircraft supplemented the work of the patrol vessels, scouting for ice and determining the limits of the ice fields from the air. One of the cutters, the "Mojave," was engaged in experimental studies relating to radar detection of floating ice. By midyear, the coast guard, in co-operation with the weather bureau, was maintaining, in the interests of trans-ocean marine and air commerce, two ocean weather stations in the Pacific, east of Hawaii, and one in the Atlantic. These were transferred by the navy to the coast guard at this time and plans were made to augment their number as personnel became available. Seventy coast guard coastal stations were, at the same time, making regular reports of weather conditions for the weather forecasting service.

The coast guard's new icebreaker "Mackinaw" on the Great Lakes was able to keep the most essential channels and ports open to navigation, where necessary, during the 1945-46 season, being assisted by tender class cutters. On the Hudson, Penobscot and Kennebec rivers ice-breaking service was also rendered to marine commerce during the season.

There was a net increase of 339 aids to navigation during the 1946 fiscal year, bringing the total to 36,879. The Scotch Cap Light station in the Aleutians was completely demolished by an earthquake and tidal wave on April 1, 1946, with the loss of the entire complement of five men. All lightships removed from their stations during the war had been restored except Fire Island lightship, which had been replaced by a large-type whistle buoy and radio beacon on shore at Fire Island Light station, N.Y. Continued expansion of Loran, a system of radio navigation designed during the war to furnish reliable longitude and latitude positions over greater areas than those covered by radio systems, was being effected for application to peacetime navigation by air and surface craft. At the turn of the fiscal year, 49 fixed transmitting stations on shore were located at strategic points forming 11 chains from Greenland to Tokyo, providing coverage over a wide expanse of ocean for U.S. commercial and military marine and air transport. Eleven Racon stations were in operation at this time along the coasts of the United States, and in Alaska, Hawaii and Puerto Rico, providing a coded response to radar interrogations on the proper frequency and giving a navigational fix in all weather conditions to air and surface craft by means of simultaneous display of both range and bearing information.

During the 1946 fiscal year 693 new vessels aggregating 3,210,798 gross tons were built in U.S. shipyards and certified by the coast guard as meeting safety requirements. As shipbuilding tapered off, inspection incident to repairs, conversions and alterations of transports to passenger vessels, increased. Annual inspections of 8,005 merchant vessels and 488 government vessels, together with 648 boilers on government ships and 976 boilers in government shore establishments swelled the total of marine inspection activity. In addition, 7,447 drydock examinations of craft under construction, repair or conversion, 2,164 reinspections and 126 special surveys were augmented by inspections of all hospital and troopships, both U.S. and foreign, departing from the United States. Inspection of boilers, lifeboats, life rafts, line-throwing guns and other safety appliances at manufacturing plants rounded out a busy year. There were 6,652 casualties to merchant vessels or loss of life or injuries to seamen aboard such vessels investigated to learn their causes and give consideration to remedial measures. The coast guard laid emphasis on securing compliance with the navigation laws through education and co-operation rather than upon assessing penalties, except in cases of wilful violations. During the fiscal year 27,307 more motorboats were given numbers under the provisions of the Motorboat act of 1918 than during the previous fiscal year, bringing the total to 411,310. The International Load Line convention, suspended from 1941, was restored by presidential proclamation to full effectiveness on Dec. 21, 1945, and the coast guard resumed cognizance over its observance in the interests of safer loading.

Merchant marine hearing units, dealing with disciplinary cases of merchant officers and seamen, functioned in all important U.S. ports, and at foreign ports in Europe and the far east, where volume of shipping made them necessary. There were 34,258 cases of misconduct, negligence and incompetence investigated, resulting in 1,001 officer licences and 6,352 seamen certificates being either suspended, revoked or the holders placed on probation for definite periods. Shipping commissioners executed 25,562 sets of shipping documents, issued 15,158 waivers of manning requirements and received 4,568 reports of crew shortages.

Enlistments in the coast guard totalled 10,020 during the year, all original enlistments, beginning in March 1946, being for three-year periods only, for men without previous coast guard experience. One recruit training station at Mayport, Fla., and 14 recruiting stations remained in commission. There were 7,356 men graduated from various coast guard service schools, qualifying them for duty in specialized fields.

Membership in the nonmilitary Coast Guard auxiliary, an organization of motorboat owners, yachtsmen, airmen and amateur radiomen or other

U.S. COAST GUARD CUTTER "EAGLE," formerly the German training ship "Horst Wessel," sailing toward New London, Conn., where the bark was to be used for training purposes in 1946

specially qualified persons, and designed to assist the coast guard on a voluntary basis in the field of maritime activity, numbered 44,963 on June 30, 1946. Its membership embraced affiliation of 13,239 boats, 33 aeroplanes and 7 amateur radio stations. In addition to promoting safety among motorboat and yacht operators, its members voluntarily augmented the meagre complement of many coast guard lifeboat stations and patrol boats during the critical personnel shortage brought about by demobilization and deployment.

U.S. Coast Guard Academy.—The U.S. Coast Guard academy at New London, Conn., founded in 1876, is an institution of higher learning for the training of commissioned officers for the coast guard. Its present home, overlooking the Thames river, was constructed in 1932, with additions made just prior to World War II. The red brick, Georgian colonial buildings centre around the administrative building, Hamilton hall, named after Alexander Hamilton, first secretary of the treasury and founder of the coast guard in 1790.

At the end of 1946 there were 283 cadets. Entrance is restricted to unmarried men between 17 and 22 years of age, and appointments are obtained through competitive examinations. Emphasis is placed on a practical program in which engineering, deck work, deck instruction, pre-cruise readiness, Combat Information Center course, navigation drills, seamanship, tactical signal drills, damage control drills, marlinspike seamanship drills, buzzer drills, night lookout trainer drills and steering trainer drills are featured in a 21-week program in which three training vessels are used. The academy confers upon its graduates the bachelor of science degree and a commission of ensign in the U.S. coast guard. About 100 cadets graduate each year.

(J. F. Fy.)

Coast Guard Academy, U.S.: see COAST GUARD, U.S.

Cobalt. In 1938 and 1939 the world production of cobalt was about 4,000 short tons a year, most of which came from the Belgian Congo and Northern Rhodesia, with smaller amounts from French Morocco, Canada and Burma, and minor outputs from several other places. During the years of World War II outputs declined except in the Congo, averaging 3,500 tons. The United States had no prewar output, but built up a war production that reached 382 tons in 1943 and 575 tons in 1945. The bulk of the output was consumed in the United States, where imports reached a peak of 2,946 tons of cobalt in ore, alloy and metal in 1943, but later declined.

Consumption shifted radically after the cessation of hostilities, as is indicated by the following quarterly totals of approximate uses of different kinds, in short tons:

	1944 Ave.	I	II	1945 III	IV	I	II	1946
Metallic uses	475	575	568	342	233	231	279	
Salts and driers	82	98	98	79	83	103	132	
Nonmetallic uses	23	22	34	38	51	68	76	
Total	580	605	700	459	367	402	487	

Metal uses, in order of importance, are stellite and carbide-type alloys, magnet steels, high speed steels, welding rods and other special steels. Nonmetallic uses are chiefly in frits and pigments. War supplies were maintained sufficiently well to leave some 3,700 tons of accumulated stocks at the end of 1945—1,800 tons held by metals. Data for the first half of 1946 showed a decrease in government stocks and an increase in consumer stocks.

(G. A. Ro.)

Cochin-China: see FRENCH COLONIAL EMPIRE.

Cocoa (CACAO). The supply of cocoa in the United States continued low through 1946 at about the same level as in 1945 or four pounds per capita in terms of beans. Imports were smaller in 1946 than in 1945 but increased toward the end of the year when prices were decontrolled, although the British government continued to handle the production of British West Africa which normally produces two-thirds of the world's supply. The Bahia Cocoa institute took over control of the Brazilian crop in October and began to license all exports. Under war regulations the price of cocoa beans was held at about nine cents per pound in New York. In October the price began to advance and reached a top of more than 25 cents per pound by mid-December.

(J. C. Ms.)

Coconuts (COPRA). The United States began in 1946 to return to its prewar place as the largest importer and consumer of both coconut oil and copra. An agreement was made between the United States and Philippine governments under which the United States agreed to buy all of the surplus copra and coconut oil of the Philippines for the year beginning July 1, 1946, at fixed prices of \$103.56 per long ton for copra and 7.1 cents per pound for coconut oil. A similar agreement was made with the Netherlands government for the year beginning Sept. 1, 1946, at \$110.25 per short ton in the Netherlands Indies. A part of these purchases by the United States could be allocated to other countries by the International Emergency Food council. Exports of copra from the Philippines during the first six months of 1946 totalled 190,000,000 lb. in terms of oil, about two-thirds being shipped to the United States.

(J. C. Ms.)

Coffee. The United States supply of coffee, all imported, increased in 1946 to an average of about 17.2 lb. per capita, green basis, for civilians compared with 16.7 lb. consumed in 1945 and 13 lb. at the low point in 1943. Imports of coffee were 2,717,000,000 lb. in 1945, compared with the low record of imports in 1942 when only 1,714,000,000 lb. were imported, which was about the prewar average. Supplies for 1946 were increased, particularly during the late months of the year when prices were decontrolled. Imports for the first half of 1946 amounted to 1,195,218,000 lb.

World coffee production for 1946-47 was forecast at 35,500,000 bags compared with the 1945-46 crop of 32,700,000 bags. These crops were below the prewar average of 43,100,000 bags, 1935-39, during which period a large surplus accumulated and much coffee was destroyed in Brazil. Brazil expected a crop of 19,900,000 bags 1946-47 of which 14,600,000 bags

were exportable. This output was above the preceding four years but below the prewar level when Brazil produced more than 60% of the world's coffee. The crop of 1945-46 was divided among the areas as follows: South America 29,128,000 bags; Africa, 3,019,000 bags; Asia and other areas, 513,000 bags.

During the first six months of 1946 South America exported only 1,500,000 bags of coffee to Europe. It was estimated that if shipments during the second half of the year continued at the same rate the total would be only one-third the prewar total. Shortage of exchange was stated to be the cause of the small purchases by European countries. France, the largest consumer, was confining its buying almost entirely to its colonies. Great Britain was buying considerable quantities of coffee from Brazil because the latter had agreed to accept sterling in payment. (See also BRAZIL; GUATEMALA.) (J. C. Ms.)

Coinage. The United States mint, an adjunct of the treasury department, was established by act of congress April 2, 1792, and was located in Philadelphia, Pa. The service as constituted in 1945 consisted of mints in Philadelphia, Denver, Colo. and San Francisco, Calif.; the U.S. depository (for gold) at Fort Knox, Ky., and the U.S. depository (for silver) at West Point, N.Y., and U.S. assay offices at New York city and Seattle, Wash. The administrative offices are in Washington, D.C., from where the entire service is administered by the director of the mint.

Not only do the mints make all coins for the U.S., but they also produce large amounts for many foreign governments lacking minting facilities of their own. The mint service is charged with safeguarding of the government's huge values in gold and silver, running into billions of dollars. All medals for the navy, coast guard and marines are made in the mint at Philadelphia, and many for the army; also historic medals and special medals authorized by congress.

From the opening of the mint in 1792 through the calendar year 1946, 33,600,000,000 coins were produced; of this amount 28,600,000,000 were domestic and 5,000,000,000 were manufactured for foreign governments.

During 1946, 2,200,000,000 United States coins were produced. In addition, more than 500,000,000 coins were produced for the governments of Colombia, Cuba, Ecuador, Ethiopia, the Netherlands Indies, Philippines, Saudi Arabia and Venezuela. Domestic coinage by denominations for the calendar year, 1946, follows:

	Pieces	Face Value
Half dollars	19,794,095	\$ 9,897,047.50
Quarter dollars	66,712,800	16,678,200.00
Dimes	344,193,500	34,419,350.00
Five-cent pieces	219,968,200	10,998,410.00
One-cent pieces	1,505,445,000	15,054,450.00
	2,156,113,595	\$87,047,457.50

The new design Roosevelt dime was released on Jan. 30, 1946, the former president's birthday. Commemorative coins authorized by the congress and struck in 1946 were the Iowa Centennial and the Booker T. Washington half dollars. (L. Ho.)

Coke. The salient data on the production of by-product and beehive coke in the United States during the war years are given in the table on p. 223.

As is indicated by these figures, the chief cause of the greater demand for coke was the need for more pig iron. Following a consistent rise in the early years, production began to lag in 1945, but did not drop heavily even after the close of the war, until forced down by the steel and coal strikes early in 1946. Production in the first three-quarters of 1946 included 38,407,125 tons of by-product and 3,077,041 tons of beehive coke, a total of 41,484,166 tons, as compared with 52,339,100 tons in

Coke Production in U.S., 1940-45

(In thousands of short tons)

	1940	1941	1942	1943	1944	1945
Production	57,072	65,187	70,569	71,676	74,038	67,308
By-product	54,014	58,482	62,295	63,743	67,065	62,094
Beehive	3,058	6,704	8,274	7,933	6,973	5,214
Breeze made	4,165	4,555	4,752	4,941	5,116	4,721
Coal charged	81,386	93,138	100,850	102,460	105,296	95,672
Consumption, total	57,026	64,944	70,107	71,407	72,971	66,074
By iron furnaces	41,839	49,470	54,695	56,701	57,072	50,653

the same period of 1945. It was thought that with normal production during the remainder of the year, the total would approach 60,000,000 tons, but the figure was expected to be reduced by the coal strike that began late in November.

In Canada the production of coke dropped from 4,001,563 short tons in 1944 to 3,862,451 tons in 1945, and continued to decline to 2,207,000 tons in the first eight months of 1946, as compared with 2,638,000 tons in the same period of 1945. These figures include breeze and gas retort coke which, on the average, amount to about one-sixth of the oven coke output.

(G. A. Ro.)

Cold, Common.

During 1946 efforts were continued to find methods of preventing the spread of the common cold and similar respiratory diseases. Because of the crowding inevitably associated with military installations, most of the reports came from studies of military groups. During an epidemic of respiratory disease similar to the common cold there were fewer cases of infection among men living in barracks equipped with double bunks than in those barracks with single bunks. The effect of partitioning barracks was studied at a large naval training station where partial compartmentation was obtained with wooden and cloth partitions without apparent effect on reducing respiratory illness.

Applying oil both to floors and to blankets in barracks to cut down on the dust was found to be effective in controlling the degree of bacterial contamination of the air. This method probably is not applicable to ordinary living quarters in houses or apartments. Additional reports appeared on the effect of giving small doses of the sulfonamides over prolonged periods of time. In one such study a small dose of sulfadiazine was administered daily to about 20,000 soldiers for a period of 5 weeks. During this period the hospital admissions (and all those who developed symptoms were admitted to the hospital) for common respiratory diseases dropped one-third by the end of the first week. Probably the use of sulfadiazine in this way, except under special circumstances such as unusual crowding, should not be recommended for the population at large.

A large-scale experiment in England with an oral vaccine against the bacterial infections accompanying the common cold failed to show evidence of value. This conformed with the conservative opinion which had previously been expressed in the United States. One physician said that colds could not be eradicated by the efforts of single groups of scientists working in isolation. The common cold contains too many diverse factors for any one individual to solve.

Several methods of treating the common cold, related respiratory infections or their complications were studied. A Swedish report dealt with the use of sulfathiazole applied locally for certain acute cases of rhinitis (inflammation of the nose) and sinusitis. Improvement was obtained in some of the cases but not in all. Penicillin in the form of a fine spray, technically called an aerosol, was attempted in the treatment of both the ordinary cold and more serious respiratory infections. In most cases aerosols were used for the more serious conditions, such as bronchitis and sinusitis, in which some favourable results were obtained. Unfortunately, there was little reason to believe that penicillin in spray form is of much value in the early stages of

the common cold.

Colombia.

A republic situated in northwestern South America adjoining the Isthmus of Panama. It is the only South American country with both Caribbean and Pacific coastlines. Area: 439,714 sq.mi.; pop. (official est. 1945) 10,701,816. Of the population 68% is classified as mixed-blood, 20% as white, 7% as Indian and 5% as Negro. Most of the inhabitants live in the highlands and mountain valleys of the interior. The capital is Bogotá, with a pop. (off. est. 1944) of 425,240. Other cities are Barranquilla (197,830), Bucaramanga (63,850), Cali (130,180), Cartagena (96,960), Cúcuta (70,050), Ibagué (76,190), Manizales (106,060), Medellín (211,560), Neiva (37,680), Pasto (58,450), Popayán (33,870), Santa Marta (40,040), and Tunja (24,570). Language: Spanish; religion, predominantly Roman Catholic. Presidents in 1946: Alberto Lleras Camargo and Mariano Ospina Pérez.

History.—Political developments during 1946 hinged on the crisis caused by a split in the ranks of the dominant Liberal party which resulted in the election of Colombia's first Conservative president after 1930. The administration partisans entered the presidential campaign with Dr. Gabriel Turbay as their candidate and the support of approximately half of the Liberals, most of the labour union members and all of the Democratic Socialists. The independent faction of the party selected a candidate of its own, Dr. Jorge Eliécer Gaitán, and obtained the support of the other half of the Liberals, the remaining minority of organized labour, and the small National Socialist party. Encouraged by this split in the dominant party, the Conservatives chose a candidate for the first time in 16 years, Mariano Ospina Pérez, a political moderate. In the election on May 5, Ospina Pérez polled approximately 550,000 votes to 450,000 for Turbay and 350,000 for Gaitán, and was accordingly declared president, succeeding the provisional chief-executive, Alberto Lleras Camargo. The latter returned to his seat in the senate.

The apparent Conservative victory was illusory, however, for the Liberals maintained 80 of the 131 seats in the chamber of deputies, 40 of the 73 senate seats and strong majorities in the national courts, departmental legislatures and municipal councils. The new vice-president, Carlos Arango Vélez, elected by the congress, was also a Liberal. Realizing his peculiar position, the new president determined to form a coalition cabinet and pursue a nonpartisan program.

The Liberals displayed no such a conciliatory policy, however, and Ospina Pérez laboured in vain from the time he took office, Aug. 7, for the next four months to form a durable bipartisan ministry. Twice the Liberal members of congress met in convention and voted to remain outside of the administration, but on Dec. 12 a third such meeting resulted in favour of participation, and on the same day the president formed a cabinet composed of six Liberals and six Conservatives.

In foreign affairs, Colombia rejected in January the proposal of Uruguay for collective intervention by the American states in the internal affairs of potentially dangerous nations of the hemisphere. In February a most-favoured-nation commercial agreement was made with Canada. During the United Nations controversy over the veto power, Colombia's security council

representative, Eduardo Zuleta Angel, espoused the small-state cause of opposing the special privilege. Antonio Rocha, the republic's representative on the governing board of the Pan American Union, was elected chairman of the board in November.

Notwithstanding the re-establishment of price controls in March and additional government restrictions on financial remittances abroad in April under the Lleras Camargo administration, inflation plagued the country throughout the year. The cost of living index (100 in Feb. 1937) was 187 in January, 200 in June and 213 in October. In the latter month, 12,000 oil workers struck for higher wages, and the strike spread to other industries. On Nov. 9 a general strike was called in Cali and other centres of the department of Valle, but complete paralysis of industry was averted by the government's imposition of martial law in that area. The administration also took over the distribution of oil and gasoline to prevent a national transportation breakdown.

Political and economic crises did not discourage industrial expansion during the year. The government itself invested heavily in highway, railroad and merchant marine development, and the National Institute of Electrical Development laid plans for increasing electrical power throughout the country from the existing capacity of 120,000 kw. to 650,000 kw. The building boom reached an all-time high with contracts during the first half of the year in Bogotá alone calling for construction amounting to 17,655,000 pesos (6,156,000 pesos for the same period of 1945). A movement was under way in November to establish a new 100,000-ton capacity iron and steel plant in the Río de la Paz region. The rayon industry, bidding for leadership of South American production, planned for the expansion of one mill, at Barranquilla, from an annual output of 1,400,000 kilos to 3,600,000 kilos and for the establishment of a new plant, at Medellín, with a capacity for 3,000,000 kilos.

Education.—Elementary instruction in the public schools is free and technically compulsory for children aged 7 to 14. In 1944, 10,788 primary schools reported enrolments totalling 698,561 students; 1,820 secondary and vocational schools, 120,570 students (128 primary and 260 intermediate schools not reporting). Six public universities had an enrolment of more than 5,500 students. There were two private universities.

Finance.—The monetary unit of Colombia is the peso, valued officially on Nov. 30, 1946, at 57.27 cents U.S. In August the preliminary budget for 1947 proposed expenditures amounting to approximately 244,000,000 pesos (174,000,000 pesos in 1946); ordinary revenues were estimated at 195,000,000 pesos. The fiscal deficit was over 20,000,000 pesos in October. On Sept. 30, gold bullion holdings by the Bank of the Republic totalled 248,842,497.42 pesos, while bank notes in circulation amounted to 217,828,065 pesos. The national debt as of May 31, 1946, was 269,129,235.30 pesos internal indebtedness, 420,279,960.58 pesos external.

Trade.—Imports for 1945 totalled 593,961 short tons valued at 281,182,399 pesos (389,307 tons at 174,666,836 pesos in 1944); exports amounted to 346,612 tons, at 246,175,441 pesos (305,723 tons at 227,135,836 pesos in 1944). Most of the trade was with the United States, which supplied approximately 64% of the imports and took about 62% of the exports. Coffee shipments for the quota year 1945-46 (July 1 to June 30) amounted to 5,433,000 bags of 132 lbs. each (4,458,000 bags for 1944-45). Petroleum exports in 1945 totalled 19,542,689 bbls. (approximately 18,561,000 bbls. in 1944). Platinum exportation, restricted during World War II, was resumed during 1946.

Communications.—Railway trackage measured 2,056 mi. in 1945. There were about 7,700 mi. of improved highway and 35,000 mi. of unimproved roads. The first road linking Bogotá with the Caribbean coast was completed in Oct. 1946, with Santa

Marta as the terminus. Registered motor vehicles in 1944 included 16,955 automobiles, 3,960 buses and 9,407 trucks. Plans were made during 1946 for the unification of the national air and merchant marine services with those of Venezuela and Ecuador.

In 1944 there were 23,146 mi. of telegraph and 112,027 mi. of telephone lines, exclusive of municipal services. In 1946 there were 112 private radio broadcasting stations in addition to the national transmitter.

Agriculture.—The basic industry of Colombia is agriculture, with coffee as the main export crop. Coffee production during the 1945-46 crop year amounted to 5,478,000 bags. Other major crops (with 1944 production figures) are: cacao (8,607,600 kg.), copra (4,164,964 kg.), cotton (5,731,000 kg.), cotton seed (9,289,000 kg.), rice (116,280,000 kg.), sesame (1,264,700 kg.), sugar (73,848,800 kg.), wheat (50,900,000 kg.). The wheat harvest was down 10% in 1945. The cotton crop for 1946 was estimated at 7,877,778 kg. In 1945 the country's livestock included approximately 12,334,000 cattle, 1,000,000 sheep, 2,500,000 hogs and 630,000 goats.

Mineral Production.—The chief extractive industries (with 1944 production figures) are: petroleum (22,290,542 bbls.), gold (553,531 fine oz.), silver (197,318 fine oz.), platinum (34,304 fine oz.), salt (133,453 metric tons), and cement (273,694 metric tons).

Petroleum production in 1945 amounted to 22,824,890 bbls., and during the first 5 months of 1946 production was up 10%. Gold production dropped 17% in the same period.

BIBLIOGRAPHY.—J. M. Henao and G. Arrubla, *A History of Colombia* (transl. by J. F. Rippy, 1938); Periodicals: *Foreign Commerce Weekly*; *Revista del Banco de la República* (Bogotá); *Anuario General de Estadística* (Bogotá); *Inter-American*; *Hispano-Americano* (Mexico City). (M. L. M.)

Colorado. A Rocky mountain state of the United States, in the west-central part; mean elevation above sea level, 6,800 ft., the highest of any state. Admitted to the union in 1876 as the 38th state and known as the "Centennial state." Area 104,247 sq.mi., including 280 sq.mi. of water surface. The U.S. owns 34.5% of the total land area and 59.3% is in private ownership, the remainder belonging to state, county and municipal governments.

The central and western portions are mountainous and the eastern half consists of rolling plains.

Population (1940) 1,123,296; 52.6% urban, 47.4% rural; 93.6% native, 6.4% foreign-born; white 98.5%, Negro 1.1%, other .4%; 102.6 males per 100 females. The 1940 census reported 2,734 Japanese, the largest in number of all races other than white and Negroes. On July 1, 1946, the bureau of census estimated the civilian pop. at 1,213,914. Capital, Denver (1940 census, 322,412) 1946 est., 412,000; other cities, Pueblo (52,162) 1946 est. 63,000; Colorado Springs (36,789) 1946 est. 46,000; Greeley (15,995) 1946 est. 18,000.

History.—The 35th general assembly (1945) repealed the state service tax and enacted a local government budget, an occupational disease law, created a state institutional board and a fund of \$100,000 for industrial research development. No regular legislative session was held in 1946. A regular session was to be held in 1947. As a result of the 1946 elections, the following state officers were chosen: governor, William Lee Knous (Dem.); lieutenant governor, Homer Pearson (Rep.); secretary of state, Walter F. Morrison (Rep.); treasurer, H. Rodney Anderson (Rep.); auditor, Homer F. Bedford (Dem.); attorney general, H. Lawrence Hinkley (Rep.); superintendent of public schools, Nettie Fried (Rep.); representatives, John A. Carroll (Dem.), William S. Hill (Rep.), Robert F. Rockwell (Rep.), J. Edgar Chenowith (Rep.).

Education.—Under the minimum educational program for the state, about \$3,000,000 in state revenue was to be appropriated to the public schools on an equalization basis to aid in the support of minimum classroom units of 1,800 each. Three-fourths of these revenues must go to teachers' salaries, thus in effect establishing a teachers' minimum annual salary of \$1,350 in most schools.

On Sept. 1, 1946, the number of school districts had been reduced to 1,821. All consolidations in Colorado are on a voluntary basis.

It was estimated that the public elementary and secondary schools in Colorado would receive about \$28,000,000 during 1947. This compares with receipts of about \$26,500,000 in 1945. About 17% of this sum was to be provided by the state government, the remainder furnished by the local and county units. The cost of education per pupil in average daily attendance would be about \$150 per year, as compared with \$130 in 1945.

The school population, a census covering the 6 through 20 age group, showed an increase for 1946, climbing to 297,281 as compared with 289,167 in 1945.

Social Insurance and Assistance, Public Welfare and Related Programs.—Public welfare disbursements in 1945 amounted to \$27,087,243.89; pensions, 41,000 persons more than 60 received an average monthly payment of \$41.50, with an annual "Jack Pot" payment in Jan. 1946. This bonus amounted to \$79.13 to each person eligible to receive a pension. Total amount of pensions paid in 1945, \$22,053,356.44; dependent children 11,000, \$1,410,218.76; blind 441, \$171,036.25; administration \$850,896.53. The federal share of the above programs totalled \$10,249,376.03. General assistance was \$954,856.86. Additional expenditures included tuberculosis assistance, \$105,732.80, to approximately 201 patients; miscellaneous services including child care, burials, distribution of surplus commodities, etc., \$59,828.44.

Communications.—The state highway system in 1945, including 3,891 mi. of federal aid primary and 1,982 mi. of federal aid secondary roads, totalled 12,399 mi.; city streets 3,491 mi.; county roads 36,176 mi.; other local roads 26,423 mi.; national forests 788 mi.; toll 8 mi.; total 79,285 miles. There were 24 railroads operating with 3,883 mi. of main line track; 56 designated airports and landing fields, and 4 army air fields; 273,879 telephones were in use.

Banking and Finance.—As of Dec. 31, 1945, there were 77 national banks and 64 state banks. Deposits in all banks reached an all-time high at the close of 1945, amounting to \$1,096,068,000. Clearing in Denver, Pueblo and Colorado Springs aggregated \$3,532,958,426, an increase of nearly 7% over 1944. State finances were in an excellent condition in 1946 resulting from increased revenue and economy in administration. The unexpended balance in the treasury on June 30, 1946, was \$42,255,744.71, the largest on record. General revenue in the fiscal year of 1946 was \$82,507,982.42. All expenditures,

GOV. WILLIAM LEE KNOUS of Colorado, Democrat, was elected on Nov. 5, 1946

including functional services, debt services and transfers amounted to \$74,720,747.96. Debts—bonded, \$898,000.00; anticipation warrants, \$13,952,676.73; warrants—cash and general revenue, \$2,536,974.06. Investments, \$24,362,222.05. Investments of \$24,362,222.05 plus unexpended balance June 30, 1946, of \$42,255,744.71 made a total of \$66,617,966.76 liquid assets.

Agriculture.—Agriculture in 1946 was in an especially prosperous condition. Indicated final figures were expected to show an all-time high in receipts from the marketing of crops, livestock and livestock products of approximately \$600,000,000. New production records were established for 1946. Hay and roughage were ahead of 1945 and the ten-year average and the crops of potatoes and beans were unusually large. Sugar beets harvested yielded 2,336,000 tons, a 30% increase over 1945. Farm wages were at a record high during the entire year. Livestock and livestock products sold were expected to average \$190,000,000. Poultry and poultry products, \$7,000,000.

Table I.—Leading Agriculture Products of Colorado, 1946

Colorado marketed \$18,000,000 worth of farm truck crops through the Marketing Agencies and Marketing act. Prices received by farmers for farm products in 1946 were from 40% on fruits and vegetables to 140% on bean products higher than in 1945.

Manufacturing.—Colorado ranks high among the states in the manufacture of many commodities: beet sugar, chemicals, cement, coke, rubber products, mining machinery—in which Colorado is a leader in the world—canned fruits, vegetables, coffee roasting and grinding.

Mineral Production.—Mining is Colorado's chief industry. It is a major gold producing state and untouched treasures of essential metals are in its mountains. Of the world's supply of

Table II.—Mineral Production of Colorado, 1945 and 1944

	Value 1945	Value 1944
Gold—placer and lode	\$3,532,725	\$3,900,925
Silver.	1,583,488	1,599,168

Lead.	2,931,568	2,831,680
Zinc.	8,227,790	9,109,740

vanadium 90% is produced by Colorado, and the state leads the entire world in the production of molybdenum. The production of coal in Colorado was 7,653,979 tons in 1945 compared with 8,110,000 tons in 1944.

(P. Ae.)

Colorado, University of. Enrolment reached a new peak in 1946 with 7,700 students on the Boulder campus, 500 in the medical and nursing schools in Denver, 2,200 in extension classes in Denver and other Colorado cities, and 5,000 studying by correspondence. More than half of the students were veterans. Trailers, quonset huts and army barracks were installed on the campus for emergency housing for veterans. Construction began on more than \$2,000,000 worth of new dormitories to provide rooms for 730 single students and apartments for 94 couples.

Dr. Carl W. Borgmann was appointed co-ordinator of research to supervise approximately 100 research projects being conducted on the Boulder campus and at the school of medicine.

In Sept. 1946 the university announced a new commercial process for extracting levulose from sugar. The work was done under a grant from the Sugar Research foundation.

The observatory at Climax, Colo., established by Harvard university for high altitude coronagraph studies, was incorporated as the High Altitude Observatory of Harvard University and the University of Colorado.

University wartime naval units, including the special oriental languages training unit which trained thousands of officers and men, were disbanded during 1946. A peacetime naval reserve officers training program was re-established. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (R. L. St.)

Columbia, District of: see WASHINGTON, D.C.

Columbia University. An institution of higher learning in New York city. The budget appropriation for 1945-46 was \$16,819,167.50. Dr. Frank D. Fackenthal continued to serve as acting president through the year 1946. The main university library building, known as South Hall from the time of its opening in 1935, was named the Nicholas Murray Butler library, in honour of the president emeritus. Three sessions of the American Press institute, founded as a part of the graduate school of journalism in September, were held; seminars of two to four weeks were given for practising newspapermen. *A College Program in Action*, the report on the Columbia college curriculum, was published in 1946. In the fall of 1946 there were 14,371 veterans enrolled at Columbia. Some of these were housed as far away as Shanks Village in Rockland county (married couples) and North Brother Island in the East river (single men). (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (M. H. T.)

Columbium. Production of columbium ores in the United States dropped from 5,771 lb. in 1943 to 3,208 lb. in 1944, and 1,149 lb. in 1945, while imports in the same years increased from 1,191 short tons to 1,842 tons, and 2,139 tons, almost entirely from Nigeria. Increased supplies and decreased demand permitted relaxation of controls. The principal use is as an addition to stainless steels for improved corrosion resistance for parts to withstand high temperatures; although this use was well established prior to World War II, it found new applications in superchargers for aeroplane engines, in gas turbines and in jet propulsion motors. (G. A. Ro.)

Combined Chiefs of Staff, The. The establishment of the combined chiefs of staff by the governments of the United States and Great Britain was announced on Feb. 6, 1942. The four U.S. members were known as the "Joint United States Chiefs of Staff" and consisted of the chief of staff to the commander in chief of the army and navy; the chief of staff, U.S. army; the chief of naval operations; and the commanding general, army air forces. The four British members were known as "Representatives of the British Chiefs of Staff." They consisted of the head of the British joint staff mission in Washington and representatives of the first lord of the admiralty, the chief of the imperial general staff and the chief of the air staff.

Supporting committees were established to combine and co-ordinate all the factors of military intelligence, transportation, munitions, staff planning, meteorology and communications. A combined secretariat was set up to perform the necessary secre-

tariat work for the combined chiefs of staff.

The combined chiefs of staff were charged under the direction of the president of the United States and the prime minister of Great Britain with collaborating in the formation and execution of policies and plans concerning the strategical conduct of the war, the broad program of war requirements and allotment of munitions resources, and the requirements for overseas transportation for the fighting forces of the United Nations.

During 1946 the combined chiefs of staff considered matters deriving from the wartime co-operation of Great Britain and the United States. (A. J. Md.)

Commission on a Just and Durable Peace.

The Commission on a Just and Durable Peace instituted by the Federal Council of the Churches of Christ in America developed its work on the churches' strategy for world order. The general program for the postwar period, entitled "Christian Action on Four Fronts for Peace," was set forth by the commission at its annual meeting in Nov. 1945. In line with this general postwar strategy, the commission prepared a draft statement on world order which was subsequently adopted by the federal council at its special meeting in Columbus, O., March 5-7, 1946. This statement, entitled "The Churches and World Order," applied the general principles previously agreed upon to the specific issues confronting the United States in its foreign policy, its relations to the United Nations and its role in the peace settlements. The statement also dealt with the underlying spiritual crisis of mankind and the resources available for the task. Educational material based on this statement was prepared for church discussion groups across the country.

During the spring and summer of 1946, the commission was charged with the preparation of the first international conference of churchmen on world order after the end of World War II. This conference, meeting in Cambridge, England, Aug. 4-7, 1946, fashioned the charter of a new Commission of the Churches on International Affairs to carry on internationally functions similar to those assigned in the United States to the Commission on a Just and Durable Peace.

Another major undertaking of the commission during the summer and fall was an intensive study of tensions between the soviet and western worlds, eventuating in the statement on "Soviet-American Relations," which was adopted unanimously by the federal council's executive committee at its special meeting on Oct. 11. This statement, which invoked widespread public interest, formed a key document in the continuing educational work of the churches on problems of world order.

(Rt. M. F.)

Committee for Economic Development.

The Committee for Economic Development, formed late in 1942 by U.S. businessmen to plan during World War II for more production and more peacetime employment after victory than the U.S. ever had known, continued and expanded its program of economic research in 1946.

Originally C.E.D. set up two divisions to help reach its objective. One was its field development division, formed to stimulate planning at the grass roots for quick reconversion and high

peacetime production. The national field development helped organize 2,900 local Committees for Economic Development, with 70,000 business men serving as volunteer members.

The other, the research division, sought through objective study to determine what policies of government, business, labour and agriculture would contribute best toward the attainment and later the maintenance of high national levels of peacetime production and employment.

Early in 1946, six months after final victory, work of the field development division was terminated, its task having been largely completed. Reports from nearly 1,000 communities, gathered shortly before this termination took place, indicated speedy reconversion was assured in these areas as a result of company by company, community by community planning.

While this community work was being done, a special C.E.D. marketing committee was obtaining from more than 2,000 manufacturers and trade associations estimates of their postwar output of peacetime goods. These reports indicated that U.S. manufacturers would produce 30% to 45% more peacetime goods than in 1939, the year of the previous peak output.

On the basis of these studies C.E.D. was able to report to President Harry S. Truman in Sept. 1945, that within 12 months the United States would have 57,000,000 gainfully employed workers, and that no prolonged period of serious unemployment was to be expected during the transition. The accuracy of this report was shown just one year later when the U.S. census bureau reported there were then 58,370,000 such workers.

Up to the end of 1946, ten statements on national policy were produced and distributed by the Research and Policy committee. These statements and the date of their issue follow:

Postwar Employment and the Settlement of Terminated War Contracts (Oct. 1943); *Postwar Employment and the Liquidation of War Production* (July 1944); *Postwar Federal Tax Plan for High Employment* (Sept. 1944); *Postwar Employment and the Removal of Wartime Controls* (April 1945); *International Trade, Foreign Investment and Domestic Employment* (May 1945); *The Problem of Changeover Unemployment* (Aug. 1945); *Toward More Production, More Jobs and More Freedom* (Nov. 1945); *Agriculture in An Expanding Economy* (Dec. 1945); *The End of Price Control—How and When?* (April 1946); *Fiscal Policy to Fight Inflation* (Sept. 1946).

During the same period ten research reports also were completed. These statements and their authors follow:

The Liquidation of War Production, by A. D. H. Kaplan; *Demobilization of Wartime Economic Controls*, by John Maurice Clark; *Providing for Unemployed Workers in the Transition*, by Richard A. Lester; *Production, Jobs and Taxes*, by Harold M. Groves; *International Trade and Domestic Employment*, by Calvin B. Hoover; *Agriculture in an Unstable Economy*, by Theodore W. Schultz; *Jobs and Markets*, by six members of C.E.D. research staff; *Postwar Taxation and Economic Progress*, by Harold M. Groves; *Financing Business During the Transition*, by Charles C. Abbott and *Controlling World Trade—Cartels and Commodity Agreements*, by Edward S. Mason.

Most of the research reports and policy statements produced up to the end of 1946 dealt largely with problems of the transition. At that time there remained before the C.E.D. research division numerous incompleting assignments, studies of long range economic problems. Many representatives of government, business, agriculture, labour and the public urged that the research program be continued until these assignments could be completed. Therefore, the C.E.D. board of trustees, after careful consideration, agreed unanimously that the research program should be intensified and accelerated. At the close of the year studies were in progress in such long range problems as collective bargaining, small business, taxation, fiscal and monetary policies.

C.E.D. took two steps to meet the responsibilities of conducting such a program and making known the results of this research. One was to increase the membership of its national board of trustees from 26 to nearly 100. The other was to form a national Information committee, whose function is to bring to

the attention of interested individuals and groups the results of this program.

The board of trustees is the governing body of C.E.D. Paul G. Hoffman, president of the Studebaker corporation of South Bend, Ind., was chairman of the board from the date the committee was organized. Ralph E. Flanders of Springfield, Vt., served as chairman of the Research and Policy committee until he resigned in Jan. 1947, following his election as United States senator from Vermont. He was succeeded by Raymond Rubicam of New York, co-founder and, until he retired, chairman of the board of the Young and Rubicam advertising agency. Sumner Slichter, Lamont professor of Harvard university, was chairman of the Research Advisory board.

Walter Fuller, president of the Curtis Publishing company of Philadelphia, was chosen as chairman of the national Information committee when it was formed in 1946.

Officers of the corporation during 1946 were: executive director, Henry R. Johnston; research director, Theodore O. Yntema, professor on leave from the University of Chicago; director of information, John H. Van Deventer and secretary, E. H. Walker.

C.E.D. is supported entirely by voluntary contributions from hundreds of business concerns. It has no relation whatever to any agency of government nor to any private business organization. It maintains offices in Washington, D.C., in Chicago and in New York. The address in the latter city is 285 Madison avenue, New York 17, N.Y. (P. G. H.)

Communism, a world-wide and closely integrated movement of revolutionary Marxism with Moscow and the soviet union as its centre of inspiration and direction. In the year 1946 communist movements everywhere combined an appeal to local nationalism with a uniform line of a violent rejection of all noncommunist attitudes as "reactionary," "imperialist" or "semi-fascist." Only the communist approach—and that meant the approach demanded by the Kremlin—was regarded as "democratic" and conducive to peace.

The Communist party in the soviet union put a renewed stress on the Leninist-Stalinist ideology. The "breathing spell" granted under the stress of World War II when the rigidity of the party line was temporarily relaxed, came to an abrupt end. In literature and in the arts, in the press and in the schools the strictest supervision and repeated purges enforced an iron conformism. At the same time movements for greater national and cultural freedom of the various nationalities of the soviet union, especially of the Ukrainians, the second most numerous nationality within the vast soviet empire, were ruthlessly suppressed. In spite of this emphasis on party line and party discipline, the Kremlin continued to make use of the emotional appeal to religious and race loyalties of the Russian Orthodox Church and of pan-Slavism. For the first time a systematic attempt was made to organize people of the Orthodox faith and especially of Slav race who were citizens of non-Slav states for support of, and loyalty to, the pan-Slav cause which was identified with communist and Russian leadership. This appeal to Slav racial loyalties was especially directed to the large communities of Slav descent in the United States, in Canada and in Latin America.

During 1946 the Communist parties were dominant in all the Slav nations outside the soviet union, in Yugoslavia, Bulgaria,

ITALIAN COMMUNISTS parading in Rome in 1946

Poland and in Czechoslovakia. They were also in control in Albania and Rumania. In other European countries the communists showed great strength in France and in Italy, while their number was negligible in Great Britain. They tried everywhere to co-ordinate the policy of the Socialist party with their own and to form a workers' front under communist inspiration and direction. They succeeded in this in the Russian-occupied zone in Germany where they formed with the Socialists the "Socialist Unity party of Germany" with its slogan, "Unity of the working class, Unity of the People, Unity of Germany." This communist-controlled party became one of the strongest spokesmen for German unity and German national renaissance, and against any cession of German territory (except to Russia or Russian controlled Poland) and against any federalization or other weakening of a strictly unified Germany. Many of the Socialists in the Russian zone were forced into this unity whose leaders became Wilhelm Pieck of the Communists and Otto Grotewohl of the Socialists. Elections held in Berlin in all four zones in Nov. 1946 showed how weak this communist dominated Unity party was. Everywhere, including the Russian zone, the Socialists showed their great strength. This weakness of the Communists revealed itself in elections throughout Germany and in Austria.

In the western hemisphere the vigour and attraction of communist influence emerged in an official report submitted to the Canadian house of commons on July 15 by a commission appointed to investigate the facts and circumstances of the communication of confidential information to Russian agents. The report revealed the well-prepared and highly organized setup of the espionage network and the extent to which Canadians of important standing in science or administration were willing to supply secret information despite oaths of allegiance, of office and of secrecy.

In the United States the Communist party continued the line of strict class war ideology endorsed in July 1945. Earl Browder, the former secretary, was expelled from the party on Jan. 14, 1946, "for gross violation of party discipline, for developing factional activity and for betraying the principles of Marx-

ism-Leninism and deserting to the side of the class enemy, American monopoly capitalism." The party, it was declared officially, "will equip itself rapidly to become a mass party and more effectively perform its vanguard role today and in the great economic and political struggles which lie ahead." This hope was hardly fulfilled in 1946.

On the other hand communist influence grew in Latin America where it was supported by the activities of pan-Slav movements and by the Latin American Confederation of Labour (CTAL) under the leadership of Vicente Lombardo Toledano. Communist propaganda backed throughout the Russian line in hemispheric and world politics and sharply attacked the United States and "Yanqui imperialism." The largest Communist party was in strategic Brazil where it received more than 10% of the total votes in the Dec. 1945 elections and was especially strong in Rio de Janeiro, in São Paulo and in Pernambuco. In Cuba their Partido Socialista Popular dominated the Cuban Confederation of Labour and formed part of the coalition supporting the government. It was support by the communists which made the election of Gabriel González Videla as president of Chile possible; he rewarded them with three posts in the cabinet, the first time the communists attained cabinet rank anywhere in the western hemisphere. The communists in Chile controlled the vital mining unions there. The party showed also growing strength in Venezuela and in Argentina where by the end of the year it supported the government of President Juan Perón.

In Chile the Socialists are strictly opposed to communism. Their leader Bernado Ibanez charged on Dec. 25, 1946, that communism is out to dominate world labour, "using methods of coercion perhaps worse than those the nazis used to dominate Europe." In a letter to Vicente Lombardo Toledano he rejected the collaboration between Socialists and Communists decided upon by a meeting of the executive council of the Latin American Confederation of Labour in Costa Rica.

The leader of the Brazilian Communist party Luis Carlos Prestes declared that in case of a conflict between the U.S.S.R. and the United States the Latin-American communists would revolt against their own governments should these decide to support the United States.

Communist influence was often the driving force behind the nationalist movements in Indo-China, the Netherlands Indies and Burma, where the party supplied some of the outstanding leaders. In the near east, Syria and the Lebanon had become centres of Communist propaganda, in Syria under Khalid Baghdadash, a Mohammedan of Kurdish descent who was trained in Moscow; in Lebanon under Mustapha el Ariss, the chairman of the Lebanese Federation of Labour, a native Christian and a printer by trade. In Palestine communist influence among Arab workers was growing in 1946; it did not do so among Jewish workers because of the hostility of soviet authorities to Zionism. The Arab communists in Palestine were organized as the Arab League for National Liberation with its centre in Haifa under the leadership of Boulus Farah. In Egypt the government arrested communist leaders who were to be found mostly among young intellectuals, and scientists and suspended communist activities and propaganda.

Communism in China remained very strong in 1946. The Chinese Communist party with Mao Tse-tung as leader and Yen-an as its centre claimed a membership of about 2,000,000. Its strength is based on its disciplined unity and its program of reform. While the party "at present" struggles for a "democratic" China, its final goal is to bring the communist system to China with the works of Marx and Lenin as the guiding compass of the party's work. The Chinese communists like all other communists fit their own policy closely to the Moscow party line. The official communist statements in China at the end of 1946 were especially violent in their attack upon the United States. Leader Mao declared: "The American economic crisis will arrive this year or next. It will certainly deepen the contradiction between world democracy (which means communism) and anti-democracy (which means America). It will promote the formation of a world-wide democratic united movement. American imperialism will never again attain economic prosperity after the next economic crisis and therefore the American imperialists will not for long be riding as high, wide and handsome." In the proclamation the impression was created that the entire world was swinging into line against "imperialistic America." In north Korea under Russian occupation the Communist party, titling itself "democratic forces," assumed complete control of the economic, religious and cultural life. In south Korea and in Japan the Communist party carried on a lively agitation, directed above all against the U.S. methods of occupation. The leader of Japanese communism was Kyuichi Tokuda; the party newspaper *Akahata* (Red Flag) had a circulation of more than 300,000.

Internationally the influence of communism was spread by a number of organizations and congresses, not directly connected with Communist parties. These organizations were especially active in the fields of labour where they found a central organization in the World Federation of Trade Unions established in Paris in the fall of 1945, of students, of youth and of women. (See also DEMOCRACY; FASCISM; SOCIALISM; WORLD FEDERATION OF TRADE UNIONS.)

Community Chest.

The community chest is the name given to a local federation made up of social service agencies and individuals, the purpose of which is to promote joint planning for voluntary health and welfare services in the community and to raise by a united annual campaign the funds for their support.

Community Chests and Councils, Inc., was organized in Feb. 1918 as the national association of local community chests and councils of social agencies. It is a clearing house of information and ideas for its members and provides them with many serv-

ices in the fields of health and welfare planning and fund raising.

During World War II, the great majority of community chests extended their scope to become "Community and War Chests." Community Chests and Councils, Inc., was active in helping to establish the National War Fund, Inc., a wartime campaign headquarters organization for all united campaigns for war relief services. The National War Fund campaigns covered not only chest cities but also communities where no chests existed.

Of the 1,182 community chests and councils of social agencies in operation in Aug. 1946 (852 chests and 330 councils), 811 chests and 308 councils were in continental U.S.; 4 chests and 2 councils in Hawaii; 34 chests and 19 councils in Canada; 2 chests in South Africa; 1 chest in the Virgin Islands; and 1 council in the British West Indies. Almost every city in the U.S. (except New York city, which has a limited joint financing organization) in 1946 had a community chest or similar plan of federated financing for its voluntary social services. In 852 cities in 1945 more than 20,000,000 contributions totalling \$197,048,839, were given to community chests to be used during 1946 for voluntary social work in their communities and for National War Fund agencies. In 1946, following the liquidation of the National War Fund, the chest campaigns were united under the name "The Community Chests of America," using the national symbol of the Red Feather and the slogan, "Everybody Benefits—Everybody Gives."

Officers of Community Chests and Councils, Inc., for 1946 were: honorary president, Gerard Swope, New York city; president, E. A. Roberts, Philadelphia, Pa.; vice-presidents, J. B. Adoue, Jr., Dallas, Texas, H. L. R. Emmet, Erie, Pa., Philip Morgan, Worcester, Mass., Mrs. Henry P. Russell, San Francisco, Calif.; treasurer, Milton H. Glover, Hartford, Conn.; secretary, Robert P. Lane, New York city. Ralph H. Blanchard was executive director. The address of the association was 155 East 44th St., New York 17, N.Y. (See also RELIEF.) (B. A.)

Community Trusts.

Upward of \$75,000,000 had been accumulated at the close of 1946 for philanthropic uses by 75 community foundations in the United States and Canada. Their resources had increased by more than \$8,000,000 during the year and their current charitable expenditures had risen to a level in excess of \$2,000,000 annually.

The first community trust was established at Cleveland, O., in 1914. Its purpose was to provide a framework for the effective administration of multiple charitable funds, small as well as large. Power was vested in a central committee of the trust to amend the objectives of any particular fund if adherence to its original uses became impossible or impracticable in the course of time. By centring the fiscal management of funds in fiduciary institutions while vesting control over disbursements in a distributing committee of which a majority is appointed from public sources, the trust sought to achieve what Gen. L. P. Ayres termed "a business control of investments and a social control of expenditures."

The New York Community trust with \$17,090,000 and the Chicago Community trust with \$12,274,000 are the largest of these community foundations. The Cleveland foundation lists resources of \$9,607,000; the Boston Permanent Charity fund, \$5,994,000; and the California Community foundation, \$4,194,000.

Out of cumulative disbursements of \$2,021,000 in 1945, New York city appropriated \$567,000; Chicago, \$351,000; Cleveland, \$253,000; and Boston, \$250,000. Of incoming gifts to community foundations in that year, receipts in Cleveland were \$1,030,000; in Hartford, \$848,000; in Chicago, \$776,000 and in

Kalamazoo, \$586,000.

Among the latest created community foundations were those in Mt. Vernon, O.; Wilmington, N.C.; and Rochester, Minn. (R. Hs.)

Congregational Christian Churches. The Congregational Christian Church of the United States represents a union (1931) of the Congregational Church, established 1620, and the Christian Churches, founded after the American Revolution. The churches numbered 5,836 in 1946, organized in 51 conferences, with a membership of 1,130,824. They are community institutions with no restrictions of race, creed or station, and each church elects its own minister and officers and writes its own covenant. During 1946, total contributions received for home expenses were \$19,301,495; for benevolences, \$3,951,495; 2,140 churches were rebuilt or repaired at a cost of \$4,415,658; total property value was \$171,892,927. National headquarters: 287 Fourth Ave., New York 10, N. Y. (*See also* CHURCH MEMBERSHIP.)

Congress, United States. The 80th U.S. Congress convened for its first session on Jan. 3, 1947. It comprised the following members (as of Jan. 3, 1947):

United States Senate

¹Vacancy caused by the death of Robert K. Henry, Nov. 20, 1946.

Congress of Industrial Organizations. In 1946 the C.I.O. welcomed home more than 2,000,000 of its 6,300,000 members who had served in the armed forces during World War II. The returnees played a prominent part in advancing the C.I.O. wage and full employment programs.

The leadership given by the C.I.O. in the drive for prompt reconversion of industry to peacetime production was a chief factor in maintaining 58,000,000 jobs for U.S. workers during the year. In addition to furthering its formulas for full production, full employment and full consumption, the C.I.O. consolidated its existing membership and renewed its drive to extend

organization of the unorganized workers. The C.I.O. Organizing committee in the south established headquarters in Atlanta, Ga. There were 250 veteran organizers assigned to the 12 southern states. More than \$2,000,000 was subscribed and pledged by all 40 C.I.O. International unions to carry on the work in the south.

The C.I.O. resumed its practice of holding annual conventions and assembled in Atlantic City, N.J., Nov. 18 to 23. In view of the abandonment of price control by the federal government and a consequent sharp increase in the cost of living, the convention declared that substantial wage increases were necessary to provide necessities, to sustain purchasing power, and ultimately to prevent another depression.

An outstanding contribution to economic history was made by Robert R. Nathan Associates, Inc., in an analysis of factual data on wages and living costs compiled by all C.I.O. International unions. The Nathan analysis received extensive publicity that brought huge corporate profits into focus.

The C.I.O. sent three representatives to the meeting of the World Federation of Trade Unions executive bureau in Moscow in June. The C.I.O. insisted that the W.F.T.U. again request recognition by the Economic and Social Council of the United Nations. Subsequently the request was granted in part.

National C.I.O. headquarters were at 718 Jackson Place, N.W., Washington 6, D.C. National officers were Philip Murray, president; James B. Carey, secretary-treasurer.

(See also AMERICAN FEDERATION OF LABOR; LABOUR UNIONS; STRIKES AND LOCK-OUTS; UNITED STATES.) (P. My.)

Connally, Tom (Thomas Terry) (1877-), U.S. politician and statesman, was born Aug. 19, in McLennan county, Tex. He was graduated from Baylor university (1896) and from the University of Texas (1898) with an LL.B. degree. He served with the army in the Spanish-American War and World War I. He was elected to the U.S. senate in 1928, after having served in the house. In the early days of the Roosevelt presidency, Senator Connally gave qualified support to the domestic measures of the administration, but on foreign policy, his support of the administration was wholehearted. He became chairman of the senate's foreign relations committee in 1941.

Connally was one of the U.S. delegates to the United Nations conference in San Francisco in April-June 1945 and he was also a member of the U.S. delegation to the U.N. general assembly sessions in London (Jan.-Feb. 1946). The senator also accompanied Secretary James F. Byrnes to the Allied Council of Foreign Ministers that opened April 25, 1946, in Paris. He was again appointed July 18, 1946, as a member of the U.S. delegation to the U.N. and on Aug. 2, he was appointed to the permanent joint congressional committee on atomic energy.

Connally was re-elected to the senate, Nov. 5, 1946.

Connecticut. Next to the smallest of the New England states and one of the 13 original states, Connecticut is variously known as the "Nutmeg state," "Constitution state," or the "Land of Steady Habits." It is bounded on the north by Massachusetts, on the east by Rhode Island, on the south by Long Island sound, and on the west by New York. It is 5,009 sq.mi. in area of which 110 are water. The population, according to the 1940 census, was 1,709,242. The state registrar of vital statistics est. that as at July 1, 1946, this fig. had increased to 1,773,204. The same official reported for Hartford, capital and largest city, 167,636; New Haven 160,605; Bridgeport, 147,478; Waterbury, 99,314; New Britain, 69,035; and Stamford, 64,096.

History.—A special session of the legislature was held from May 7 to May 17, 1946. Ten public and nine special acts were

passed. Among these were several relating to veterans' housing. Five million dollars was appropriated from the Postwar Purposes fund, and the State Housing act was amended to permit the state to receive federal aid. A department of aeronautics was established in anticipation of the return to the state of several airfields which had been leased to the federal government during the war. An appropriation was made for salary and wage increases to state employees.

The November election resulted in a Republican landslide. A complete Republican state ticket, including U.S. senator, governor, lieutenant governor, secretary of the state, treasurer, comptroller, and all six congressmen was elected. In addition, Republicans gained control of the general assembly by electing 28 senators to the Democrats' 8, and by electing 231 Republicans in the house to the Democrats' 41.

The elective state officers for 1947 were: governor, James L. McConaughy (Rep.); lieutenant governor, James C. Shannon (Rep.); secretary of state, Mrs. Frances B. Redick (Rep.); treasurer, Joseph A. Adorno (Rep.); comptroller, Fred R. Zeller (Rep.); attorney general, Wm. C. Hadden (Rep.).

Education.—For the year 1945-46 there were 792 public elementary schools with 177,657 pupils and 4,759 teachers; 32 junior high schools with 17,008 pupils and 651 teachers; 93 high schools with 66,520 scholars and 2,398 teachers. The local expenditure for education was \$37,297,610 compared with \$34,694,300 the year before. The state maintained 4 teachers colleges with an enrolment of 1,156 students and a faculty of 115.

Veterans raised enrolment at the state university at Storrs to a 50% increase over any previous figure. The state leased the U.S. maritime school at Fort Trumbull, New London, which had accommodations for 2,000, and there were branches at Hartford and Waterbury for freshmen and sophomores.

Social Insurance and Assistance, Public Welfare and Related Programs.—The state welfare department reported that the total of all types receiving public assistance in June 1946 was 44,930 persons compared with 39,581 in June 1945, and that the cost in 1946 was \$1,536,505 compared with \$1,250,688 in 1945, both considerable increases. Types and numbers of persons receiving assistance were: general local relief, 8,999; old-age assistance, 14,689; in state institutions, 6,532; aid to dependent children, 9,464; county wards (6-18 years), 3,217; state wards (under 6 years), 1,837; aid to the blind, 192.

Communications.—For the first ten months of 1946 the commissioner of motor vehicles reported a total of 542,194 motor vehicles registered and 618,683 operators' licenses issued including 72,216 free licenses to ex-service men. Although no figures for highway construction were available, more than 20 contracts for new construction had been let including the last link in the Wilbur Cross highway on which work was being concentrated.

There were 12 broadcasting stations in the state, an increase of one over 1945. There were 107 newspapers and periodicals being published. The state was served by 3 railway companies and 1 street railway company, 48 bus companies and 111 taxicab companies. There were 501,583 telephone outlets compared with 468,177 in 1945.

Banking and Finance.—The treasurer's report for the fiscal year ending June 30, 1946, shows the following: cash balance, July 1, 1945, \$35,431,571.87, cash receipts \$176,857,408.62, total \$212,288,980.49; disbursements \$188,644,470.10; cash balance, June 30, 1946, \$23,644,510.39.

The state's bonded debt was \$22,835,000, of which \$12,837,000 was funding and building bonds. There was in the Bond Retirement fund \$13,717,342. The balance of the bonded debt, \$9,998,000, represented bonds for bridge and dormitories.

Almost \$4,000,000 was added to the Postwar Purposes fund which amounted to \$16,231,831. The Unemployment Compensation fund deposited with the secretary of the U.S. treasury was \$171,111,916.

As at Sept. 30, 1946, the bank commissioner reported that the assets of the 72 mutual savings banks were \$1,343,986,227; that the assets of 62 state banks and trust companies were \$795,162,354.

The 50 national banks reported to the comptroller of currency that their assets as at June 30, 1946, were \$798,087,000. Thirty-three building and loan associations had assets of \$45,019,255.

Agriculture.—The cash farm income for 1945 was very satisfactory, the total being more than \$20,000,000 higher than in 1944, or \$122,966,000 as compared with \$101,140,000. The 1945 total was made up of income from crops, \$45,073,000, and income from livestock and

JAMES L. McCONAUGHY, elected governor of Connecticut on Nov. 5, 1946, on the Republican ticket

livestock products, \$77,893,000.

Manufacturing.—The cessation of the war and resulting cancellation of war contracts were a heavy blow to such a highly industrialized state as Connecticut. In June 1945, 585,278 persons were employed in 13,668 establishments in the state. In the first quarter of 1946 the corresponding figs. were 540,875 and 13,008. In Oct. 1945 the index of business activity was 118.4 and in Sept. 1946 it had risen to 148.3. The treasurer's report shows that the state revenue from the corporation tax yielded \$11,434,000 for the year ending June 30, 1945, and \$8,766,000 for the year ending June 30, 1946. In general it may be said that the shortages of material and skilled labour were the main retarding factors, and that strikes and shortages of housing aggravated the situation. (J. B.)

Conservative Party, Great Britain.

Winston Churchill and Lord Woolton (who joined the party only on the day of its defeat at the polls) were acclaimed, at the first conference of the party held out of London after 1939, leaders of a nation-wide campaign to retrieve its political fortunes. The conference was held at Blackpool on Oct. 3-5, 1946, and was attended by 2,700 delegates. Before it took place much interest had been roused by speeches in which Harold Macmillan and others had urged the formation of a united front by all opponents of the Socialist government and suggested that this might best be achieved if the name of the party were changed from Conservative to "Democratic." At the conference all resolutions to change the name were ruled out of order, but strong feelings were expressed against it. A motion urging party headquarters to take early steps for uniting all opposed to the Socialist government was overwhelmingly rejected in favour of an amendment to ensure that any steps to attract anti-Socialists into the party should be "consistent with the basic principles of Conservatism." Those principles were restated by Churchill in a speech in which, after declaring the political situation so grave that he was resolved to go forward in the Conservative leadership, he enumerated eight "main objectives": the upholding of the Christian religion; defense of the monarchical parliamentary constitution; security against external aggression and safety for sea-borne trade; maintenance of law and order; sound finance; development of empire trade; improvement of social conditions, and support of free enterprise and initiative against state trading and nationalization of industries.

It was Churchill who on July 1 had appointed Lord Woolton to succeed Ralph Asheton (resigned) as chairman of the party organization. Other changes in accordance with practice were made at the council meeting of the National Union of Conservative and Unionist associations in London in March. Oliver Stanley was then elected president in succession to Lord Courthope; Major R. G. Proby became chairman, replacing R. A. Butler, M.P., who was appointed chairman of a new central committee

Leading Agricultural Products of Connecticut, 1944 and 1945

Product	1944	1945
Apples	\$3,109,000	\$2,651,000
Truck Crops	5,618,000	5,558,000
Potatoes	6,245,000	5,346,000
Tobacco	5,489,000	22,725,000
Dairy products, including cattle and calves	32,169,000	33,751,000
Poultry, including eggs	32,469,000	37,064,000

on policy and political education. Mrs. Lorne Sayers was made chairman of a Women's Advisory council and Lieut. Colonel S. B. H. Oliver organizing secretary of the junior movement. It was reported at Blackpool that the number of branches of Young Conservatives had grown from 51 at the time of the general election to 834. New appointments at party headquarters were of Herbert Brabin as local government officer to assist candidates at local elections when these were fought on party lines; and of H. L. d'Aubigné Hopkinson, deputy British high commissioner in Italy from 1944-46, as head of the parliamentary secretariat. Tory Reform committee officers were Colonel C. G. Lancaster, chairman; Lieutenant Colonel D. Heathcoat-Amory, secretary; Major E. Gates, treasurer. Sir Arnold Gridley was chairman of the Conservative and Unionist Members (1922) committee. There was also set up a new central board of finance with Lord Llewellyn as chairman and Air Marshal F. H. M. Maynard as manager. It worked in collaboration with the party treasurer and the 12 regional area organizations co-ordinating and extending money-raising efforts above constituency level. A Conservative political centre with a bookshop attached was opened during the year at 58, Victoria St., London.

In the municipal elections of November, the Conservative party slightly increased its strength, but the Labour party took the majority of votes. The successes of both parties were at the expense of the Independents. (*See also* PARLIAMENT, HOUSES OF.) (L. DU.)

Consumer Credit. The year 1946 in the field of consumer credit in the U.S. was one of great expansion. In January the total consumer credit outstanding was estimated at \$6,448,000,000. Each month thereafter, this figure climbed and in October the figure was \$8,694,000,000. Indications were that the year-end total would be in excess of \$10,000,000,000.

This great increase can be attributed to numerous factors. Some of the most important are these:

The large volume of cash in the hands of the middle income groups decreased in volume. As more consumer goods came on the market and the nation converted from war to peacetime production, consumers began to open charge and instalment accounts rapidly. An even more important factor was the increased production of durable consumer goods, such as automobiles, refrigerators, household appliances, etc. These items normally purchased on instalment contracts helped to swell the total volume of consumer credit outstanding.

Buying had not yet become selective in the early months of 1946. In the sellers market that prevailed, many retail firms offered scarce goods as an inducement to secure new charge customers. The competition in the field of consumer credit extension became increasingly keen during 1946, and a number of institutions and businesses, not formerly interested in credit extension, began to engage in this activity.

Banks, for example, expanded their loan services to customers. The bank-agent auto plan is a case in point. Through the operation of this system, the banks financed automobile purchases directly in co-operation with independent insurance agents.

Other plans being evaluated at the year's end included such innovations as charge loan accounts and proposals for financing vacations, etc. The railroads, at the close of the year, were contemplating the establishment of a passenger credit service whereby travel could be billed on a monthly basis. The airlines already had such a system in operation and were actively promoting it.

Retail firms faced with the necessity of replacing the credit accounts lost during World War II were aggressively seeking

new credit customers. By the year's end, trained crews were soliciting new charge account business door-to-door in many cities. Scarce merchandise was offered as an inducement to establish charge accounts. Heavy advertising campaigns were directed at focusing consumers' attention to the conveniences of instalment and charge account buying.

Thousands of new family units were formed during the war through the increased marriage rate. These families, because of wartime shortages, had been unable to purchase the normal requirements for housekeeping. The heads of these families, normally servicemen, returned from the armed forces without large accumulations of cash. They were, therefore, immediately in the market for goods and were forced to seek credit accommodations in order to make their purchases.

To these factors must be added the lifting of restrictions of Regulation W, the war-time control measure defining how charge accounts and instalment credit would be paid. The extension of charge account credit was substantially freed from government control on Dec. 1, 1946. The extension of credit was made the responsibility of the individual firms and institutions concerned.

It is not to be inferred from this increase in the volume of credit outstanding and from the increasing promotional activities that the U.S. was embarked on an uncontrolled period of promiscuous credit extension. There was every indication that due care was being used in the selection of new credit accounts.

The principles of sound credit extension were made mandatory through the provisions of Regulation W. Credit granters had an opportunity to observe the advantages accruing from a conservative policy.

The Associated Credit Bureaus of America, a trade organization composed of more than 1,300 credit reporting offices throughout North America, indicated that the volume of credit inquiries received by its member affiliates was as much as 100% over the war years and 35% to 50% over a previous year, 1940.

The credit reports furnished by the various credit bureaus were used to disclose the paying habits of individuals applying for credit. It was apparent, therefore, that credit granters were interested in the financial responsibility, the character, the capital, and the capacity of the individual seeking credit. The desire for sales volume did not distort judgment in most cases.

Credit granters indicated that the dangers of uncontrolled credit extension were recognized. The general policies of retailers in the merchandising field indicates a cognizance of the dangers and an appreciation of their responsibilities.

(H. A. WE.)

Great Britain.—Consumer credit during 1946 did not reach prewar dimensions, owing to the fact that the amount of consumer goods being produced was still limited, and a considerable proportion of that production was appropriated to export. There had been abundance of cash in the country during the year, so that purchasers were quite prepared to pay cash for what they could obtain, and sellers were inclined to favour the cash purchaser rather than the hire purchaser. Furthermore, the government repealed only in a small way the control of prices legislation which during the war years made it practically impossible for consumer goods to be obtained on hire purchase.

Notwithstanding all this, the companies specializing in consumer credit finance were recovering from the war depression, although their investments were for the most part in contractors' plant, machine tools and other types of factory equipment.

Unlike the position among companies operating in the U.S.A. there had been until 1946 very little co-operation in Great

Britain among what were known as finance companies, *i.e.*, companies specializing in consumer credit finance. The result was that in this important group of companies, where the capital and borrowing capacity reached very considerable figures, there was no means by which they could speak with one voice, neither was there any particular organization to which the government could look for guidance and advice on any legislation which they contemplated in connection with hire purchase; and on the other hand the companies were not able to show a united front to the government when legislation was proposed which might react to their detriment. During the year the Finance Houses Association, Ltd., was formed; it comprised all the larger finance companies doing a business embracing all types of goods to which consumer credit finance could be applied. This new association under the presidency of J. Gibson Jarvie, the chairman of United Dominions Trust, Ltd., and with a very strong committee of hire-purchase experts, was warmly welcomed by banks, by the government and by every institution in the country which recognized the importance of this type of finance in the postwar reconstruction period. The association would be able to talk to the government with complete authority as the mouthpiece of every company in the country doing a general hire-purchase business on a large scale; in due course it would probably be able to furnish information and statistics of assistance in the study of consumer credit, and might in the future be the means of bringing some sort of uniformity to the system as regards methods, rates and terms. (D. CL.)

Contract Bridge. The most widely-played card game in the world, contract bridge, retained its popularity undiminished during 1946 and (judging by pertinent evidence) even increased its hold upon card players. Sales of playing cards designed for bridge use were even greater than in 1945, when they had reached a higher point than ever before. The same was true of sales of bridge instruction books.

Attendance at bridge tournaments, in which the more serious players compete, increased above 1945 or any previous year. In the U.S. and Canada, championship tournaments are conducted by the American Contract Bridge League. More than 15,000 players competed in sectional and national championship contests, and nearly 200,000 players per week played in local and club tournaments.

The standard of skill among U.S. bridge players showed improvement at the rapid rate which had been discernible during the past decade. No new systems of bidding became popular, most players using the Culbertson system as in former years.

During the war *The Bridge World*, published in New York, had been the only magazine devoted to the game, but during 1946 magazines were published also in England, Belgium, The Netherlands, Denmark and Sweden. During the 1930s there were at least 13 such magazines, not counting a dozen or more periodicals issued for their members by bridge-players' associations.

The winners of the principal championship tournaments played in the U.S. were:

Masters' Individual Championship.—Won by Robert McPherran, New York, N.Y.; second, Morrie Elis, New York, N.Y.; third, Ambrose Casner, New York, N.Y.

Masters' Pair Championship.—Won by Charles J. Solomon and Sidney Silodor, Philadelphia, Pa.

Masters' Team-of-four Championship.—Won by William Christian, Montgomery, Ala.; Capt. Mark Hodges, Dallas, Tex.; Mrs. Wilkinson Wagar, Atlanta, Ga.; Sol Mogal, New York, N.Y.

Open Team-of-four Championship.—Won by Howard Schenken, George Rapee and Samuel M. Stayman, New York, N.Y.; Oswald Jacoby, Dallas, Tex.; John Crawford, Philadelphia, Pa. The winners of this tournament receive also the Harold S. Vanderbilt cup.

Open Pair Championship.—Won by B. Jay Becker, New York, N.Y., and Sidney Silodor, Philadelphia, Pa.

Open Team-of-four Championship.—Won by Mrs. Erwin Seligman and

Alvin Roth, New York, N.Y.; John Crawford, Philadelphia, Pa., and A. Mitchell Barnes, Atlanta, Ga.

Men's Pair Championship.—Won by Waldemar von Zedtwitz, New York, N.Y., and A. Mitchell Barnes, Atlanta, Ga.

Women's Pair Championship.—Won by Mrs. Ralph C. Young, Philadelphia, Pa. and Mrs. Erwin Seligman, New York, N.Y.

Men's Team-of-four Championship.—Won by Arthur Glatt, Jules Bank, Albert Weiss, William McGhee and Maynard D. Adams, Chicago, Ill.

Women's Team-of-four Championship.—Won by Mrs. Helen Sobel, New York, N.Y.; Mrs. Ralph C. Young, Philadelphia, Pa.; Mrs. Emily Folline, Richmond, Va.; Mrs. Wilkinson Wagar, Atlanta, Ga.

The William E. McKenney trophy for the best tournament record of the year was won by Sidney Silodor of Philadelphia, Pa. (E. CUL.)

Great Britain and Europe.—Dormant throughout the war years, tournament bridge was more popular in Great Britain in 1946 than ever before. There was a record number of congresses (tournaments), eight having been held, and newspapers, despite the acute shortage of newsprint, gave space to reports of tournaments, weekly articles and problems. These appeared in *The Times*, the *London Star*, the *Daily Mail* and most of the more important provincial papers.

A new monthly bridge magazine, *Contract Bridge Journal*, came into being in September; it is the official organ of the English Bridge union.

Tournament bridge is governed by the British Bridge league, to which are affiliated the five self-governing unions: England, Scotland, Wales, Ireland and Northern Ireland.

The International Bridge league was re-established with a view to resumption of international contests in 1947. None had been held after 1937, when 11 countries competed. Unofficial team matches were played in Brussels between an English team and the champion team of the Belgium league (the English winning by a narrow margin), and in England between an English team and a Czech team three of whose members had tasted the horrors of a German concentration camp during the war.

The international championship in which England, Scotland, Wales, Ireland and Northern Ireland play 100 boards each against the others was won by England with three wins; Northern Ireland was second.

Capt. Ewart Kempson led the English team in its three victories.

The annual contest between North and South (of England) was won by the South team of Col. G. G. J. Walshe, M. Harrison Gray, S. J. Simon, J. Marx and N. Furse. Each team had won five times in this series, founded in 1932.

The Gold cup contest was won by Leo Baron's team, consisting of Baron, N. Squire, N. Goldinger, P. Juan, B. Shapiro and H. Leist.

The most popular bidding systems were Acol and the Two Club variation of the Culbertson system. The standard of play was no higher than it was before the war. (E. KN.)

Contract Terminations. Early in World War II, changes in terrain and tactics and the invention of new matériel necessitated the termination of war contracts for the government's convenience. Moreover, the cessation of hostilities in 1945 brought the termination of a vast majority of war contracts then outstanding. The far-reaching extent of the termination settlement program which resulted is made apparent from the fact that by Nov. 30, 1946, in the U.S. 319,000 contracts, involving cancelled commitments of \$65,400,000,000 which the government had entered into for war production purposes, had been terminated. At that date, 315,000 (99%) of these contracts, with cancelled commitments of \$60,300,000,000 (92%), had been settled for gross allowances of \$6,200,000,000.

Robert H. Hinckley, a vice-president of the Sperry Corp. and former assistant secretary of commerce for air, was appointed director of Office of Contract Settlement and assumed

his duties on July 28, 1944. On his retirement in the early part of 1946, Col. H. Chapman Rose, deputy director, became director. On Oct. 1, 1946, Roger L. Putnam, wartime deputy director of the OCS, assumed the duties of director. Executive order 9809 issued Dec. 12, 1946, transferred the functions of the OCS to the treasury department, and the functions of the director to the secretary of the treasury.

Prior to 1946, the OCS issued 20 regulations dealing with such matters as interim financing, plant clearance, pretermination agreements, standard settlement proposal forms, retention of records, accounting practices and other subjects. The issuance of these regulations facilitated the prompt settlement of terminated war contracts. During 1946, the OCS made three amendments to these regulations. Two of the changes dealt with the rules of practice and procedure for the appeal board of the OCS. The other amendment dealt with the termination cost memorandum on settlement expenses.

Reconversion of industry from war to peace was not hampered either by lack of adequate financing on terminated contracts or by failure of the government to clear contractors' plants. Partial payments, guaranteed loans and utilization of advance payments proved more than adequate to finance industry in transition. Partial payments were the most usual financing obtained by terminated war contractors. By Nov. 1946 more than \$3,000,000,000 had been paid out by the government in this type of financing. Plant clearance, both of termination inventories and of government-owned equipment, proceeded smoothly throughout the year. In only a small percentage of cases did government agencies require more than 50 days to clear plants. By Nov. 30, 1946, completed clearances were brought to \$7,000,000,000 or 95% of the total job.

The work growing out of the government's contract terminations and settlement during World War II was expected to be carried to completion in 1947. (R. L. PM.)

Controlled Materials Plan: see PRIORITIES AND ALLOCATIONS.

Co-operative Movement. The first postwar world congress of co-operatives called in Zurich, Switzerland, in Oct. 1946 provided the first opportunity for co-operatives to appraise the results of World War II and to map out world-wide policy for co-operative expansion.

The International Co-operative alliance, a permanent consultant of the United Nations Economic and Social council, reported a membership of 85,000,000 families in 37 countries and debated basic policy in regard to freedom of trade among the nations and on the relation of the co-operatives to the ever-growing power of the state. The congress reaffirmed its support of free trade and set forth a clear path of co-operation with state agencies but calling for complete independence of state domination.

The International Co-operative Trading agency, created in 1937, took steps to expand its operations and to facilitate the growing trade among the co-operatives of the world.

Most dramatic accomplishment of the co-operatives in Zurich was the creation of an International Co-operative Petroleum association. The I.C.P.A. was to push into the international field a growing branch of the consumer co-operative movement which had already become an important factor in the U.S. petroleum industry. The U.S. co-operatives, which in 1946 operated 10 oil refineries, 700 oil wells and 1,600 mi. of pipe lines, were expected to act as source of supply for the world oil co-operative. It was expected that the I.C.P.A. would eventually develop new petroleum sources and operate its own tankers and other facilities of international commerce. Already

in 1946 co-operative oil from consumer co-operatives in the U.S. had been shipped to co-operatives in Sweden, France, the Netherlands, South Africa, Australia and other countries.

In the European countries 1946 was a year of reconstruction. Many co-operatives had been destroyed during World War II. In some countries the nazis had taken over the co-operatives and used them for their own purposes. Co-operative leaders had been killed or thrown into concentration camps. Immediately at the close of the war steps were taken to reconstitute the co-operatives and to rebuild those which had been destroyed. In France, for example, 2,000 of the 10,000 shops owned by the co-operatives had been destroyed.

Tariff barriers, monetary control, controls over imports and exports and shortage of international exchange credits all hampered the normal regrowth of the co-operatives.

British co-operatives continued to grow. Membership passed the 9,000,000 mark. New hotels, department stores and other business enterprises were purchased and co-operative production facilities were converted to peacetime production after having played an important role in war production.

In Sweden aggressive programs of education, expansion of retail facilities, new housing projects and so forth went forward rapidly. Production facilities owned by consumer co-operatives included food and clothing production plants, lamp factories, pottery factories, cash register factories, paper mills, staple fibre production and 30 other types of industries.

U.S. co-operatives, once looked upon as the baby of the co-operative family, took their place in international co-operative trade and in world co-operative policy formation. Domestically three new national organizations were formed: the National Co-operative-Mutual Housing association; the Co-operative Health Federation of America and the North American Student Co-operative league. National Co-operatives, Inc., added publicity and education departments to its commodity business operations. The 30-year-old Co-operative League of the U.S.A. became an over-all federation of co-operative commodity organizations, housing, health, insurance, credit, utility, banking, recreation and other service co-operatives.

The consumer co-operatives by 1946 had become a \$1,000,000,000 business; credit union membership reached 3,500,000; rural electric co-operatives served 1,250,000 member families; 2,500,000 were members of commodity co-operatives—handling foodstuffs, petroleum products, farm supplies and other goods.

A survey at the close of the year indicated that co-operatives affiliated with National Co-operatives were operating 179 mills, factories, refineries and other production facilities. (W. J. CL.)

Coordinator of Inter-American Affairs: see INTER-AMERICAN AFFAIRS, THE INSTITUTE OF.

Copper. World production data for copper for the major countries during World War II was nearly complete at the close of 1946, and while there were still a number of minor countries missing, it was possible to form a good picture of the world industry, as the major countries listed account for 80%-90% of the total.

Of the countries listed only Mexico made an increase in output in 1945; the world total declined 15%, with the United States responsible for nearly half of the drop.

United States.—Mine production of copper declined consistently in the United States throughout 1945, from 70,114 tons in January to 58,174 tons in December, with the total for the year at 772,894 tons, a drop of 20% from the 1944 total. To maintain the supply, secondary recovery and imports were increased and exports were decreased, but even then metal was not too plentiful.

Table I.—World Production of Copper, 1939-45

(Thousands of short tons)

	1939	1940	1941	1942	1943	1944	1945

Total	728.3	878.1	958.1	1,080.1	1,090.8	972.5	772.9

During the first half of 1946 the downward trend that had prevailed throughout 1945 was aggravated by strikes in the industry, and mine output reached a low of 31,962 tons in April, but improved in the succeeding months as the strikes were settled; however, it was not until September that production came back to the January level. The October output was 64,928 tons, and the total for the 10 months was 474,307 tons, indicating a total for the year which could be little if any over 600,000 tons.

Canada.—Copper production in 1945 was 238,142 tons, a drop of 13% from 1944. The decline continued into 1946, with 137,816 tons in the first three quarters, 27% under the same period in 1945.

Chile.—Though the 1945 output of 518,191 short tons was only 5% below that of 1944, the total for the first five months of 1946 was down to 176,400 tons, or 17% below the average rate for 1945.

Mexico.—In spite of the fact that Mexico was the only country with a significant output to show an increase in 1945, production declined so sharply, beginning in December, that the output during the first four months of 1946 was 30% below the average rate of 1945, and back practically to the 1944 level. (See also MINERAL AND METAL PRODUCTION AND PRICES; STRATEGIC MINERAL SUPPLIES.) (G. A. Ro.)

Copra: see COCONUTS.

Copyright. The two most significant developments of 1946 in the field of copyright were a renewed interest in international copyright and a great increase in the number of copyright registrations. The changes wrought by World War II made obvious the desirability of entering into closer copyright relations with the rest of the world than formerly seemed necessary. A number of commercial and other treaties dealing

with copyright were considered and one, that with China, was signed. In addition, representatives of all the republics of the Americas met in Washington on June 1-22, 1946, and drew up a Pan American Copyright convention to replace the Buenos Aires convention of 1910. The new convention differs in a number of important respects from the copyright law in force in the United States. It does not require that any notice of copyright be attached to the work or that registration be made in any copyright office. It gives the citizens of each contracting state the same rights in every other contracting state which that state grants its citizens and, in addition, certain rights created by the convention itself. As applied to the United States the most important right granted by the convention is the exclusive right to control all uses and reproductions of the work. If the convention should be ratified, a

Latin-American author, particularly a composer, would have a number of rights denied to a U.S. citizen. For example, he would be able to prevent, if he could, all public playing of his music, not merely that done for profit. He would be able to collect toll from juke-box operators and to license one record company to make recordings of his music, without thereby being obliged to permit every other company to do so upon payment of two cents a record. At the close of 1946 the convention had not yet been ratified by the United States senate.

Despite the continued paper shortage the number of works registered for copyright rose in fiscal 1946 to 202,144, a 13% increase over fiscal 1945, and the largest number ever filed. Of this total only 11,802 were bound books, a number appreciably less than the 1938 prewar figure of 14,422. Music registrations, which consisted for the most part of unpublished songs, continued the upsurge which carried them after 1936 from 31,821 to 63,367. Truly the radio is a great incentive to musical composition. The number of periodicals registered also greatly increased from 39,249 in 1938 to 48,289 in 1946. (S. B. Wr.)

Corn (MAIZE). An all-time record crop of corn was harvested in the United States in 1946 exceeding 1945 by 12% and the 10-year average by 30%. The average yield also made a new high record of 37.1 bu. per acre. The total crop was estimated at 3,287,927,000 bu. for 1946 compared with 2,880,935,000 bu. in 1945 and the 10-year average of 2,608,499,000 bu. 1935-44. The part of the crop harvested for grain, 91%, compared with 89% in 1945. Favourable weather for harvest assured high quality in almost all parts of the country, frost damage being small in contrast to 1945 when there was a large proportion of "soft" corn.

The total acreage in 1946 was 91,487,000 ac., slightly above the 91,202,000 ac. harvested in 1945 and below the average of 91,698,000 ac. 1935-44. Since the acreage was below the aver-

CORN DESTINED FOR SHIPMENT OVERSEAS being shoveled from a car at a grain elevator in New Orleans, La., in 1946

age the big crop was due to the high record yield. This was attributed to favourable weather, hybrid seed and better culture. The increase in average yield in the corn belt states was startling. Iowa, the leading corn state, had an average yield of 60 bu. per acre compared with a 10-year average of 47 bu.; Illinois, 57 bu. compared with 45 bu.; Indiana 51 bu. compared with 42.2 and Ohio 48.5 bu. compared with a 44.4 bu. average. More than 80% of the seed used in the belt was of hybrid varieties, especially suited to the localities.

The large corn crop was used in feeding hogs and other meat animals to heavy weights. By Oct. 1 stocks of the 1945 crop were reduced to only 158,300,000 bu., the lowest on that date from 1937, and only about half the 10-year average of 320,000,000 bu. When the new crop was added to the stocks the total supply was above the previous record. The rate of use of corn in the fall of 1946 was at a high level.

U.S. Corn Production by States, 1946 and 1945

State	1946 bu.	1945 bu.	State	1946 bu.	1945 bu.

Oklahoma . . .	25,882,000	22,644,000			

The price of corn to producers in Jan. 1946 was at about the same level as a year earlier. Ceiling prices were fixed for corn in Jan. 1943 until the lapse of price control in June 1946. Corn was not recontrolled in August of that year. The farm price began to advance in the spring and had reached \$1.42 per bu. by June 15, 1946. In July the price rose to \$1.96 and then turned slowly downward to \$1.22 in December. The strong demand for meat-producing feeds maintained a strong market through the fall months. Never before had such record prices and such a high volume of production come at the same time. (See also VEGETABLES.) (J. C. Ms.)

Cornell University. An institution of higher learning, nonsectarian and co-educational, at Ithaca, N.Y., founded in 1865 and incorporated as a land-grant college under the Morrill act of 1862. The university comprises the endowed schools and colleges of arts and sciences, engineering, architecture, law, medicine and nursing, and the state-supported colleges of agriculture, home economics and veterinary medicine. There are also schools of education, nutrition, business and public administration and industrial and labour relations. The divisions of medicine and nursing are in New York city and are operated in conjunction with the New York hospital. Two experiment stations, at Geneva and Farmingdale, N.Y., are operated in connection with the college of agriculture. Degrees for advanced study other than professional are awarded through a graduate school.

Significant developments in 1946 included the formal opening of the school of business and public administration, the graduate school of aeronautical engineering and the department of engineering physics. A new division of modern languages, supported by a grant of \$125,000 from the General Education board, was organized. The university received as a gift from the Curtiss-Wright corporation the Cornell Aeronautical laboratory at Buffalo, which would provide excellent facilities for advanced instruction and research in aeronautics. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.) (E. E. D.)

Cornhusking. While almost all other sports events in the U.S. were being revived during 1946 on a grandiose scale, the National Cornhusking championship continued as a casualty of World War II. No successful effort was made to revive the 19th annual tournament, and Floyd Wise of Prairie Center, Ill., winner of the 1941 tournament witnessed by an estimated 115,000, remained champion. (M. P. W.)

Costa Rica. A Central American republic, located between Nicaragua and Panamá. Area, approximately 23,000 sq.mi.; pop. (official est. Dec. 31, 1944) 725,149. Of the population 80% is classified as white; about 3% are Negroes who live mainly on the Caribbean coast. The major portion of the population lives on the Meseta Central, or central plateau. The capital is San José (pop. in 1944, 77,182); other urban centres are Alajuela (10,170), Cartago (12,933), Heredia (10,578), Limón (10,033), Puntarenas (8,547). Language: Spanish. President in 1946: Teodoro Picado Michalski.

History.—During 1946 the popular-front administration of President Picado maintained its majority in congress and successfully weathered vigorous opposition from rightist groups. The congressional elections, held Feb. 10, gave 11 of the 23 seats

in question to the administration's National Republican party, 2 to its ally, the Popular Vanguard, and 10 to the coalition of opposition elements. The balloting took place peacefully, but violence beforehand and especially afterwards momentarily challenged the government's victory. A "court of honour," appointed at the insistence of the opposition, found the returns valid. In an attempt to nullify the results, both old and new deputies representing the opposition parties refused to convene with the new congress on May 1, but they eventually took their seats when a quorum materialized from the pro-administration members. Another blow to the opposition came in the loss of its leader, former president of the republic León Cortés Castro, who died of a heart attack in Santa Ana on March 3. The coalition leadership was assumed provisionally by Fernando Castro Cervantes, a wealthy land-owner.

The administration's ambitious program of social legislation was impeded throughout the year by shortages of materials, rising costs, inadequate revenues, and political disturbances. In May and June local armed risings, attributed by the government to the rightist coalition, occurred in San José and Alajuela. They were quickly suppressed.

In May 1946 the social security board requested a \$2,000,000 loan from the United States to finance government construction of low-cost housing, and the ministry of finance earmarked 70% of all available foreign exchange for essential-commodity imports, but housing and consumer-goods shortages prevailed throughout the year. In September a 6% bond issue of \$2,500,000 was launched to maintain credit facilities, pay off the floating debt, and increase the amount of money in circulation. The cost of living index (100 in 1936) had risen to 205 by October of 1946.

In foreign affairs, Costa Rica remained aloof from meetings in Salvador in January and September which looked forward to reviving the old Central American union. In November the congress recommended to the United Nations a rupture of relations with the Franco government of Spain.

Education.—There were 786 primary schools in 1944 with 76,727 students; approximately 50 intermediate schools had more than 7,000 students; and a national university enrolled more than 800. The literacy rate, approximately 85%, is the highest in Central America. In 1946 the government raised the teacher salary scale 35% and increased education appropriations for 1947 by more than 3,000,000 colones.

Finance.—The monetary unit is the colón, valued on Oct. 31, 1946, at 16.81 cents U.S. The 1945 budget (expenditures: 64,691,943 colones) was carried over through June for 1946, and expenditures provided for the last half of the year were 39,000,000 colones. On Sept. 30 money in circulation amounted to 146,700,000 colones. Gold and foreign exchange reserves on April 30 totalled \$6,054,734 (U.S.).

Trade and Communication.—Exports in 1945 rose 10.3% to \$11,611,700 while imports increased 25.1% to \$26,900,000. The United States took 87% of the exports and supplied 70% of the imports. Coffee (64.5%) was the chief export, followed by bananas (19.2%) and abacá fibre (2.4%). There were about 450 mi. of railroad and 771 mi. of improved highways in 1941. On Jan. 1, 1945, there were 2,494 passenger automobiles, 1,310 trucks, and 437 buses registered. A national merchant fleet was established in 1946 to augment the maritime service.

Agriculture.—Coffee is the main commercial crop; estimated production for the 1946-47 crop year was 10,850,000 kg. (15,979,020 kg. in 1945-46). Banana exports increased about 600,000 stems in 1945 to 2,800,000, and almost equalled that total during the first five months of 1946. Abacá fibre production for 1946 was estimated at 1,134,000 lbs., and cocoa was expected to surpass previous production (9,220,795 lbs. exported in 1944).

Hemp cultivation was increased by 15,000 ac. during the year.

Cotton. **Cotton Manufacture.**—Although cotton continued to be the dominant raw material for the world production of textiles, the threats to its leadership assumed new significance as a more normal supply-demand relationship asserted itself in the postwar period. The sharp break which occurred in the fall of 1946 in the inflated price levels of the fibre was a sharp omen.

Cotton manufacturers, in their association meetings, continued to discuss the prospects for "survival" of cotton in its fight against the synthetics, and of the United States cotton goods producing industry, in competition with countries where wages and other costs were on a lower basis.

Experiments in 100% mechanized cotton farming resulted in production of the staple at costs as low as eight cents per pound, and represented an important counteroffensive on the part of this age-old fibre.

Statistically, the position of the United States cotton industry was strong in 1946. Output was approximately 5% higher than in 1945, and continued the record high level which started with the beginning of the defense program before the United States entered World War II.

Cotton manufacturers were not disposed to peg their future on the use of cotton as their sole material, nor on the blind adherence to standard manufacturing processes.

Internationally, the prospect of a prolonged world cotton-goods famine was curtailed by the results of surveys showing that a smaller per cent of textile equipment was destroyed during the war than had been generally anticipated. (See also LINEN AND FLAX; RAYON AND OTHER SYNTHETIC FIBRES; TEXTILE INDUSTRY; WOOL.) (D. G. Wo.)

United States Production.—The 1946 cotton crop of the United States was the smallest after 1895 except for the disastrous boll-weevil year, 1921. The December estimate by the United States department of agriculture put the 1946 crop at 8,482,000 bales (500 lb. each) compared with 9,015,000 bales in 1945 and a ten-year average of 12,553,000 bales, 1935-44. This crop was about 500,000 bales less than 1945 and 4,100,000 bales less than the average. And this small crop was produced in a period when the price of cotton was at a high level, and the carry-over was large.

The acreage of cotton in 1946 was 17,639,000 ac., slightly

COTTON CROP in the United States. The figure for 1946 is the department of agriculture's estimate of Dec. 1

above the 17,059,000 ac. harvested in 1945, which was the smallest cotton area after 1885. A larger area might have been grown in 1946 had the weather not been unfavourable at planting time. The United States department of agriculture had suggested 20,000,000 ac. as the goal for 1946. For 1947 the goal was put at 23,000,000 ac. A few states had better crops than in 1945, notably Arkansas, North and South Carolina, Tennessee and California, but the decline in Mississippi and Texas brought down the total. The average yield was estimated at 229.2 lb. per acre, was 21.8 lb. below the 251 lb. yield of 1945 and far below the all-time record of 293.5 lb. in 1944. The ten-year average yield (1935-44) was 243.2 lb. per acre. Better than average yields were reported for Arkansas, California and the Carolinas, while Texas and Mississippi had smaller than average yields. The fall weather was favourable for harvesting and by Nov. 1 69% of the crop had been ginned, which was about up to the average. The output of cottonseed was at about the average ration to lint and was about 5.5% below 1945 and 34% below average, estimated at 3,455,000 tons. The crop of American-Egyptian cotton was estimated at only 2,000 bales, compared with 4,100 bales in 1945 and an average of 33,600 bales for 1935-44. This crop is grown almost entirely in Virginia, New Mexico and Texas.

The total amount of commercial fertilizers used on cotton increased to 1,479,000 tons in 1946, being applied to 8,776,000 ac. at the average rate of 337 lb. per ac. All cotton states used fertilizers with the heaviest application being in North Carolina at the rate of 530 lb. per ac.; South Carolina 510 lb.; Alabama 425 lb. and Georgia 400 lb. In Oklahoma only 120 lb. and in Arkansas 190 lb. was used.

Cotton growing promised to undergo marked changes as a result of the introduction of new machines and seed varieties. The cotton-picker was being rapidly perfected, the flame-thrower weed eradicator was tried with considerable success and other power machines were tested for the first time. Several new cotton types resulting from plant breeding experiments gave promise of yielding a fibre of greater quality, strength and spinning ability than anything raised in the past.

The price of cotton to producers which had advanced slowly through 1945 from a stable level of around 20 cents per pound since 1942, jumped in July to over 30 cents per pound and then advanced rapidly to an average of 37.69 cents in October. From this peak of prices a decline of about 10 cents followed quickly to about 29 cents through November and 29.98 cents in December. The highest price reached was the highest after 1920 and only about 5 cents below the highest point during World War I. The sudden decline in cotton created great excitement in the trade and caused the markets to close three times in two weeks. The break in the market was attributed to speculation by many small operators in the cotton belt as well as to the operations of some large scale dealers in the central markets. The price was very high in relation to competing fibres, about 18 cents above rayon, 13 cents above parity and 15 cents above the government loan level. The secretary of agriculture conducted an investigation into the causes of the decline.

This advance following the end of World War II was in contrast to the sharp drop in prices that followed the end of World War I. The principal causes of the sharp rise in 1946 was the high rate of domestic consumption, the two small crops of 1945 and 1946, the increase in exports and the general advance of all prices. The average prices to farmers through the year brought the total value of the crop above the prewar level, even with the very low production.

Foreign trade in U.S. cotton was about 50% of the world's total in 1939 and then dropped to 27% in 1940-44 increasing to 41% in 1945. In bales this change represented a decline from

6,500,000 bales exported in 1939 to a 1,376,000 bales average during the war years and a return to 3,678,000 bales in 1945 and about the same in 1946. The United States had regained about half of its foreign markets by the end of 1946.

U. S. Cotton Production by States, 1946 and 1945

(In 500-lb. bales)					
State	1946*	1945	State	1946*	1945
Texas	1,650,000	1,794,000	Missouri	305,000	180,000
Arkansas . . .	1,240,000	1,042,000	Oklahoma	260,000	285,000
Mississippi . .	1,040,000	1,560,000	Louisiana	250,000	387,000
Alabama	800,000	931,000	New Mexico . . .	145,000	106,000
South Carolina .	695,000	664,000	Arizona	143,000	117,000
Georgia	555,000	669,000	Virginia	16,000	16,000
Tennessee . . .	510,000	466,000	Florida	5,000	8,000
California . . .	435,000	353,000	All Others	13,000	9,000
North Carolina .	420,000	428,000			

*December estimate.

World Cotton Production.—Estimates of the world's cotton crop of 1946 were about 21,000,000 bales compared with 19,228,000 bales in 1945 and an average of 29,600,000 bales in 1935-39. The reduction in the United States crop was a large factor in lowering the world's total. Preliminary estimates placed the world supplies of cotton at 42,000,000 bales in Sept. 1946 which was about 5,000,000 bales below the prewar average and 2,300,000 bales less than a year earlier. World consumption was put at about 27,000,000 bales, compared with 23,200,000 bales in 1945. This would mean a reduction of about 6,000,000 bales in the carryover on Aug. 1, 1947, to almost 15,000,000 bales.

The cotton crop was reduced in India and Egypt in 1944 and 1945 to grow more food crops and increased production in 1946 only slightly. Brazil increased cotton acreage in 1945-46 and expected a crop of over 2,000,000 bales. Plantings for 1946-47 were expected to reach the wartime peak of 6,200,000 ac. grown in 1943-44. Egypt was expecting a crop of about 1,250,000 bales in 1946-47 compared with 1,100,000 bales a year earlier. India, which is usually the biggest exporter next to the United States, exported only 820,000 bales in 1945-46 which was only 37% of the 1939 volume. Production was less than consumption during the past two years which resulted in government embargoes on exports of the better grades in 1946.

Foreign countries were returning to cotton production as rapidly as the food supply became more normal due to the high price. While consumption was also increasing there was a large area of suitable land and plenty of labour in India, Egypt, China and other countries to expand the crop. The high price was expected to stimulate production in foreign countries more than in the United States, since large consuming countries such as Great Britain were likely to reduce purchases of United States cotton in favour of cheaper cotton of other countries.

The International Cotton Advisory committee continued its studies of proposals for a world cotton agreement to handle surpluses, share the world's export trade, stabilize international prices, to foster economical production and expand cotton consumption. All of the important cotton producing countries participated except the soviet union which was represented only by observers.

Council of Foreign Ministers. The Council of Foreign Ministers was created by a decision of the Big Three conference at Potsdam (July 1945), which empowered it to begin its work by preparing draft treaties of peace with Italy, Rumania, Bulgaria, Hungary and Finland and also to settle any outstanding territorial questions in Europe. France and China, invited to join in establishing the council, gave their consent. According to the

THE BIG FOUR OF 1946 are shown leaving the Foreign Ministry in Paris, July 1, 1946, after having agreed on a date for the peace conference. Left to right are soviet Foreign Minister Vyacheslav Molotov, French President and Foreign Minister Georges Bidault, U.S. Secretary of State James F. Byrnes and British Foreign Minister Ernest Bevin

Potsdam arrangements each of the five treaties was to be drafted by those governments which had signed the relevant armistice, with France, for this purpose, considered as one of the signatories to the Italian armistice. This meant that the Italian treaty would be drafted by four powers, those with Rumania, Bulgaria and Hungary by three, and the Finnish treaty by the soviet union and the United Kingdom. The council was instructed to meet in London on Sept. 1; after an initial review of the treaty problems the ministers would leave their deputies to continue the drafting of the treaties.

The Potsdam conference had also taken up a number of issues which later played an important part in the negotiation of the treaties. The soviet delegation had expressed an unmistakable interest in the future assignment of trusteeships over the Italian colonies; its claim to Italian reparation had led to a lengthy discussion of Italy's capacity to pay. Certain concessions were promised, to meet U.S. and British complaints against soviet control of Rumania, Bulgaria and Hungary, against the exclusion of correspondents from soviet-dominated areas, and against the seizure of British and U.S. property in soviet-occupied areas for reparation purposes. There was also a pointed exchange of views on the question of restoring freedom of commercial navigation on the Danube.

At the first meeting of the council, on Sept. 11—a postponement had been necessary because of the Japanese surrender—it was agreed that the French and Chinese representatives would participate in all discussions while decisions on the draft treaties would be taken on the basis of the "four-three-two" formula. Draft treaties or draft directives were presented by the delegations principally concerned, and the other Allied governments were invited to express their views in writing on the making of the treaties.

During approximately ten days the main problems relating to the Italian, Rumanian and Bulgarian treaties were reviewed. Vyacheslav Molotov proposed a soviet trusteeship for Tripolitania, while Georges Bidault urged that the former colonies of Italy be placed under Italian trusteeship. James F. Byrnes advanced a program for establishing international trusteeships under control of the trusteeship council of the United Nations, with early independence for Libya and Eritrea as the goal. After pressing British and Senussi claims briefly, Ernest Bevin rallied to the U.S. proposal, reserving his opinion concerning the period which would be required to equip these peoples for independence.

In the review of Italian territorial problems the French delegation presented a general statement of its claim to frontier modifications. This problem, together with the question of possible minor rectifications in the Italo-Austrian frontier, was referred to the deputies. Views concerning the future boundary between Yugoslavia and Italy were presented by the two governments, as well as by Australia, New Zealand and the Union of South Africa. Within the council the U.S. delegation urged that the Wilson line of 1919, corrected in Yugoslavia's favour in accordance with ethnic considerations, be taken as a basis for study, while Molotov supported the full Yugoslav claim to most of Venezia Giulia, including Trieste and Gorizia, and to part of Udine province. On Sept. 19 the council adopted a U.S. draft directive instructing the deputies, after arranging for an investigation to be made on the spot, to "report on a line which will in the main be the ethnic line leaving a minimum under alien rule."

In the consideration of the satellite treaties the soviet delegation showed great unwillingness to discuss any modification in the pre-1940 Rumanian-Hungarian frontier. The soviet and U.S. representatives fore-

saw no necessity for a change in the Bulgarian-Greek frontier, while the British and U.S. delegations wished to give a hearing to Greek claims. Molotov maintained that it would be an infringement of sovereignty to obligate Rumania, Bulgaria and Hungary to apply the principles of equality and nondiscrimination to the navigation of the Danube. The governments which had been established in Rumania and Bulgaria were defended by the soviet representative, while U.S. and British insistence on the fulfilment of the Yalta agreements implied a doubt as to whether those two Balkan regimes were qualified to represent their peoples in the making of peace. Hungary, where elections had been held in conformity with the Yalta Declaration on Liberated Europe, received U.S. recognition during the course of the London session.

Other questions not directly concerned with treaty-drafting were considered. The soviet delegation interjected complaints and allegations of the Polish government concerning repatriation of Polish troops and the transfer of property of the former Polish government-in-exile. Molotov also attacked the U.S. and British refusal to compel the transfer to soviet territory of persons who had been domiciled before the war in territory annexed in 1939-40 to the soviet union. The French delegation pressed for a discussion of the future of the Rhineland and Ruhr, but finally agreed to take up this question with each government separately. When the soviet delegation raised pointed queries about the control of Japan, the U.S. delegation, not having brought far eastern experts to London, asked to have the consideration of this question continued through diplomatic channels. After a discussion of the presence of Allied troops in Iran, in which Secretary Byrnes announced an early date for the withdrawal of the remaining U.S. troops, the British and soviet foreign ministers informed the council of an exchange of letters by which their governments agreed to withdraw all their forces by March 2, 1946.

After about ten days of discussions Molotov unexpectedly reopened the question of the council's procedure. He now maintained that the decision of Sept. 11 constituted a "violation of the Potsdam decisions" and an "attack on Allied unity" and insisted that both the discussions and the decisions on each treaty must be conducted on the "four-three-two" formula; in other words, China must withdraw from all further discussion of the five treaties and France could participate only in discussions of the Italian treaty. Since the original decision to invite France and China to join the council had been in large measure due to U.S. support, this new demand represented a rebuff to the U.S. position. However, after lengthy debate and in order to advance the drafting of the treaties, Byrnes offered to accept the new soviet interpretation, provided the council would at the same time define more fully the membership and functions of the future peace conference. Molotov continued to insist that his own proposal be adopted before he would even consider the U.S. proposal. Finally, when the soviet minister further insisted that all day-to-day records of the council made since Sept. 11, be rewritten in order to delete all references to the "illegal" participation of France and China in its meetings, the London session adjourned on Oct. 2 without agreeing on a protocol of its decisions or issuing a communiqué.

The Potsdam conference had provided for the continuance of the periodic meetings of the three foreign ministers, in addition to the meetings of the council. By Byrnes' initiative a meeting of the Big Three ministers was called at Moscow (Dec. 16-26, 1945), at which the U.S. combined proposal, rejected at London by the soviet delegation, was accepted in substance. Membership in the future conference was extended to "all members of the United Nations which actively waged war with substantial military forces against European enemy states," while the council of ministers was to operate under the soviet interpretation of the "four-three-two" formula. The reinterpreted arrangements were accepted by China, which reserved its right to participate in the drafting of the German and Japanese treaties, and by France,—by the latter after an exchange of letters between Bidault and Byrnes, in which the latter, acting for all three ministers, gave full assurances that the peace conference would be free to examine every aspect of the treaties and to make recommendations concerning them.

The deputies of the four foreign ministers now began their work at London on Jan. 18, 1946, taking as a basis the day-to-day record of

decisions of the previous September, as well as numerous proposals circulated by the participating delegations and memoranda presented by Allied and former axis states. Through their own work and that of expert committees the deputies conducted a detailed discussion of the treaty drafts. They succeeded in agreeing on a substantial number of provisions and in clarifying a wide range of issues. In particular the military, naval and air clauses were brought close to complete agreement. Since the soviet delegation was not empowered to diverge from the positions taken in September no major decisions could be reached. The deputies also appointed a commission for the investigation of the Yugoslav-Italian boundary, which, after a four weeks' study on the spot, presented to the council on April 29 a detailed report on the ethnic and economic factors involved, without, however, being able to recommend an agreed settlement.

From April 25 to May 16 the four ministers met again, in Paris. The whole range of issues was reargued, but only a few minor questions were settled. A special commission made an investigation of the Tenda-Briga area, the only important territory claimed by France from Italy, and a thoroughgoing relaxation of the Italian armistice was approved. The council agreed to leave the Rumanian-Hungarian frontier unchanged. When the soviet delegation raised numerous complaints about U.S. and British policy in Germany, Secretary Byrnes took a decisive step in U.S. policy by making public the United States offer to conclude a four-power treaty guaranteeing the disarmament and demilitarization of Germany for 25 years, later for 40 years; he also urged, without success, an immediate four-power investigation of the status of the military and industrial disarmament of Germany. The U.S. delegation met with a further rebuff in its attempt to persuade the soviet representative to agree on a date for beginning the negotiation of a settlement with Austria. The question of setting a new date for the peace conference, to replace the original date of May 1, was also hotly debated, the U.S. delegation pressing for it to be called for July 1 or 15.

After a recess the ministers resumed their labours on June 15. During the third session, which lasted until July 12, several conclusions were reached. Between June 20 and July 3 it was agreed to postpone the decision concerning the future status of the Italian colonies until the year following the coming into force of the treaty; if no decision were then reached, the matter would be referred to the general assembly of the United Nations. An impasse over the Yugoslav-Italian frontier was broken on July 3, when the "French line," which denied Gorizia, Trieste and northwestern Istria to Yugoslavia, was adopted, along with the decision to create an international "Free Territory of Trieste" under the protection of the security council. A commission appointed to work out the draft statute of Trieste in mid-August reported four divergent drafts to the peace conference.

In addition, the soviet delegation agreed on June 27 to the proposed modifications in the Franco-Italian boundary and to the transfer of the Dodecanese Islands to Greece, while on June 24 the council had adopted the soviet proposal to leave the Austro-Italian boundary unchanged. On July 4 the council assigned \$100,000,000 in Italian reparation to the soviet union; deliveries were to begin two years after the treaty came into force and the soviet union was to supply such raw materials required for reparation production as were normally imported by Italy. Numerous other questions, among them, freedom of commercial navigation on the Danube, compensation for damage to United Nations property in former axis countries, interpretation of the treaties, and others, were unresolved, but the council agreed on July 4 to convoke the conference for July 29. Several days were then spent in reaching agreement on the procedure of the conference (see PARIS PEACE CONFERENCE). With these issues disposed of, the council went on to discuss German and Austrian questions. On July 9-10 Molotov made important statements of soviet policy toward Germany, reviving the soviet demand for \$10,000,000,000 in reparation and opposing all suggestions of further territorial detachments, political decentralization or de-industrialization.

It was at first hoped that, as fast as the Paris conference (July 29-Oct. 15, 1946) presented its recommendations, the council of ministers could complete its work on the final drafts of the treaties, but this schedule could not be met. On Oct. 14 the four ministers agreed to hold a fourth session, beginning Nov. 4, at New York, where the twice-postponed general assembly of the United Nations was about to open.

As the council again reviewed the numerous unsettled issues, it was recognized that the conference's recommendations had no binding force. Indeed, one additional question was injected on Nov. 12, when Bevin urged minor revisions of the Bulgarian frontier in favour of Greece. Prospects for a settlement improved in the third week of the session, when important progress was made toward agreement on the Trieste statute. After an interview, on Nov. 25, between Molotov and Secretary Byrnes, the work of reaching final compromises was further speeded.

In this last period of work the council agreed on a statute for Trieste which set forth explicitly the responsibilities of the governor, as the representative of the Security council, for the enforcement of the statute, the protection of the citizens and the maintenance of order and security. The governor could suspend administrative acts which ran counter to his own responsibilities, and he was empowered to determine whether conditions were suitable for the withdrawal of the British, U.S. and Yugoslav troops. The council also approved a draft convention of the Free Port of Trieste which recognized the international importance of the port and guaranteed rights of free access to it by the countries of central Europe. It provided for joint Italian-Triestino-Yugoslav control of the railroads of the Free Territory.

In a final compromise on Italian reparation the council agreed on an allotment of \$5,000,000 to Albania and an increase of \$25,000,000 in the allotment to Yugoslavia. Italy's reparation obligations thus totalled \$360,000,000: \$125,000,000 to Yugoslavia, \$105,000,000 to Greece, \$100,000,000 to the soviet union, \$25,000,000 to Ethiopia and \$5,000,000 to Albania. From Italian and Bulgarian reparation combined Greece and Yugoslavia were to receive \$150,000,000 each, with Bulgaria furnishing \$25,000,000 to Yugoslavia and \$45,000,000 to Greece. The long dispute over compensation for damage to United Nations property in former axis countries was settled by providing for two-thirds' compensation, instead of the 25% favoured by the U.S. and soviet delegations or the 75%

urged by the British and French representatives.

The council also agreed on procedures for settling any disputes over the interpretation of the treaty with Italy. The conference had recommended that such disputes be referred to mixed arbitral tribunals, composed of two national members and a third member to be appointed by agreement between the disputing governments or by the president of the International Court of Justice, whereas the soviet delegation had felt that appointment of an outside umpire would be an "infringement of national sovereignty." For the Italian treaty it was agreed that ultimate recourse could be had by either party to an umpire appointed by the secretary general of the United Nations. The council also adopted the conference's recommendation that any state which failed to ratify the Italian treaty should not be allowed to claim any benefits under it; this was a safeguard against Yugoslavia's threatened refusal to accept the treaty.

Another major compromise was reached in the question of the Danube. Rumania, Bulgaria and Hungary were now obligated to observe the principle of free and nondiscriminatory international navigation, and on Dec. 12 the council issued a declaration announcing its intention of calling a conference on Danubian navigation, attended by the four powers and the riparian states, to meet six months after the coming into force of the Danubian treaties.

In concluding the first phase of its work the council set Paris and Feb. 10, 1947, as the place and date for signature of the treaties, and transmitted to the Security council the Trieste statute and Free Port convention, asking the Security council to accept the responsibilities outlined for it in the Statute. It also sent a special commission to study the financial problems of the Free Territory, and agreed to appoint a special commission to study on the spot the question of the future status of the former Italian colonies. It was agreed that the council would meet again on March 10, 1947, at Moscow, to begin negotiations on the German and Austrian settlements; meanwhile, deputies for German and Austrian questions were to begin their sessions in London on Jan. 14. (P. E. M.)

Cowles, Gardner (1861-1946), U.S. publisher, was born on Feb. 28 at Oskaloosa, Ia. After studying at the University of Pennsylvania, and Grinnell and Iowa Wesleyan colleges he went into the investment banking business. In 1903, at the behest of a friend, he bought a majority interest in the *Upper Des Moines*, a newspaper. This action launched him into the newspaper business. A few years later he purchased the *Des Moines Tribune*, and in 1924 he bought the *Des Moines News* from the Scripps-Howard syndicate. Later his sons, Gardner, Jr., and John, also entered the publishing business. Gardner, Jr., became president of the Register and Tribune Co., *Look* magazine and the Iowa Broadcasting company, and John became president of the Minneapolis Star-Journal and Tribune Co. Mr. Cowles was a member of the Iowa house of representatives for two terms (1899-1903) and was a delegate to the Republican National convention in 1916. In 1932 he was named by President Hoover as director of the Reconstruction Finance corporation. He left this post in April 1933 to return to Des Moines. He died there on Feb. 28.

Cricket. The 1946 season in England was one of the most inclement within memory. Wherever the sun offered encouragement county grounds were thronged, and in many instances membership exceeded prewar figures, but a measure of the weather can be found in the fact that on only 11 days of their long tour did the Indian team play cricket without any interference from rain. Naturally the touring team provided the chief feature of the season; though they never really consolidated into a team, their fielding was enthusiastic and agile, and in Amarnath and Mankad they had a pair of bowlers who, at their best, could compare favourably with any in England. Merchant was a great batsman and Hazare played some long and brilliant innings, while the general strength of their batting

may be gauged from the fact that early in their tour their last two batsmen each made 100 at the Oval and broke the record for the last cricket partnership. For a time in the first test match at Lord's they fairly held their own with England, but lost ultimately by 10 wickets. At Old Trafford they were rather outplayed but staved off defeat, while the Oval match, though ruined by rain, saw Merchant at his very best (129) and the best English batsmen pinned down by most accurate bowling. The general verdict was that in their own country they would have pressed England's full strength very hard.

In Hammond, Hutton, Compton and Washbrook England had some outstanding batsmen. Bedser bowled well to take 11 wickets in each of his first 2 test matches, and Wright was always a dangerous potentiality, but there was no bowler of real force in England and the two best bowlers in length and flight, Clay of Glamorgan and Goddard of Gloucester, were too old for representative cricket. The English team fielded splendidly, and Evans showed great promise as a wicket-keeper.

The Gentlemen were badly beaten by the Players. In the university match Oxford beat Cambridge.

Once again Yorkshire won the championship, their fourth consecutive success; Middlesex was second. The champions' batting was by no means secure, but their bowling was accurate and hostile and their fielding the "tightest" in the country; Sellers was a grand captain. Middlesex was the strongest batting side in the land, but their bowling lacked consistency. The western counties, Gloucester, Somerset and Glamorgan, staged a notable revival. Sides went out for a definite finish wherever possible. In late summer the Marylebone Cricket Club sent a representative eleven to meet Australia. At the end of the year Australia had won the first two test matches. (H. S. A.)

Crime. **United States.**—The year 1946 was featured by a marked rise in the number of reported crimes, each category of reportable offenses showing some increase. The totals for U.S. cities in the first six months of 1946 as compared with the same half of 1945 are shown in Table I.

Table I.—Crime in 1945 and 1946 in 1,997 U.S. Cities
(Total population 66,045,773)

Offense classification	January to June		Per cent change in 1946
	1945	1946	
Murder and non-negligent manslaughter	1,608	2,066	+28.5
Manslaughter by negligence	1,251	1,491	+19.2
Rape	3,786	3,845	+1.6
Robbery	15,236	20,085	+31.8
Aggravated assault	19,248	21,176	+10.0
Burglary	100,960	118,120	+17.0
Larceny (except auto theft)	247,745	272,126	+9.8
Auto theft	70,469	81,398	+15.5
Totals	460,303	520,307	+13.0

While a total of major offenses running well in excess of 1,000,000 annually provided no grounds for congratulation, the fact remained that the new postwar levels of crime were no more disturbing than those of the prewar period, since the nation was merely in process of returning to its more or less normal condition. Nevertheless, the especially rapid upsurge of murder and robbery provided some cause for concern lest they presage a break-through in the old peacetime ceilings for these crimes.

Table II.—Crime Rates in Rural Areas, 1945–46
(Combined population 35,164,657)

Offense classification	Crime rates January to June		Per cent change in 1946
	1945	1946	
Murder and non-negligent manslaughter	2.49	3.01	+20.9
Manslaughter by negligence	1.70	2.09	+22.9
Rape	5.07	5.49	+8.3
Robbery	6.4	9.5	+48.4
Aggravated assault	14.3	17.7	+23.8
Burglary (breaking or entering)	52.0	61.3	+17.9
Larceny (theft)	75.5	85.3	+13.0
Auto theft	26.8	36.0	+34.3
Totals	184.3	220.4	+19.6

WILLIAM HEIRENS, 17-year-old Chicago youth, signing his name in the county jail on July 5, 1946, after his arraignment on numerous charges of assault and burglary and questioning about the murder of six-year-old Suzanne Degnan. He later confessed that murder and two others, and was sentenced to three consecutive life terms

Even more pronounced were the crime increases in rural areas, with robbery, aggravated assault, auto theft and rape leading the urban rate by substantial margins.

Cities distributed among the various geographic divisions of the country showed generally comparable increases in each region. Especially marked, however, were the increases in murder and assault rates for the cities of the west north central states. Larcenies also increased most in these states and in the mountain region. By contrast there was a moderate decline in murders and aggravated assaults in the New England states, while the latter crime alone also declined in the south Atlantic area. Elsewhere in the nation the record, crime by crime, showed considerable consistency, thus emphasizing the fact that although crime rates vary widely from city to city and region to region, they respond to the same influences and rise and fall in nearly identical patterns.

Among the rapidly increasing robberies those directed against the operators of chain stores showed the greatest rise, while bank robberies declined by 52.6%. Here, however, it was to be noted that the preceding year had recorded an extraordinary percentage rise in bank robberies. As to both types of crime the number of actual offenses was so small as to provide no guide to significant trends. But when the relatively numerous commercial robberies increased by more than 90% in 1946, it justified the conclusion that here indeed was a major change in criminal *modus operandi*. Larcenies higher than \$50 increased more than twice as rapidly as those of lesser amounts, perhaps only because of marked-up values of property during the period of extreme shortage in commodities.

Average increase in value of property stolen—for all offenses involving theft—was 12.1% in 1946. Greatest increase, of course, was for robbery, which had experienced an extraordinary rise in the number of offenses.

In 64 cities having more than 100,000 inhabitants and a combined population in excess of 22,000,000 the record for property recoveries (including automobiles) fell off somewhat during 1946. In the first 6 months of 1945 such recoveries were 66.8%, but in the corresponding period of 1946 this had dropped to 62.3%. Of cars reported stolen (most of them driven away and abandoned within a few hours) 96.1% were recovered in 1946, a slight reduction from 1945. Recoveries of other types of property were much lower—at the rate of

21.1% during the first six months of 1945 and 18.3% for the first half of 1946. Such declines hold some significance because they were coincident with a 23% rise in the value of stolen property other than automobiles. Most likely explanation for the divergence is that the sudden rise in crime from its wartime low, coupled with the redeployment of police from specialized wartime duties, produced a temporarily unfavourable record. There was always the possibility, however, that police efficiency was undergoing a general decline, in which event the foregoing records, both as to cleared cases and property recoveries, would invite closer analysis.

Extent of the reporting area covered by the Uniform Crime reports reached a new high with 5,531 police agencies contributing to the nation-wide system of criminal statistics maintained by the Federal Bureau of Investigation. (See also CHILD WELFARE; FEDERAL BUREAU OF INVESTIGATION; KIDNAPPING; LAW; POLICE; SECRET SERVICE, U.S.).

BIBLIOGRAPHY.—*Uniform Crime Reports* (semi-annual bulletins) for 1945 and for the first half of 1946, Federal Bureau of Investigation, Washington. Also *Judicial Criminal Statistics* (1944) and *Prisoners* (1943), both published by the U.S. Bureau of the Census. (BR. S.)

Great Britain.—The official return of crime statistics in Britain for 1946 was to be made in April 1947. Periodical waves of notorious crime suggested an unprecedented rising of its incidence. The 1945 figure for persons dealt with by magistrates was 503,214 as against 723,578 in 1939, but the 17,569 sentenced to imprisonment by magistrates in 1939 stood against 19,710 in 1945. There were 541 penal servitude sentences in 1939 and 741 in 1945. The higher courts' sentences to imprisonment apart from penal servitude rose from 3,486 to 6,397. Youths under 21 sent to prison rose from 1,297 to 3,495 and those sent to Borstal institutions from 997 in 1939 to 1,864 in 1945.

The figures suggested considerable increase in serious crime. Indictable crime did indeed grow in London during and after World War II, though the first nine months of 1945, with its 12,000 serious and petty crimes, was thought to be the peak. In the same period of 1946 the total dropped to 11,000. Before the war the comparative level was 9,000.

An outstanding crime in 1946 was the entry of Ednam lodge, Sunningdale, at dusk one evening in October by a person who clambered up a rainpipe and entered by an open window the boudoir of the duchess of Windsor, from which jewellery valued at between £20,000 and £25,000 was stolen. The jewels were yet to be recovered at the end of the year.

Owing to the rise in the general level of wages, police forces in Britain found difficulty in 1946 in attracting the customary flow of new recruits. Special appeals were made, especially in London, where a policeman's normal beat was three times the prewar length. Special efforts were also made to encourage the public to telephone the police number in emergency, and to increase the mobility of the police through more motorization. In Nov. 1946 it was decided to re-establish the prewar special constabulary at a strength of 6,000 men.

There was little change in legislation concerning criminals. Because of pressure of other legislation, the Criminal Justice bill, a measure in which the abolition of flogging as a punishment was anticipated, was left out of the program for the 1946 parliamentary session. (See also PRISONS.) (P. BN.)

Cripps, Sir (Richard) Stafford (1889—), British statesman and lawyer, was born on April 24, the youngest son of the 1st baron of Parmoor. Educated at Winchester and University college, London, he was admitted to the bar in 1913. Sir Stafford was solicitor general in the MacDonald government in 1930 and was

elected to the house of commons as Labourite member for East Bristol. He refused to join the National Government in 1932 and sat with the opposition. For a while, Cripps was put in "coventry" by the Labourites because of his insistence in advocating a "united front" with the British Communists. In 1937, he dropped his campaign and his return to his party's good graces was reflected in his election to the party executive. In June 1940, Prime Minister Churchill named Cripps ambassador to Moscow; the appointment of the Labour leader whose long advocacy of friendship with the soviet union was a matter of record, was regarded as the first step in a new government effort to rally the Kremlin against Adolf Hitler. Cripps was successful in recementing some of the broken strands of Anglo-soviet "understanding." In Feb. 1942, he was recalled to London and made lord privy seal in the government. The following month, he was dispatched to India with the British "freedom proposals," which the Congress party leaders subsequently rejected as inadequate. In November of 1942, he was named minister for aircraft production. After the Labourite victory in the summer of 1945, Cripps was appointed president of the board of trade in the Attlee government (July 27, 1945). On Feb. 19, 1946, he was named to a three-man cabinet mission and set forth on another trip to India to discuss new measures for granting India self-government. This effort also ended in failure.

Cruisers: see NAVIES OF THE WORLD.

Crushed Stone: see STONE.

Cryolite. Imports of natural cryolite from Greenland into the United States increased from 17,562 short tons in 1944 to 20,106 tons in 1945. Exports rose from 1,064 tons in 1944 to 1,901 tons in 1945. Just to what extent artificial cryolite was produced and substituted for the natural mineral was not known, but practically a complete substitution could be made if it were necessary. One plant for making artificial cryolite was known to have been in operation in 1944 and 1945 and two other plants, completed in 1943, were not used, since supplies of the natural mineral were maintained. Adequate supplies and stocks, coupled with a heavy reduction in aluminum output permitted the removal of all restrictions on the use of cryolite in Oct. 1944. (G. A. Ro.)

Cuba. A West Indian republic, including the island of the same name, the Isle of Pines, and other minor islands and keys. The area of the main island is 44,217 sq.mi. Pop. (1943 census), 4,778,583; the density is 108.07 per sq.mi. Racial distribution is officially estimated at 75% white (of which about one-third is mulatto), 24% Negro and 1% Mongoloid (mostly Chinese). Almost 200,000 Spaniards reside in Cuba. The capital and chief port is Havana (officially, La Habana) with a pop. (1943 census) of 659,883. Other important cities (with 1943 census pop. unless otherwise indicated) are Santiago de Cuba (1946 est., 152,000), Marianao (a Havana suburb, 120,163), Camagüey (1946 est., 87,009), Matanzas (54,844), Cienfuegos (52,910), Guantánamo (42,423), Cárdenas (37,059), Holguín (35,865), Manzanillo (36,295), Ciego de Ávila (23,802), Santa Clara (27,925), Pinar del Rio (1946 est., 63,461), Regla (23,037), Güines (22,669), Guanabacoa (30,287), and Placetas (20,375). President in 1946: Dr. Ramón Grau San Martín.

History.—The year opened with President Grau's Auténtico party finally in control of the senate through the election of Miguel Suárez Fernández as senate president on Dec. 12, 1945; Juan Marinello, Communist, was elected vice-president. The

United States on Jan. 3, 1946, returned the naval air base at San Julián to Cuban control; on May 20, anniversary of Cuban independence, other wartime bases, including the \$20,000,000 military air base at San Antonio de los Baños, were turned over by the United States to Cuba. The government suppressed a small-scale revolt at Camp Columbia, near Havana, on May 17. The Auténtico party won general victories in legislative and municipal elections June 2; the mayorship of Havana, the second most important position in the island, went to Dr. Manuel Fernández Supervielle, the government coalition candidate. Communists won numerous local posts because of their election alliance with the Auténticos. Havana food workers began a brief strike Aug. 9, demanding higher wages; lower-class protests against black market conditions and prices assumed menacing proportions in Santa Clara province at the same time. Cane planters were strongly aroused in September over the government's announced intention to sequester any favourable sugar price differential which might accrue from sale of the crop to the United States. A serious hurricane on Oct. 7 caused damage estimated at several million dollars in western Cuba.

Education and Religion.—Schools numbered about 5,400 in 1946, enrolling some 520,000 pupils. Literacy was estimated at close to 70%. The government late in the year announced plans to construct 1,500 rural school buildings at a cost of 12,750,000 pesos; the funds would be taken from the government seizure of the differential on increased sugar prices.

Finance.—The monetary unit is the peso, officially pegged at par with the U.S. dollar. The preliminary estimate of the 1947 budget, regular and extraordinary, was 190,000,000 pesos, the highest in Cuban history. The original 1946 budget, then the highest, had been calculated at 163,880,000 pesos, subsequently increased to 173,400,000. The congress, however, failed to pass the 1946 budget. Regular and extraordinary revenues in 1945 were 177,126,189 pesos (1944: 162,622,834 pesos). Budgetary and extraordinary receipts in the early months of 1946 were running well ahead of those of the corresponding period of 1945. Paper money outstanding Nov. 30, 1945, was 305,708,912 pesos. The public debt Aug. 31, 1944, totalled 178,547,600 pesos. Economic difficulties helped in part to raise extrabudgetary expenditures in the first 10 months of 1946 to more than 50,000,000 pesos; the situation was the more extraordinary because of the government's need to raise its funds by decree due to the failure of congress to approve the 1946 budget. The council of ministers on Feb. 15 approved a presidential decision to buy from cane planters an extra 250,000 long tons of Cuban sugar at the U.S.-contracted price of 3.675 cents a pound and sell it at the prevailing world price of 8.5 to 9 cents a pound, covering the profit, estimated at 20,000,000 pesos, into the treasury; the profit would be used primarily for an expanded school construction program, he stated. Grau later antagonized the planters further by deciding to retain for the treasury an increased price which the United States might pay under its sugar-purchase contract. During the year the government pledged to U.N.R.R.A. a contribution of 20,000 metric tons of sugar from the 1945 crop and a similar amount from the 1946 crop in payment of a commitment of \$1,000,000 for purchase of other foods. By Feb. 1946 sugar workers' wages had increased about 29% in proportion to the higher price of sugar. Total commitments of the U.S. Export-Import bank June 30, 1946, were \$20,200,000, of which \$12,900,000 was the amount outstanding and \$7,300,000 the undisbursed balance. The official cost-of-living index at the beginning of 1946 was 182 as against 100 for the second half of 1937.

Trade and Communication.—Exports for 1945 were valued at 409,900,000 pesos (1944: 427,000,000 pesos) and imports at 238,900,000 pesos (1944: 208,600,000 pesos), leaving an active

visible trade balance for 1945 of 171,000,000 pesos, a decrease of 47,400,000 pesos. Sugar exports for 1945 included 2,456,195 long tons of raw to the United States, 502,417 tons to the United Kingdom, and 67,842 tons to Canada; 294,558 tons of refined to the United States and 54,799 tons to the U.S.S.R. Exports of tobacco to the United States in 1945 were estimated at 13,229 long tons. Exports of industrial alcohol in 1945 to the United States totalled 16,515,841 gal. Exports of bananas in 1945 (all to the United States) were 2,410,000 stems (1944: 2,058,000) valued at 1,815,000 pesos (1944: 1,629,000 pesos). Coal imports in the first four months of 1946 were 58,297 long tons; fuel oil imports in the same period were 402,499 metric tons and crude oil imports were 46,281 metric tons (fuel and crude oil imports, respectively, in the same period of 1945 were 433,944 and 20,565 tons). Imports of the chief edible fats and oils in the first four months of 1946 were 1,642,317 lb. (same period in 1945: 1,705,483 lb.); lard imports in the same period were 24,520,745 lb. (1945: 17,384,808 lb.). Raw cotton imports for the first seven months of 1946 were 6,700,000 lb. (same period in 1945: 6,100,000 lb.); of the amount in 1946, 38% came from Peru, 34% from Brazil, and 27% from the United States. Lumber imports for the first six months of 1946 were 16,400,000 bd. ft. (1945: 20,000,000 ft.), mostly U.S. yellow pine. The most important commercial agreement con-

LINE OF BUSES at Havana, Cuba, stopped for eight hours on June 27, 1946, as part of a nation-wide protest against the importation of American-built buses

cluded during the year was the contract for sale of 1946 and 1947 sugar crops to the United States. A provisional price of 3.675 cents a pound was agreed upon early in the year but definitive negotiations were not concluded until July 22, after 10 months of discussions. The terms involved the U.S. purchase of the 1946 crop (less retained quotas), estimated at 4,500,000 short tons, at the provisional price of 3.675 cents a pound; this would be subject to a proportionate increase in price if the indices of food or cost-of-living increased above predetermined levels. The United States also contracted to buy the 1947 crop (less retained quotas), estimated at 5,000,000 to 5,500,000 tons, at a price equal to the highest paid for any of the 1946 crop; details of the agreement admitted the possibility of other price increases. The United States further agreed to buy 40,000,000 gal. of industrial alcohol in the two years ending June 30, 1948, at a price of 65 cents a gal., and 115,000,000 gal. of blackstrap in 1946 and 165,000,000 gal. in 1947 at 13.6 cents a gal. The agreement further pledged the United States not to adopt any legislation which might be construed as harmful to the Cuban sugar industry. Cuba concluded agreements in March with about 10 Central and South American governments for sale of the reserved quotas of 250,000 tons of sugar at prices several cents above the U.S. base price. The government later negotiated an agreement with Mexico by which the latter country contracted to buy 100,000 metric tons of raw sugar annually for three years and to sell to Cuba 20,000 metric tons of chick-peas annually; Mexico also agreed to admit 3,000,000 Cuban cigars duty free annually.

First-line railway trackage totalled 2,959.11 mi. (2,445.49 mi. of main line and 513.62 mi. of branch lines); yard and switch trackage added 611.83 mi. Nine principal railroads had 94.5% of the public service trackage; total sugar-mill trackage was 6,907.03 mi. Aviation developments were most important in the communications field in 1946. Braniff Airways was tentatively authorized to fly a Mexico City-Havana run. A new local air line, with headquarters at Santiago, was formed. Flights from Havana to Miami, Florida, increased to 20 daily during 1946. The first half of 1946 saw 45,000 tourists going to Cuba as against 34,000 during the entire year 1945.

Agriculture.—The estimate of sugar production in 1946 was 4,476,000 short tons of raw sugar and 245,000,000 gal. of blackstrap. The estimate of rice production for 1946 was 51,000,000 lb. of milled rice, but this was only about 10% of consumption. The 1944-45 tobacco crop totalled 69,000,000 lb. of unstemmed leaf; the crop for 1945-46 increased about 30% over that figure. The estimate of 1946 henequen production was 30,000,000 lb. (1945: 29,100,000 lb.). The estimate of coffee production in the 1945-46 crop year (Oct. 1-Sept. 30) was 383,403 bags of 60 kg. (1944-45: 438,145 bags). Corn production in 1945 was estimated at 292,000,000 lb. (1944: 350,000,000 lb.); the considerable decrease was due primarily to drought and lack of adequate seed. The 1945-46 potato crop estimate was 160,000,000 lb., a gain of 30% over the preceding year. Production of beans in 1945 was 95,000,000 lb., an increase of 20% over 1944. The estimate of pineapple production for 1946 was 3,300,000 crates of 73 lb. (1945: 2,813,000 crates). It was considered that the citrus fruit industry had little chance of regaining its prewar position, although domestic markets improved somewhat in 1946. A 1945 livestock estimate of 3,884,158 head of cattle and 669,373 of hogs was thought by some authorities to be too low; a separate estimate of cattle, made the following year, was 5,334,813. A serious shortage in dairy products occurred in the 1945-46 season. Production of canned milk in 1945 was 22,000,000 lb. (1944: 31,000,000 lb.); consumption in 1945 was 25,000,000 lb. Cheese production in 1945 was 6,000,000 lb. (1944: 5,000,000 lb.). Production of com-

mercial milk in 1945 was 900,000,000 lb., a decrease of about 35% from the record 1941 production. Butter production in 1945 was about 2,000,000 lb. The government in early October announced a \$3,000,000 program of agricultural improvement, designed to improve stock breeds, introduce more machinery, better seed, refrigerating warehouses, etc.; funds for the program were intended to be derived from governmental profits on the sugar differential.

Manufacturing and Mining.—Plans were announced in Jan. 1946, for the early opening of plants to manufacture concrete re-enforced tubing, plastics, rayons and woollens. The rayon project was scheduled to begin operations in mid-1947. Cotton consumption in the marketing year ending July 31, 1946, was 35,953 bales of 500 lb. (1944-45: 31,600 bales). Cement production in 1945 was 1,059,800 bbl. of 376 lb., an increase of 37,740 bbl. The estimated volume of fruits and vegetables processed in 1946 was 50,000 short tons, of which canned pineapple accounted for 40%. Electric power consumption in 1945 was 415,000,000 kw.hr. (1944: 336,000,000 kw.hr.).

Production of various minerals in 1945 (with 1944 figures in parentheses) included: copper, 26,610 long tons (21,830 tons); refractory chromite, 178,456 long tons (170,484 tons); metallurgical chromite, 8,797 long tons (18,612 tons); manganese, 64,639 long tons (120,295 tons); manganese nodules, 130,236 long tons (133,496 tons); nickel oxide, 9,984 long tons (6,163 tons). (R. H. FN.)

Curaçao. An island off the Venezuelan coast near the mouth of Lake Maracaibo. The same name is applied to the six West Indian islands which form the Netherlands colony of Curaçao. The three islands in the Leeward group, about 40 mi. north of Venezuela, include Curaçao (210 sq.mi.; est. pop. in 1944, 78,587), Bonaire (95 sq.mi.; pop., 1945 est., 5,796) and Aruba (69 sq.mi.; pop., 1943 est., 35,933). The three small islands in the Windward group, about 500 mi. northeast, include the southern part of St. Martin (17 sq.mi.; pop., 1943 est., 2,337; the remainder of St. Martin belongs to France), St. Eustatius (7 sq.mi.; pop., 1945 est., 1,119) and Saba (5 sq.mi.; pop., 1945 est., 1,238). The only important town is the colonial capital, Willemstad (pop., 1945 est., 36,000), on Curaçao. Principal racial elements, aside from native Curaçaoans, are English, Dutch and Venezuelans; the natives are predominantly Negro, their percentages varying from 65 to 95 on the various islands. Dutch is the official language but many of the inhabitants speak a patois known as Papiamentu, composed of Spanish, Dutch, English, Portuguese, Carib and native African words. The predominant religion is the Roman Catholic. Administrative officials include the crown-appointed governor, an elective council, and, for the outlying islands, underlying officials called *gezaghebbers*. Governor in 1946: Dr. Pieter A. Kasteel.

History.—The legislature early in 1946 took steps to achieve the greater governmental maturity which Queen Wilhelmina had promised the various parts of the Netherlands colonial empire in her speech of Dec. 6, 1942. The legislature appointed a six-man commission to prepare a petition to the queen asking for autonomy, proposing "complete competence" in financial affairs, the maintenance of order, enforcement of the laws, etc. A committee, accompanied by a similar one from Surinam, left for the Netherlands June 11 to present the petition. The Netherlands government subsequently proposed a bill to modify the constitutions of the two American colonies, presumptively to involve decentralization of territorial administration for both

and a greater degree of autonomy for the component islands of Curaçao. It was anticipated that the suffrage would be broadened and that the status of the territorial governors, budgets and legislation would be modified. Netherlands officials late in the year made it known that Curaçao was to be considered as a province of a metropolitan country. A popular subscription in Curaçao during the year purchased a new home for the U.S. consulate general as a memorial to U.S. troops who had been stationed in the colony during the war; the building, it was announced, would be known as the Franklin Delano Roosevelt house. The legislature during the year considered a bill to regulate operations of foreign firms in Curaçao.

Education.—The colony's 60 schools enrolled 17,700 pupils in 1946.

Finance.—The monetary unit is the guilder or florin of 100 cents. Curaçao currency was detached from Netherlands currency in 1943; a new coinage went into circulation in that year. The colonial government announced in 1945 that Netherlands standard coins would be accepted until Jan. 17, 1946, but would not be legal tender thereafter.

Production.—The vast petroleum refining interests in Aruba and Curaçao were somewhat concerned in 1946 over the prospect that Venezuela, from which practically all oil for refining is imported, would more aggressively undertake development of its own refining industry.

Curling. After a six-year absence, the Gordon International medal was returned to the United States as a result of its victory over Canada in the annual bonspiel. The U.S. outpointed the Canadians, 398 to 273, winning 20 matches to 9 losses and 3 ties. Medals for team competition in the U.S. were well distributed. The New York Caledonians repeated as Gordon medal winners with a 21-13 victory over Utica No. 1. The No. 1 team of Brookline, Mass., won the Douglas medal with a 17-11 decision over St. Andrews of New York. Utica No. 2 scored a double, winning the Griffith and R. S. Emmet Memorial medals. (M. P. W.)

Curry, John Stewart (1897-1946), U.S. artist, was born on Nov. 14 at Dunavant, Kan. He studied at the Art Institute of Chicago, at Geneva college (Beaver Falls, Pa.) and subsequently at the Russian academy, Paris. A member of the famous "Midwestern Triumvirate," which included Thomas Hart Benton and Grant Wood, Curry brought into his oil and water colour canvasses the romance of his native farmlands. Through his pictures of rural life, circuses (he had trouped with the circus in his youth) and historical events, there was the impress of his native Kansas. The work he considered his best, though it remained unfinished and unsigned, was the murals for the state capitol at Topeka, Kan., which included the famous panel, "John Brown." He was never able to finish this monumental task because the state objected to removal of a few slabs of marble necessary for its completion. His early paintings, "Tornado," "Roadmenders' Camp" and "Tank Baptism," won professional as well as lay appreciation, and in 1934 the Metropolitan museum in New York city acquired "The Flying Codonas," "To the Train" and "Storm Over Stone City." His "Wisconsin Landscape" won a first prize at the Artists for Victory exhibition in 1942 and his war-bond drive poster, "Our Good Earth—Keep it Ours," became familiar to millions of Americans. He was elected an academician of the National academy in 1943 and was artist in residence at the University of Wisconsin from 1936 until his death. He died at Madison, Wis., on Aug. 29.

Cycling. The outstanding news in the world of cycling for 1946 was the re-establishment of the six-day bike race which had been tabled during World War II. The classic international championship was won by the team of Tino Reboli with Erwin Pesek and Rene Cyr and Mike Abt, second. It was held in the Chicago coliseum.

On the amateur side of the picture John Auerbach, chief

ENTRANTS in the first postwar six-day bicycle race in Chicago shown shortly after the starting gun on April 28, 1946

executive of the Bicycle Institute of America, announced plans for a greatly expanded program of activities to resume cycling interest.

While the running of the 43rd annual international six-day race put the cyclists back on the sports map, there was little further revival during 1946 and the records on the books as of the last active year, 1941, still stood in other events. They were the following:

National Cycling association: sprint championship, Tom Saetta of Brooklyn, N.Y.; paced title, Mike DeFilipo, Newark, N.J. American Bicycling league: senior road championship, Marvin Thompson of Chicago; junior class, Andrew Bernadsky of San Francisco; girls' championship, Miss Jean Michels of Chicago. The same A.B.L. all-American cycling group named in 1941 still stood. No new such ranking was announced for 1946. (T. J. D.)

Czechoslovakia. Czechoslovakia, a republic in central Europe, established in 1918, was dismembered in 1938-39 as the result of German aggression. Before the dismemberment the area of Czechoslovakia was 50,244 sq.mi., the pop. (1930 census) 14,729,536. In 1945 the republic of Czechoslovakia was reconstituted, but its eastern province (Carpatho-Ukraine) was ceded to the soviet union. The remaining area was 49,321 sq.mi., the pop. (1930 census) 14,001,200. Capital: Praha (pop. 848,823). Other important cities: Brno (pop. 264,925), Moravská Ostrava (pop. 125,347), Bratislava (pop. 123,852), Plzeň (pop. 114,704). President Dr. Eduard Beneš; prime minister (1946), Klement Gottwald.

History.—Elections for the National assembly were held on May 26, 1946. Of the 300 seats in the parliament 150 were assigned to Bohemia, 81 to Moravia and Silesia and 69 to Slovakia, according to the number of registered voters. In the elections the Communists emerged as the strongest single party with 2,695,915 votes and 114 seats (of which 21 were from Slovakia). The Social Democrats received 36 seats and the corresponding Slovak Labour party 3 seats. Thus the various socialist parties received 153 seats or a slight majority in the assembly. Of the nonsocialist parties the Czech National Social party received 54 seats, the Czech Catholic People's party 48, the Slovak Democrats 42 and the Slovak Freedom party 3 seats. While in Bohemia the Communists were the strongest party, in Slovakia the democratic elements carried the day.

The assembly gathered in June and unanimously re-elected Dr. Beneš president of the republic. In a close contest Antonín Zápotocký, the Communist president of the trade union federation, was elected speaker of the parliament. As the result of the leftist victory a Communist, Klement Gottwald, formed the government. The Communist party received the most important key ministries, the interior, the foreign affairs (where Jan Masaryk remained minister but with a Communist as undersecretary), information and national defense. All the economic ministries were divided between the Communists and the Social Democrats except the ministry of foreign trade which like the ministries of education and justice was held by members of the Czech National Social party, the party of President Beneš.

The nationalization law of Oct. 1945 had transformed Czechoslovakia into a highly socialistic nation. The economic conditions in the country were aggravated by the problem of labour shortage, partly caused by the expulsion of many highly skilled German workers from the Sudetenland. On Oct. 28 a two-year plan was adopted to raise the standard of living to the 1938 level and perhaps achieve a standard of living which would compare with

that in the western democratic countries. It is significant that bills presented in Nov. 1946 by the government for the regulation of the press and of the journalistic profession aroused much opposition and criticism as possible weapons of the government against democratic liberties.

The Czech government was determined to create a country which would be an exclusive national state for Czechs and Slovaks where no national minorities would be tolerated and all members of other nationalities be barred from voting and participation in the government. As the result of this policy, the whole German minority of Czechoslovakia was compelled to leave the country. The expulsion of these more than 3,000,000 former citizens was accomplished by Oct. 28. Negotiations with the Hungarian government about the exchange of the Slovak minority in Hungary for the Hungarian minority in Slovakia and about the fate of the remaining excess Hungarian minority in Slovakia went on throughout the year but the process was not completed by the end of 1946.

The People's court especially set up to try collaborators sentenced the leading Sudeten German official, Karl Hermann Frank, to death for war crimes in May 1946. Three months later Dr. Bela Tuka, formerly a university professor and prime minister in the Slovak government, was executed. Five leading members of the Bohemian-Moravian protectorate established by the Germans in 1939 were sentenced in the same month by the People's court to various terms of imprisonment. Though the People's court was instituted under decisive Communist influence and three of the four lay judges were Marxists, the Communists demanded a retrial and refused to recognize the verdict which they regarded as too lenient. The Czech democrats were, however, able to resist the demand and to maintain the independence of the courts and thus to prevent a complete departure not only from western but from established Czech concepts of justice.

Relations with the United States underwent some strain toward the end of the year. The United States had provided very substantial relief to Czechoslovakia, both through U.N.R.R.A. and through other agencies, and had granted a number of credits to ease the Czechoslovak economic situation. Some of the leftist papers in Czechoslovakia, however, followed the general anti-U.S. line of the Communist parties. The state department suspended in October the remaining \$40,000,000 of a \$50,000,000 credit to Czechoslovakia, extended in the spring for the purchase of U.S. surplus army equipment. The Export-Import bank suspended negotiations for another \$50,000,000 credit. The state department pointed out that Czechoslovakia misinterpreted the U.S. motives in extending economic assistance to European countries. A British credit for \$10,000,000 to Czechoslovakia for the purchase of surplus war supplies was, however, granted.

With the end of 1946 the relations between the United States and Czechoslovakia improved. An accord on trade policies was reached. Both countries expressed a desire to eliminate all forms of discriminatory treatment in international commerce and to reduce tariffs. The Czechoslovaks agreed that bilateral barter and clearing agreements, as entered into by the U.S.S.R. and its neighbours, were not compatible with such desires. They promised to seek a return to multilateral trading at the earliest possible date, and meanwhile to issue import licences on an equal basis among foreign supply sources dependent upon possession of sufficient foreign exchange. Both governments declared that they would negotiate as soon as possible a comprehensive treaty of friendship and commerce and would keep each other informed on the details of economic agreements with other nations.

At the end of the year Czechoslovakia had made by far the greatest progress in economic reconstruction of all the countries in the soviet sphere of influence. It also had preserved most of the democratic liberties which Masaryk's leadership had firmly established as an integral part of the Czech tradition. The Communists showed a greater

moderation than in any other country where they formed the government, and the democratic parties kept up a constant vigilance against governmental encroachment upon liberty. Full cultural contact with the democratic nations and their civilization was maintained. Thus, under very difficult circumstances, the democratic tradition survived in the country which in the period between World Wars I and II was the only one, east of the Rhine and of the Alps, which knew an unbroken democratic constitutional life. (H. Ko.)

Education.—According to a 1946 estimate, there were 14,817 elementary schools with 1,528,081 students; 261 secondary schools, 101,730 students; 1,205 vocational schools, 284,122 pupils; 15 universities, 50,631 students.

Finance.—Estimated government revenues for 1946 were \$627,720,000; expenditures \$778,480,000; gold reserves \$30,000,000; national debt \$1,952,820,000. Exchange rate (1946): 1 koruna=two cents U.S.

Trade and Communication.—From May to Dec. 1945 the value of exports totalled \$9,670,000, including: manufactures \$5,878,000; raw materials \$3,791,000; foodstuffs \$201,000. Imports totalled \$14,764,000, including: raw materials \$9,428,000; manufactures \$2,989,000; foodstuffs \$722,000.

State-operated railroads (1945) comprised 8,197 mi.; highways 43,623 mi.; navigable waterways 912 mi.

Agriculture.—Chief items of production in 1945 were as follows: potatoes 6,747,140 short tons; fodder beets 3,538,156 tons; sugar beets 3,657,479 tons; clover 3,253,365 tons; rye 1,032,728 tons; wheat 1,121,726 tons. There were 13,785,076 poultry; 3,933,024 cattle; 2,181,284 swine; 1,306,929 goats.

Minerals.—Production in 1945 included: coal 12,593,942 short tons; lignite 16,989,316 tons; iron ore 307,897 tons; gold-bearing ore 345 tons. (X.)

Dahomey: see FRENCH COLONIAL EMPIRE.

Dairy Industry, Bureau of: see AGRICULTURAL RESEARCH ADMINISTRATION.

Dairying. The dairy industry in the United States maintained the high record attained in 1945 through most of 1946 and milk production was only about 2% below the level of 1945. This was 15% above the prewar level of 1935-39. At the beginning of the year the number of milk cows on farms was estimated at 26,785,000 head compared with 27,674,000 head in 1945. The number of cows kept through 1946 was about 4% below the number of a year earlier. This decline in numbers was offset to some extent by the larger production of milk per cow which was about 4,850 lb. in 1946 compared with 4,789 lb. in 1945 and a prewar average of 4,403 lb.

The labour shortage on dairy farms was relieved somewhat in 1946 by the return of men from the military services but wages continued high. The number of milking machines on dairy farms doubled from 1942 to 1946, reducing the milking labour requirements 50% on the farms using them.

The prices of dairy products, which had been fairly stable through 1945, followed the same general trend, with slight increases until July 1946. With the lapse of price control prices advanced at once to compensate for the loss of price support payments which had been equivalent to 18% of the price of milk and 30% of the price of butterfat during the second half of 1945. The price of butterfat paid farmers advanced from 52.1 cents per pound in June to 70.8 cents in August and to 90 cents in October. Milk at the same time advanced from \$3.39 per 100 lb. in June to \$4.11 in August and \$4.73 in October.

The advance was checked however and by December butterfat was stable at 87 cents and milk at \$5.15 per cwt. The retail price of butter rose more rapidly but began to decline when consumers refused to pay the extremely high prices and butter production began to increase.

The United States department of agriculture forecast a continuation of heavy production in 1947 in its annual outlook report issued in the fall of 1946. The income of dairymen reached a new high record of \$348,000,000 in October, which was more than double the prewar income. Total milk production per capita was also about 430 lb. compared with 438 lb. in 1945 and a prewar average of 340 lb. 1935-39. (See also BUTTER; CHEESE; MILK.) (J. C. Ms.)

Dalai Lama: see TIBET.

Dalton, Hugh (1887-), British politician, was born Aug. 26 at Neath, Glamorgan county, Wales, the son of a British cleric who was at one time tutor to King George V. He was educated at Eton and Cambridge and studied at the London School of Economics (1911-13). He served with the British expeditionary forces on both the French and Italian fronts during World War I, and after the armistice, he began practicing law. Although a Tory by birth and heritage, Dalton joined the newly formed Labour party, and in 1924 he was elected to the house of commons as Labour candidate for the Peckham division. He lost his seat in commons during the 1931 elections but was returned in 1935. When Winston Churchill formed his coalition cabinet in May 1940, he appointed Dalton minister of economic warfare, and in Feb. 1942 Dalton was made president of the board of trade. After the Labour party's overwhelming victory at the polls in 1945, Prime Minister Clement R. Attlee named Dalton, July 27, chancellor of the exchequer. Politically, Dalton was a firm adherent of the party program and had expressed himself in favour of gradual socialization of Britain's economy.

In presenting his budget to commons April 9, 1946, Dalton said that while receipts were 3% lower than the 1945-46 fiscal period, expenditures were reduced by 31%. On May 2 Dalton was named to a governorship on the International Monetary fund and the Bank for Reconstruction and Development, and on Oct. 3 he was elected board chairman of both the fund and the bank.

Dams. Throughout the world construction was resumed in 1946 on dams halted during World War II because of shortages of materials and manpower. Despite continuing shortages, work was pushed on dams needed for power and irrigation projects.

In the United States, at Anderson Ranch dam, world's highest

Chief Dams Under Construction During 1946

†Highest in world.

earthfill dam, a total of 2,890,000 cu.yd. of fill was placed during the year 1946, with a record high of 422,500 cu.yd. placed during September. The diversion tunnel was closed early in 1946 providing 80,000 ac.ft. of storage during the year.

At the Davis dam on the Colorado river more than half of the 3,250,000 cu.yd. of excavation for the diversion channel was completed during 1946.

In the Missouri valley work was started during 1946 on several of the projects of the joint army engineer and reclamation bureau program for the development of the Missouri basin. Site preparation was commenced at the Garrison dam which would be the second largest dam in the world. This dam was to contain 75,000,000 cu.yd. of rolled-earth fill and was to be located on the Missouri river downstream from Fort Peck, world's largest dam, completed in 1940 and containing 122,700,000 cu.yd. of hydraulic fill.

In the Ohio river basin work was resumed during 1946 on three large dams of the U.S. army engineers. At Bluestone dam on the New river the concrete in the base of the main dam was practically complete up to high-water levels at the end of the year. Concrete pouring was under way at Center Hill dam on the Caney Fork river, and more than two-thirds of the rolled fill had been placed by the end of 1946. At Wolf Creek dam on the Cumberland river erection of a 370-ft.-high tail tower was under way to support two 2,300-ft.-long cableways for placing the 1,400,000 cu.yd. of concrete.

During 1946 construction was started on the St. Mary's river dam, largest and highest earth dam in Canada.

The largest concrete dam in the southern hemisphere was begun during 1946 in the Warragamba gorge in New South Wales, Australia, about 70 mi. from Sydney.

Construction of the Génissiat dam, on the upper Rhône river in France, continued during 1946. This dam, second largest concrete dam in Europe, was started in 1938. Work was undertaken by the Germans but was eventually stopped and finally resumed by the French in Sept. 1945. The dam was to create a reservoir 14 mi. long, making the Rhône navigable from Lyon to Geneva for 1,000-1,500-ton capacity barges and making available ultimately an additional 1,600,000,000 kw.-hr.

Repairs were completed in 1946 on the Dnieprostroi dam on the Dnieper river in the U.S.S.R. This dam, largest concrete dam in Europe, was partially destroyed by the soviet people in 1941 in an effort to thwart the advance of the German armies.

Foundation explorations were under way for a proposed dam in the Yangtze river gorge in China. The dam, 750 ft. high, would be the highest in the world. It would contain 15,000,000 cu.yd. of concrete and would be the largest masonry structure in the world. A reservoir of 50,000,000 ac.ft. capacity would be created for the irrigation of 10,000,000 ac. and the production of more than 10,000,000 kw. of hydroelectric power.

The table herewith lists 15 important dams of the world under construction during 1946. (See also AQUEDUCTS; IRRIGATION; TENNESSEE VALLEY AUTHORITY.) (B. O. M.)

Dance. In England Sadler's Wells Ballet company returned to Covent Garden in February after six years' absence, during which time the building had been used as a dance hall for troops. The house was almost immediately sold out. Later in the year Sadler's Wells launched a second company to meet demands.

There was an imposing array of new ballets and revivals: Sadler's Wells' new production of *Giselle*, a new and extended presentation of the classic *Sleeping Beauty* and *Coppelia* in its entirety. The International ballet revived *The Masque of Comus* in an extravagant performance with words, songs and luxurious scenic effects.

HUGE DAM on the Dnieper river, destroyed by the Russians before the advance of the German armies in 1941, is shown under reconstruction in 1946

Remarkable for its ingenious scenic and dramatic effects was Robert Helpmann's *Adam Zero*, a ballet of man's life on earth—birth, love, giving birth, work and death. Helpmann also did a dance version of *Hamlet*. Frederick Ashton created two new ballets, *Les Sirenes*, a burlesque of the smart set of the Riviera of 1904, and *Symphonic Variations*, a plastic interpretation of César Franck's variation for piano and orchestra. Andrée Howard also contributed two premieres: *Assembly Hall*, a light plot staged at a formal ball and having for its purpose a delightful atmospheric movement interlude interpreting the musical forms of Georges Bizet's music; *Mardi Gras* was given in November. *The Catch*, a first ballet by Alan Carter, was a charming romp with wit and freshness to its choreography. Walter Gore's new ballet *Concerto Burlesco* presented by Ballet Rambert was a satire on the musical folk to music by Béla Bartók. *The Vagabonds* by Anthony Burke was suggested by Thomas Hardy's *A Tramp Woman's Tragedy* to John Ireland's music. This is a colourful and robust ballet of love, passion, murder and resurrection set in a gypsy camp.

The Ballets Negres had a successful debut in the spring with a repertoire of four ballets: *De Prophet*, *They Came*, *Aggrey* and *Market Day*. They toured the provinces and the continent and played two seasons in London.

The Anglo-Polish ballet toured India and the east. Irina Baronova and Leonide Massine appeared in the stage version of *Ballet in the Ballet*. Ben Hecht's movie, *Spectre de la Rose*, starring Viola Essen was popular but the balletomanes were not enthusiastic. The London Royal academy celebrated its silver jubilee; and *Ballet Today*, a new periodical, appeared on the London news stands.

The New Monte Carlo Ballet company appearing in France, in England and on tour featured Serge Lifar as dancer and choreographer.

In France Les Ballet des Champ Elysées created a furor by its ballet *The Young Man and Death*, libretto by Jean Cocteau and choreography by Roland Petit.

At the Paris opera the Wednesday evening ballet was becoming more and more popular. Lycette Darsouval, prima ballerina, paid a visit to the U.S. and there was talk of exchange of dance artists. George Balanchine was engaged at the end of the year as choreographer for 1947 for the Paris Opera ballet.

In the U.S.S.R. the Kirov Theatre of Opera and Ballet at Leningrad, fully restored, celebrated the 15th anniversary of the first performance of *Swan Lake* with an extended and beautifully mounted version.

Ballet master F. V. Lopukhov continued to add athletic and acrobatic movements to the classical and celebrate the folk vocabulary of movement in his ballets. In the repertoire for 1946 *The Serf*, *Red Poppy*, *Taras Bulba* were examples of social studies in dance form; *The Flames of Paris*, *Guerrilla Days*, *Laurencia*, examples of revolutionary themes, and *Heart of the Mountains* based on Georgian folklore showed excellent use of folk movements and rhythms.

At the Moscow Bolshoi Opera theatre L. M. Lavrovsky featured the dramatic libretto in a setting of classical choreography—for instance, *Romeo and Juliet*. R. V. Zakharov's *The Fountain of Bakhchisarai* was based on Alexander Pushkin's poem and *Lost Illusions* on Honoré de Balzac's story.

The leading ballerina of the soviet continued to be the gracious and poetic Galina Ulanova of the stupendous technique. Natalie Dudinskaya and Kirillova were almost equally popular. Leaders among the male dancers were Chabukiana Sergeyev and N. A. Zubkovsky.

Ballerina Olga Lepeshinskaya toured eastern Europe and was highly acclaimed. There were rumours that the whole Leningrad State ballet would be permitted to appear outside the soviet union.

Lunacharsky State Institute of Theatrical Arts, Moscow, opened a school for dance choreographers—the first such school in ballet history. The first volume of the soviet's *History of the Arts* to be published was titled *The Ballet of the Pushkin Period*.

In Italy La Scala, historic home of the Italian ballet, was destroyed in World War II but was rebuilt in 1946 with Italian fidelity to tradition. Wanda Sciccaluga, ballerina, appeared with success in Vincenzo Tomassini's *Sartine* to music by Jacques Offenbach. *La Taglioni*, a premiere, was a nine-scene ballet choreographed by Rosa Piovella Ansaldo, music by Vittadini, décor by Nicolas Benois. Maurice Ravel's *Mother Goose Suite* ballet remained a popular feature of the repertoire.

In Poland dance continued to exist despite political troubles. The Wielki theatre, home of the ballet, was destroyed but the dance found a theatre even in the ruins of Warsaw and held forth. However, many of these artists had to earn their living by dancing in night clubs.

The Helene Kirsova Ballet company in Melbourne, Australia, with native dancers and collaborating artists choreographed *Waltzing Matilda*, drawing all the characters from the song.

In South America several new dance projects had strong patriotic motivation. *Ballet da Juventude*, sponsored by Brazil's Student Athletic federation and Student's National union, toured with success. A ballet on Brazilian folk themes was particularly popular.

In Peru the Association of Allied Artists presented an all-Peruvian ballet celebrating the country's rich folklore and featuring native dancers.

In Shanghai, China, the Shanghai Ballet Russe gave performances using some Chinese dancers but chiefly the residents of the soviet colony there. It was interesting that the Japanese invasion did not disturb the group when they took Shanghai.

In the U.S., Ballet theatre decided to break with Solomon Hurok and reorganize its company and policy. Lucia Chase, who backed the company financially from the start, became its director with Oliver Smith and an art board consisting of Lucia Chase, Henry Clifford, Aaron Copland, Agnes de Mille, Jerome Robbins, Oliver Smith and Anthony Tudor.

After an uneventful spring season in New York the company left for its first season in London. It was well received there and returned in time to open at the Broadway theatre for a fall season in New York. Igor Youskevitch, mustered out of the navy, became the company's first dancer with Hugh Laing, John Kriza, Michael Kidd and Dimitri Romanoff as the leading male dancers. The ballerinas included prima ballerina Nora Kaye and leading dancers Alicia Alonso and Muriel Bentley.

The new ballets offered by Ballet theatre were the U.S. premiere of Frederick Ashton's *Les Patineurs* to music by Giacoma Meyerbeer (a pleasant, light ballet in which the dancers pretended they were skaters) and Jerome Robbins' *Facsimile* (a modern treatment of the eternal triangle) to music by Leonard Bernstein. The ballet was danced well by Kaye, Robbins and Kriza, but was far from epoch-making.

Hurok first started to build a ballet around Anton Dolin and Alicia Markova whom he had under contract and was lending to Ballet theatre as guest artists. The advent of Col. W. de Basil into the United States, however, resulted in a new combine, and Hurok opened his regular New York season at the Metropolitan with Col. de Basil's Original Ballet Russe plus Markova and Dolin.

The spring season of Ballet Russe de Monte Carlo presented a revival of *Raymonda*, 19th-century classical ballet to Alexander Glazunov's music. *Night Shadow* with choreography by George Balanchine was set at a masked ball. The poet enjoys a flirtation with Coquette. Later his host's wife appears to him as she is sleep-walking. He falls in love with her. Coquette in pique tells the husband who stabs and kills the poet. But in the final death scene the sleepwalker appears and leads the poet away with her.

The fall season of the Ballet Russe de Monte Carlo presented Ruth Page's ballet based on Edgar Allan Poe's poem, "The Bells," to Darius Milhaud's music. The ballet, sumptuously set, did not do justice to its famous literary inspiration.

Ballet Russe de Monte Carlo personnel remained virtually the same with prima ballerina Alexandra Danilova and Frederic Franklin heading the company, Nathalie Krassovska and Leon Danielian second in rank and Ruthanna Boris, Maria Tallchief, Nicolas Magallanes as soloists. Ballerina Maria-Jeanne was the only important addition to the company.

Something really new in ballet came about before the end of the year in the formation of Ballets for America organized by Yurek Shabelevski, Yurek Lazowski and Tatiana Grantzeva.

BALLET RUSSE in a scene from Liszt's "Cercle Vicioux" at the Salle Pleyel in Paris in 1946, its first appearance there after 1939

With Nana Gollner as prima ballerina and Tatiana Grantzeva, Kathryn Lee and Bettina Rosay as first soloists plus a company of excellent dancers the company set a new precedent in doing away with the traditional corps de ballet and specializing in short ballets designed to show off the talent of the individual dancers. Two pianists took the place of the traditional orchestra.

The company had an auspicious opening in Bridgeport, Conn., on Sept. 1946 which many notables from the ballet and theatrical world attended.

Three famous pas de deux from *Don Quichotte*, from *The Nutcracker* and from *The Sleeping Beauty*, supplied the traditional part of the repertory. Starting out on tour, the company seemed slated for success because it filled a demand for a popular evening of good dancing by a small well-integrated company with minimum overhead. However, its audiences were not large enough to support its overhead and it soon folded up from lack of funds.

The dance as a whole continued to become more and more a part of life. Ballroom and folk dancing increased noticeably in popularity. National contests were revived in France and England. The United States added to the ones already established.

The Atlanta Civic ballet among other accomplishments raised \$700 at one of its performances for its civic symphony orchestra. Particularly active were Volkoff's Canadian ballet, the Winnipeg ballet, Bernice Holmes' Chicago ballet, New Jersey's Young People's Dance theatre, Lillian Cushing's Dancers of Colorado, Thelma Biracree's Rochester ballet, San Francisco Dance league, Jan Veen's Dance group of Boston, San Francisco Ballet company and Havana Sociedad Pro-Arte Musical.

The motion picture industry continued to sign up all possible celebrities in the dance, choreographers as well as dancers, but produced very little. Tilly Losch appeared in *Duel in the Sun* from the Selznick studios; Viola Essen starred in *Spectre de la Rose* produced by Ben Hecht.

The modern group was active in solo recitals and concert groups and continued its invasion of Broadway as soloists and choreographers and the conquest of the provinces by touring companies. Pearl Primus was a sensation in the revival of *Showboat*, Valerie Bettis was working on a ballet for one of the leading ballet companies. Martha Graham's new work *Serpent Heart*, a sort of modern Medea, met with success. The return of the young moderns from the armed forces enabled prewar teams and groups to get together again. Barton Mumaw gave a series of recitals at Carnegie hall; Jose Limon organized a company with Doris Humphrey as artistic director.

Both on ice and roller skates the ballet continued to flourish in arenas, theatres and hotels. The arena shows vied with each other in extravagant scenery, costumes and lighting.

Catherine Littlefield, choreographer for the ice show at Center theatre, put the classic *Nutcracker Ballet* on ice.

Two new inventions in roller skating were significant in the profession's artistic future. The first was a plastic floor which made a smooth surface free from dust or direction, that looked very deep, shiny and inviting. The other was the space skate, suspended on rubber under tension so it responded instantly and completely to the skater's intent. (L. M.H.)

Ballroom.—During 1946 ballroom dancing continued to retain the high peak of popularity that it had reached during the years of World War II. This was true despite the lack of anything new in either partnership or participation group dances. The fox trot remained the best-known dance. The rumba showed marked growth but the samba had no increase in public favour. The tango was completely dormant and there was a decrease of interest in the waltz.

Popular dancing style can be measured most quickly by the best-known dance tunes. There were no noteworthy, new waltzes during 1946, no well-known tangos and only a few popular sambas, but there were many new rumbas written in various tempos.

Some of the outstanding fox trots were played in a very slow tempo accompanied by sentimental lyrics. To such tunes as "Rumors Are Flying," "To Each His Own" and Irving Berlin's "The Girl That I Marry," dancers used very little variety in steps. Basic slow fox trot is the easiest ballroom dance; therefore, the floors were too crowded to permit intricate turns and balances by expert dancers. Instead, there was a uniformity of slow walking and side steps.

During the year the fox trot tunes that became most popular everywhere were those written in a medium, syncopated tempo. To such music dancers could use either conventional fox trot patterns or jitterbug steps. The titles of the best-known compositions were comic—for example, "Hey! Ba Ba Re Bop," "My Sugar Is So Refined" and "Shoo-Fly Pie and Apple Pan Dowdy." The livelier music attracted the better dancers. (A. Mu.)

Dartmouth College. During 1946 Dartmouth reverted entirely to a civilian student status with termination of the active-duty phase of the naval reserve officers training corps and V-12 navy programs on June 30. The summer term was attended by about 900 students and the fall semester saw all facilities in Hanover crowded to the limit with a total enrolment of about 2,850 as compared with the prewar 2,400. Dartmouth relies largely upon college dining halls to provide eating facilities which in the small village of Hanover could not be expanded beyond a total of 3,000 students—a figure which it was thought might be reached with the return of many more veterans in the Feb. (1947) semester. Other than eating, the major bottleneck was classroom facilities. Instruction for the overcapacity enrolment was being handled by the faculty through heavier teaching loads. More than 300 undergraduates were married and were provided housing in apartments constructed both by the college and the government. A unit of the Naval Reserve Officer Training Corps continued at Dartmouth on an inactive-duty basis. President John Sloan Dickey assumed the post of acting director of the new senior course in "Great Issues," which was to begin in the fall of 1947 and which would be required of all seniors. The course would be a new and major feature of Dartmouth's revised postwar curriculum and would provide instruction for all seniors in problems of the contemporary world. There would be group discussions of great issues led by visiting lecturers pre-eminent in their fields. (For statistics of endowment, enrolment, faculty, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

Deafness. Deafened people were rehabilitated in 1946 by the electroacoustical hearing aid, by lip reading and by the fenestration or window operation. Manual systems of communication for the deafened were not promoted extensively because reading of lips seemed more satisfactory.

Significant progress was made for the amelioration of hearing loss by surgery. Through clinical research otologists learned to diagnose the type of hearing defect for which the fenestration operation was most apt to give a successful result. This operation should be done by a capable otologist. It is relevant to point out that the improvement, no matter how well the operation is performed, does not re-establish normal hearing.

Most of the hard-of-hearing persons were rehabilitated by hearing aids or by lip reading or a combination of the two. The modern vacuum tube or valve hearing aid consisted of these basic parts—crystal microphone (transmitter), amplifier, two or more midget vacuum tubes, condensers, resistors, on-and-off switch, volume control, receiver and batteries. The receiver might be either of the air-conduction or bone-conduction type. For air conduction a fitted ear mould must be worn in the external auditory canal. For bone conduction the receiver must be held firmly in contact with the mastoid by means of a head band. Two batteries were required—A battery of 1½ volts and B battery of from 22½ to 45 volts. An acceptable hearing aid gave a gain of at least 30 decibels in speech reception.

The so-called "single unit" hearing aid was widely accepted. All component parts were enclosed in a single case with the exception of the receiver and its connecting wire. In 1946 hearing aids, complete with A and B batteries, weighed approximately 8–12 oz. The cost of hearing aids ranged from \$40 to \$190.

The properly fitting, comfortable ear mould was essential for satisfactory performance of an air-conduction hearing aid. A hearing loss of 30–35 decibels in the speech frequency range was regarded a handicapping loss. The hard-of-hearing person was advised to have his ears examined by a physician before considering the purchase of a hearing aid. He was also advised to have an ear mould made before attempting to make a selection of a hearing aid. A few civilian hearing-aid clinics were established in several large cities. A complete otological examination and a fitting of a hearing aid were a part of the service rendered.

A "deaf" person has defective hearing to the extent of being incapable of instruction by speech shouted loudly into the ear. A "hard-of-hearing" or "deafened" person has defective hearing in any degree short of total loss of hearing for speech.

In 1946 the number of people in the United States hard of hearing, impaired in one or both ears, was estimated to be 10,000,000–13,000,000. Of this number, possibly 4,000,000 were seriously handicapped and at least 3,000,000 required aids or the use of lip reading. Probably no more than 600,000 actually used hearing aids. The Volta Bureau for the Deaf, Washington, D.C., estimated 95,000 deaf enough to require specialized instruction in schools for the deaf.

The American Hearing society, formerly called the American Society for the Hard of Hearing, Washington, D.C., and its component societies in many cities, provided information and arranged for instruction in lip reading. In some of the component societies hearing-aid bureaus were in operation. The bureaus provided an opportunity for a deafened individual to try out hearing aids and select the one that helped him the most.

A list of acceptable hearing aids and requirements on which acceptance is based may be obtained from the Council on Physical Medicine, American Medical association, 535 N. Dearborn St., Chicago 10, Ill.

(H. A. C.)

Deaths (of prominent persons in 1946): see OBITUARIES.

Death Statistics. There was a small improvement in mortality in the United States during 1946 as compared with 1945, according to provisional reports covering the first 11 months of both years; the decrease in the death rate from the first period to the second amounted to 3%. The record for Jan. 1946 was behind that of Jan. 1945, while February of both years was at the same level; for each following month through November (the latest of record until 1947) the death rate in 1946 was lower than in 1945. There were altogether 1,401,719 deaths reported during all of 1945, the death rate being 10.6 per 1,000 population. In contrast to the somewhat more favourable mortality indicated for the United States in 1946 as against 1945, provisional reports for Canada and for England and Wales pointed to slight setbacks during 1946. Canadian reports from cities of 10,000 or more inhabitants for the first 10 months of 1946 showed a 3% increase in deaths over the corresponding period of the previous year, 1945. A total of 112,966 deaths was reported for all of Canada for the whole of 1945 and a death rate of 9.3 per 1,000 population. Reports from London and the great towns of England and Wales also showed a 4% increase in deaths for the first 11 months of 1946 as compared with the like period of 1945. For England and Wales as a whole 488,112 deaths were reported during 1945 with a death rate of 11.4 per 1,000 population.

For the entire year 1945 the death rates per 100,000 population in the United States from the more important causes according to rank were: diseases of the heart 321.5, cancer 134.5, intracranial lesions of vascular origin 97.9, total accidents 72.7 (of which automobile accidents were 21.3), nephritis 66.7,

pneumonia 44.1, tuberculosis 40.1, diabetes mellitus 26.6, syphilis 10.7, diarrhoea and enteritis 8.7, influenza 7.7, appendicitis 5.1, whooping cough 1.3 and cerebrospinal meningitis 1.3.

The ranking of the leading causes of death according to age for white persons in the United States and their death rates per 100,000 population at those ages were as follows during 1944, this being the latest year for which these data were available in 1946: ages 1 to 4 years, all causes 209, pneumonia and influenza 38, accidents (excluding motor vehicle) 36, diarrhoea and enteritis 12, congenital malformations 12, motor vehicle accidents 11; ages 5 to 14, all causes 87, accidents (excluding motor vehicle) 20, motor vehicle accidents 10, pneumonia and influenza 6, diseases of the heart 6, appendicitis 4; ages 15 to 24, all causes 174, accidents (excluding motor vehicle) 49, motor vehicle accidents 22, tuberculosis 20, diseases of the heart 12, pneumonia and influenza 7; ages 25 to 44, all causes 310; diseases of the heart 52, cancer 39, tuberculosis 38, accidents (excluding motor vehicle) 31, pneumonia and influenza 14; ages 45 to 64, all causes 1,343, diseases of the heart 452, cancer 252, intracranial lesions of vascular origin 110, nephritis 75, tuberculosis 57; ages 65 and over, all causes 6,809, diseases of the heart 2,668, cancer 858, intracranial lesions of vascular origin 833, nephritis 557, pneumonia and influenza 346.

After the end of World War II there was a sharp rise in motor vehicle fatalities. According to the experience of white industrial policyholders of the Metropolitan Life Insurance company covering the first half of 1946 and of 1945, all but the school ages 5 to 14 years showed increases from one year to the next. The rise was particularly rapid at ages 20 to 24 years, especially among females. The rise was attributed not only to an increased desire to drive after wartime gas rationing was removed, but also to the use of dilapidated cars and to the possibility that drivers may have lost some of their competence. Following its decline in the first years of World War II the death rate from motor vehicle accidents in the United States began to mount in 1944, when it resumed its first place as a cause of fatality with a rate of 18.3 per 100,000 population; it was followed in turn by fatal injury from fall 17.0, air transport accidents 5.0, drowning 4.2, burns (except conflagration) 4.0 and railway accidents (except collisions with motor vehicles) 2.6.

There were several outstanding catastrophes within the United States during 1946. Those resulting in 25 or more deaths were: Jan. 4, a tornado in east Texas, 33 deaths; March 3, a plane crash in California 27 deaths; March 19, a C-47 army transport plane crash in California 26 deaths; April 25, a railroad train collision in Illinois 46 deaths; May 10, collision of two navy planes in Florida 28 deaths; May 16, crash of a chartered plane in Virginia 27 deaths; June 5, La Salle hotel fire in Chicago 61 deaths; July 9, crash of a converted bomber in Massachusetts 25 deaths; Dec. 7, Winecoff hotel fire in Atlanta, Ga. 119 deaths; Dec. 10, disappearance of a marine corps plane 32 deaths; Dec. 12, collapse of a New York tenement 38 deaths.

Maternal mortality in the United States reached a record low of 2.1 per 1,000 live births in 1945 with only 5,668 deaths from this cause; the rate for the year before was 2.3 per 1,000 live births. Canada, in 1945, had 663 deaths from puerperal causes and a corresponding maternal mortality rate of 2.3 per 1,000 live births (to be compared with 2.7 in 1944). In England and Wales there were 1,025 puerperal deaths (exclusive of deaths from abortion) during 1945 with a rate of 1.5 per 1,000 live births (the rate in 1944 was 1.6). Maternal mortality within the United States during 1944, the latest year with complete data by areas, varied from a low of 1.7 per 1,000 live births in the Pacific states, to a high of 3.2 per 1,000 in the east south central states. Within each geographic division of the country

maternal mortality was lower in the white population than in the Negro; for the country as a whole the rate was 1.9 per 1,000 live births in the white population and 5.0 per 1,000 in the Negro population. For both races combined, the maternal mortality rate showed a decline from 4.2 per 1,000 live births at ages 10 to 14 years, to a low of 1.4 per 1,000 at ages 20 to 24 years, and thence mounted to a high of 9.0 per 1,000 at ages 45 to 49 years. Of the total puerperal deaths during 1944, 64.6% occurred during or after delivery, 14.4% were attributed to diseases or accidents of pregnancy before delivery, 15.6% to abortion and 5.4% to ectopic gestation. Septicaemia accounted for 35.7% of all puerperal deaths, puerperal toxæmia for 25.2% and haemorrhage for 18.5%. As a result of the increasing use of the sulfa drugs, the maternal mortality rate from septicaemia was decreasing more rapidly than the rate from other puerperal causes; in the brief period from 1940 to 1944 the rate for septicaemia had fallen by more than half, while the rate for toxæmia had dropped by 39% and that from other puerperal causes by 25%.

The expectation of life at birth for the general population of the United States, based upon mortality conditions in 1944, was 65.12 years for total persons, 63.55 years for white males, 68.95 years for white females, 55.30 years for Negro males and 58.99 years for Negro females. For all but white males these were the highest figures on record for the country. The poorer showing by white males is largely the result of the high mortality from accidents among those serving in the armed forces within the United States.

A notable step toward raising health standards throughout the world, and thereby lowering death rates, was taken with the signing, on July 22, 1946, of the constitution of the World Health organization, sponsored by the International Health conference, which was called by the United Nations. There participated, in addition to the 51 members of the United Nations, 10 nonmember nations. In the preamble health was defined as "a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity." Among its many functions the World Health organization undertook "to establish and maintain such administrative and technical services as may be required, including epidemiological and statistical services."

In a survey of "Some Effects of Famine On The Population of Greece" (*Milbank Memorial Fund Quarterly*, July 1946) V. G. Valaoras pointed out that the period of famine during its occupation by German forces covered the 2 years from May 1941 to April 1943, and that in this interval about 450,000 lives were lost from a lack of essential foods. The famine did not affect children and women so much as adult males, possibly because the children and women were the better protected and possibly because of conserved energy on the part of mature women in the absence of menstruation resulting from reduced food intake. The author did not find evidence of severe epidemic or nonepidemic diseases accompanying the famine. However, he did find evidence of great increases in deaths when temperature fell. (See also ACCIDENTS; CENSUS DATA, 1946; INFANT MORTALITY; SUICIDE STATISTICS.)

Debt, National. The year 1946 marked the first downward movement of the national debt of the United States after 1930. All during the years of depression and recovery the national debt had steadily mounted from

\$16,185,000,000 in 1930 to \$42,971,000,000 in 1940. This rate of expansion was tremendously increased during the years of World War II because of the huge annual total of government war expenditures. By the end of 1945 the national debt had risen to \$278,115,000,000.

The last war bond campaign to be held in connection with World War II, the Victory Loan, was conducted between Aug. 1945 and the end of that calendar year. Because government expenditures were already falling, the goal for the Victory

Source: Data from 1913 to 1946 are from U.S. treasury department, daily treasury statement (revised); 1947 estimated.

Loan was set lower than for the Seventh War Loan at \$11,000,000,000. However, the loan was heavily oversubscribed with the total sale of securities reaching \$21,100,000,000.

The result was that the treasury began the calendar year 1946 with an exceptionally large cash balance. Since the government's expenditures were drastically curtailed after the end of World War II and taxes substantially maintained, the government's deficit was reduced to a point that made the large cash balance unnecessary. During 1946, therefore, the treasury undertook a program of scaling down the public debt by using the cash balances which had resulted from the Victory Loan drive. In the course of the year the national debt was reduced from \$278,115,000,000 to \$259,149,000,000. By the end of the year there was little possibility of further reduction of the debt by this method, further debt reduction being contingent upon a surplus of treasury receipts over expenditures. It appeared from Pres. Harry S. Truman's budget message to congress that no immediate further reduction of debt was anticipated as the national debt total at the end of the fiscal year 1947 was estimated at \$260,400,000,000.

The debt reduction program in 1946 was concentrated in short-term obligations of the government, certificates of indebtedness and treasury notes. During this period the reduction in the holdings of government obligations by commercial banks approximately equalled the decline in the total public debt. The only significant increase was in the special issues held by government agencies and trust funds.

During the year there was not a great change in the holdings of U.S. savings bonds. By the end of the final war loan drive

total savings bonds outstanding had risen to \$48,183,000,000. These securities continued to increase during 1946, showing a total of \$49,545,000,000 by the end of September. The redemptions continued at about their wartime level of a little more than \$500,000,000 a month.

Experience with the "E" bonds was very similar, although by late 1946 the total outstanding was \$500,000,000 lower than the peak at the beginning of the year. It was quite apparent that the end of World War II had brought no large change in the rate of redemption, and this continued in the neighbourhood of $1\frac{1}{2}\%$ per month of the total amount outstanding.

A significant feature of the management of the public debt during World War II was the low interest rate policy that was adopted and maintained by the government. World War II was financed at an average rate of interest of 1.8% on the securities issued, compared with an average rate of 4.25% on the securities issued to finance World War I. Interest rates during the war period rose only moderately above the level prevailing during the depression of the '30s, the highest rate for long-term market issues being 2.5%. As a special inducement to individuals to increase their savings and thus assist in the government's anti-inflation program, the interest rate on savings bonds if held to maturity was fixed at 2.9%.

For total securities outstanding the computed annual rate of interest declined steadily during the war, the average rate of 2.534% in 1939 falling to 1.935% in 1945. With the liquidation of the debt in 1946 concentrated in short-term securities the average computed annual rate of interest increased. The rate in Jan. 1946 was 1.986% but by October of that year the computed rate had risen to 2.035%. This increase was primarily the result of the change in the proportionate composition of the outstanding debt.

It was evident that the stoppage of the huge debt increase, which occurred during World War II would likewise level off the annual interest payments of the federal government. In

trast to interest charges in 1940 of \$1,041,000,000.

State and Local Government Debt.—The statistics on the state and local government debt are shown in Table IV. In 1946 the downward trend of state and local debt that characterized the wartime period was continued. The total for all governmental entities was \$15,922,000,000 as compared with \$16,589,000,000 a year earlier. It may be seen that the decline in 1946 was of smaller magnitude than that of earlier years of World War II. While all categories of government units experienced some debt reduction, the decline in municipal debt accounted for the major share of the total decrease.

From 1940 to 1946 the decline in the total debt of state and local governments was slightly more than 21%. On a comparative basis the state and county governments reduced their debt more substantially than other government bodies, the percentage decline over this period being a little more than one-third. On the other hand, municipal debt, which accounted for approximately half of total state and local government debt, declined by 20%, or about the same as the total. A smaller reduction was recorded by school districts where the decline was only 10%.

Other Countries.—The changes in the national debt of the leading countries, 1935-46, are shown in Table V. It is apparent that the wartime period brought phenomenal increases in national debts throughout most of the world. Not only did the debt of all belligerent countries rise precipitously, but many of the neutral countries had to resort to borrowing to finance the unusual expenditures during this period. The only major area of the world where the debt changes were of limited magnitude during World War II was Latin America.

For all the major belligerents the outstanding debt reached unprecedented proportions. In the United Kingdom the national debt rose to £25,092,000,000 in 1946 as compared with £9,083,000,000 in 1940. While this percentage increase was less than that of the United States,

Debts, Government: see DEBT, NATIONAL.

Decorations, Medals and Badges—Military, Naval and Civil.

The United States government was embarked in 1946 on the largest medal producing program in the history of the country. Probably one of the largest procurements of any one medal design was the World War II victory medal to be issued by the war and navy departments to military and naval personnel who served honourably on active duty at any time between Dec. 7, 1941, and the date of termination of hostilities. The design was described by the U.S. war department on March 14, 1946. The design was created by Thomas Hudson Jones consisting of a medal of bronze with the figure of "Liberation" standing full length with head turned to dexter looking to the dawn of a new day, right foot resting on a war god's helmet with the hilt of a broken sword in the right hand and the broken blade in the left hand, the inscription "World War II" horizontally placed immediately below centre. The reverse has the inscriptions "freedom from fear and want" and "freedom of speech and religion" separated by a palm branch all within a circle composed of the words "United States of America—1941-1945." The ribbon was announced Oct. 25, 1945. Unlike the victory medal of World War I, this design is an exclusive design to the United States.

The U.S. war department authorized a ribbon for the army of occupation medal on April 5, 1946, for those individuals assigned, permanently attached to and present for duty with the army of occupation in Germany, Austria and/or Italy for a period of 30 consecutive days between May 9, 1945, and a terminal date to be fixed later. Credit for service in Italy was only to be given in the compartment of Venezia Giulia E Zara and the province of Udine (compartment of Veneto). In the Army of Occupation in Japan and/or Korea the 30 consecutive days' service must be between Sept. 3, 1945, and a terminal date to be fixed later. Credit would be given for service in Japan in the following islands only—main islands of Hokkaido, Honshu, Shikoku, Kyushu and surrounding small islands of Japanese homeland—Ryukyu and Bonin Islands. The medal for this service was also designed by Thomas Hudson Jones and was approved in Dec. 1946; it consists of a scene at Remagen Bridge, Germany, beneath the words "Army of Occupation." The reverse shows two Japanese junks in full sail before Fuji-yama above symbolic waves and the year "1945." On the suspension ribbon of the medal was to be a clasp marked "Germany" or "Japan" but no distinctive device was authorized for the service ribbon.

Designs for the European, African, middle eastern-Asiatic Pacific and American campaign medals had not been announced at the close of 1946. On March 15, 1946, the president designated the terminal date of service for the first medal Nov. 8, 1945, and the last two medals March 2, 1946.

The U.S. antarctic expedition medal 1939-41 authorized by congress Sept. 24, 1945, for valuable services to the nation in the field of polar exploration and science, was furnished in Dec. 1946, by the navy department to Admiral Richard E. Byrd, and the men who served on that expedition.

The design of the victory medal for World War II for the United States maritime commission service had not been announced during 1946, although authorized by congress.

The letter "V" device was authorized in 1946 by the U.S. war department for the suspension ribbon and service ribbon of the Bronze Star medal only to distinguish the award for valour rather than meritorious service.

Regulations governing the civilian award of the medal for merit were announced by the medal for merit board and ap-

it must be recognized that Great Britain had a much higher debt than the United States at the beginning of World War II in comparison to the economic potential of the country. By the beginning of the war the debt of Germany and Japan was already high, because of the war preparations of the preceding years. Nonetheless, the increase during the war was many times greater. The Japanese debt was 219,075,000,000 yen in 1946, almost 10 times as large as the total in 1940, while the German debt rose from RM 47,950,000,000 in 1940 to RM 383,100,000,000 in 1945. The increase in the Italian debt during the war was more than fivefold.

The debt statistics of the occupied countries, made available after the end of World War II, gave some indication of the heavy cost of German occupation. The Belgian debt in 1946 totalled 278,868,000,000 francs as compared with 71,333,000,000 in 1940. Over the same period the French debt increased from 708,679,000,000 francs to 1,999,441,000,000. Bulgaria, Czechoslovakia, Finland, the Netherlands, Norway and Rumania had similar experiences. (See also BUDGET, NATIONAL; GREAT BRITAIN.) (M. G. T.)

TRUMAN PRESIDENTIAL MEDAL issued by the U.S. mint in June 1946. Stamped on mint bronze, the medal is three inches in diameter

proved by the president Nov. 7, 1945.

A president's certificate of merit was authorized June 6, 1946, to be awarded by the president or at his direction to any civilian who on or after Dec. 7, 1941, performed a meritorious act or service which aided the United States or any nation engaged with the United States in the prosecution of World War II and for which there is no other suitable award or recognition.

A new design of lapel button for war department meritorious civilian service award was approved during 1946.

During the year the relative sequence of wearing the Silver Star and the Legion of Merit were reversed, so that the Silver Star is now prescribed to be worn before the Legion of Merit.

(A. E. DU.)

Defense Communications Board: *see* FEDERAL COMMUNICATIONS COMMISSION.

Defense Transportation, Office of. The Office of Defense Transportation entered the year 1946 with its controls over the United States transportation operations largely limited to waterway and rail transportation services.

On Jan. 8 the ODT relinquished possession and control of the Capital Transit company of Washington, D.C., the operation of the lines—taken over in Nov. 1945 following a labour dispute—being the last holdover activity of the former ODT highway transport department.

As soon as rail passenger traffic showed signs of easing, the ODT moved to modify or revoke its wartime passenger traffic regulations. The completion and delivery of 800 new troop sleepers and reductions in the movement of troops from west coast ports of arrival made possible the revocation, late in January, of the orders which set minimum speeds for the operation of troop trains and allocated aeroplane space from the west coast to returning troops.

As of Feb. 15, the 450-mi. limitation on sleeping car runs was eased by reducing the mileage limitation to 350 mi. A further reduction to 250 mi. was made, effective March 1. The order was revoked March 15. The time limit on Pullman reservations was also revoked as of March 15.

On Feb. 6 the ODT assumed possession and control of 91 towboat companies operating in New York harbour and contiguous waters because of a strike of 3,500 tugboat workers. Following the signing of an arbitration agreement the properties were returned to private control March 3.

To expedite the movement of grain and foodstuffs for export relief, the ODT late in February and in March requested the Interstate Commerce commission to issue service orders requiring carriers to give preference in furnishing cars to certified shippers of food for export relief and to give priority to country grain elevators on orders for empty cars, and appointing an agent to pool empty boxcars for the transportation of foodstuffs

for overseas relief. These orders were suspended or revoked later in the spring as the movement of export foodstuffs improved.

On May 1 the ODT revoked its two remaining orders regulating railroad passenger traffic, general orders ODT 55, which had placed all railroad passenger day coaches, baggage and express cars at the disposal of the military authorities under ODT supervision, and ODT 56, which had established uniform occupancy standards for railroad cars in organized military movements.

In order to conserve railroad coal supplies during the 59-day bituminous coal strike, the ODT, early in May, reduced coal-burning passenger locomotive service by 25% as of May 10 and by 50% as of May 15. At the same time the ODT issued a directive to the Association of American Railroads embargoing all rail freight with the exception of commodities and supplies necessary to public health and safety, such as food, fuel, animal feed, medical supplies and printing paper and ink. Railway express shipments were later embargoed. Motor carriers were also ordered to give preference to the movement of essential commodities.

In anticipation of a strike of railroad employees the ODT was ordered by the president to assume possession and control of the nation's 337 rail carriers on May 17. Following the stoppage of rail service the ODT on May 23 issued a series of orders co-ordinating the use of air, highway and water transportation services. Preference lists of essential commodities were established for each type of carrier, joint action and equipment and service pooling arrangements were authorized and ODT officials were named to administer the emergency transportation measures. A complete and integrated organization was directing transportation of essential needs when the strike was called off on May 24. The emergency measures were rescinded shortly thereafter, possession and control of the railroads being relinquished as of 4 P.M., May 26. At the same time the ODT relinquished possession and control of the Illinois Central railroad which had been under government control as a result of a labour dispute from Aug. 23, 1945.

The ODT assumed possession and control of the Monongahela Connecting Railroad Co., on June 14, following a labour dispute. The line was returned to private operation Aug. 12 upon settlement of the differences.

Although the ODT was scheduled to liquidate its activities at the close of the fiscal year, June 30, shortages of railroad freight equipment, continued increases in freight traffic and ODT operation of several transportation services involved in labour disputes resulted in congressional authorization for continuance of the agency until April 30, 1947.

Freight car loadings, particularly boxcars and coal cars, continued to rise during June and by mid-July loadings were above their wartime peaks. To meet the demand for boxcars in the grain-growing regions, the Interstate Commerce commission at the request of the ODT ordered the movement of 1,000 empty boxcars per day into the central, western and southwestern regions.

To reduce the detention of coal cars penalty demurrage charges were imposed as of Aug. 1 in an ICC service order issued at ODT request. Coal receivers were also asked to provide for Saturday unloading and loading within the allotted free time. In an effort to increase heavier loading of freight cars, the ODT revised and reissued its less-than-carload and carload freight orders, general orders ODT 1 revised, and 18A revised, effective Aug. 11. Through arrangements made with the Interstate Commerce commission service agents of the ICC bureau of service were assigned the task of isolating and reporting non-compliance with ODT orders and of obtaining efficient and maximum utilization of railroad facilities.

Additional appeals were made to shippers and receivers of freight to speed up the loading and unloading of freight cars and the railroads were called upon to reduce the number of bad order cars and increase their orders for new equipment. The appeals resulted in a steady improvement in turn-around time and continued reductions in the number of bad order cars during the late summer and fall months. Turn-around time decreased from 14.4 days in June to 13.0 days in October. Bad order cars declined from 82,000 in July to 73,000 in November.

As predicted by Col. Johnson early in the spring, freight car loadings during October and November reached record highs, surpassing the highest loadings from 1930. For the five weeks prior to Nov. 16 loadings were running at an average of 925,000 a week, a figure considerably above wartime levels.

Several days before the year's second stoppage of bituminous mining operations the ODT ordered a 25% reduction in railroad passenger service performed by coal-burning locomotives, effective 11:59 P.M. Nov. 24. On Dec. 3 after the strike had been in effect for about two weeks, the ODT took further restrictive measures to conserve the nation's remaining stockpiles of railroad bituminous coal, and, in addition, made plans to reinstate the emergency organization setup to direct transportation of essential needs at the time of the railroad strike in May.

On Dec. 7, following the announcement that soft coal mining operations would be resumed ODT acted immediately Dec. 9 to restore normal rail passenger, domestic and export freight, express and parcel post services. (*See also* ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION; RAILROADS.) (J. M. J.)

De Gaulle, Charles: *see* GAULLE, CHARLES DE.

Delaware. Delaware, on the middle Atlantic seaboard, is one of the original 13 states, known as the "First state," having been the first to ratify the federal constitution, Dec. 7, 1787. A much-used popular name is the "Diamond state." Area 2,057 sq.mi. (land 1,978; inland water 79). Popu-

lation (1940) state-wide 266,505, of which 139,432 were urban, 127,073 rural. Native white numbered 215,695; foreign-born 14,913; Negro 35,876. Wilmington, 112,504, is the one city of more than 6,000; Dover, 5,517 is the capital. The bureau of the census 1945 estimate for the state was 286,832.

History.—With almost complete demobilization by the end of 1946, 27,589 veterans of World War II were home in the state, 2,602 of whom were attending schools and colleges; 2,216 were unemployed at the end of the year. Cost of living increases in Wilmington, June to September, were: food 18.05%, clothing 7.3%, house furnishings 4.2%.

The Delaware state guard was disbanded and the Delaware national guard reorganized, with an air unit. The Delaware battalion of the United States naval reserve was established and a 180-ft. patrol craft, the PC 609, assigned to it. The Veterans' administration established a hospital at the New Castle county army air base, pending construction of a \$6,000,000, 320-bed hospital near Wilmington. Fort du Pont army air base (site and buildings) was given to the state for use as a welfare and recreation centre. Pres. Harry S. Truman signed the bill authorizing construction of the \$25,000,000 Delaware river bridge between Delaware and New Jersey.

At the general election in November, Republicans were elected to congressional and state offices. The total number of voters was highest for the office of United States senator, 113,533 out of a total of 169,703 qualified voters. Elected were: U.S. senator, John J. Williams; U.S. representative, J. Caleb Boggs; attorney-general, Albert W. James; state treasurer, Benjamin F. Johnson; state auditor, Benjamin I. Shaw; insurance commissioner, William J. Swain. Gov. Walter W. Bacon, Secy. of State William J. Storey and State Tax Commissioner Pierre S. du Pont continued in their offices. The state legislature of 52 members was composed of 35 Republicans and 17 Democrats. The first woman was elected to the state senate. One woman was elected to the house, the third after 1920.

Education.—Following the resignation of Dr. H. V. Holloway, Dr. George R. Miller, Jr., became state superintendent of schools. During the year a commission, authorized by the 1945 legislature to study the public education system and provided with an appropriation of \$25,000 for the purpose, completed its report containing the findings of competent educational specialists. Citizen participation in the problems of education was indicated by the organization of the state-wide Council for Delaware Education. The teacher shortage was acute. The state board of vocational education reported that 1947 disabled persons were earning \$1,670,356 in 1946 as the result of the board's rehabilitation service.

The 165 elementary schools had an enrolment of 25,615 pupils and a teaching staff of 934; in the 46 secondary schools, 16,635 were enrolled with a teaching staff of 726.

Social Insurance and Assistance, Public Welfare and Related Programs.—The amount of social insurance paid out for the year 1946 was \$1,746,663. Active claims on Dec. 31, 4,244. The cost of outside relief for the 5,669 cases during the year was \$175,519.42. By law this cost was shared half and half by the state and the county in which the relief was given. In June 1946, 1,187 persons were receiving old age pensions compared with 1,297 the previous June. The children's aid program cared for 850 children in their own or foster homes, state appropriation \$243,300; appropriation to Ferris school (correctional for boys) \$129,000; to Kruse school (correctional for Negro girls) \$50,400. Expenses of penal institutions (no state prison), a small jail in each of the two rural counties, and a workhouse in New Castle county, were paid by the counties. New Castle county workhouse received during the fiscal year June 30, 1945, to June 30, 1946, 1,522 prisoners and discharged 1,500; inmates on the latter date, 265.

Communications.—Mileage of highways and rural roads, all controlled by the state highway department, was 3,897.14; income for the fiscal year ending June 30, 1946, \$3,906,069.66, expenditures, \$3,819,808.56; cash balance for the 2-yr. period, \$1,700,200.56. Federal aid was \$272,183.97 compared with \$155,203.56 for 1945. Traffic increase to prewar levels brought a 29% increase in motor accidents over 1945, but a decrease of 5% from 1941. Railroad mileage was approximately 279.

Business for the calendar year at the port of Wilmington nearly doubled that of 1945. Tonnage was 419,245 compared with 217,705 in 1945. Tonnage through the Delaware and Chesapeake canal (11,730 vessels) was 3,653,258 compared with 3,645,915 (11,321 vessels) the previous year.

Chartered service was available at several of the state's 10 airfields and applications were received from 11 major air lines to operate scheduled services from the New Castle county air base (when returned to the county by the army). On Dec. 31, 1946, the state had in use 81,657 telephones.

Banking and Finance.—There were 28 state banks, mutual savings banks and trust companies with 6 branch banks and 9 branch offices, 13 national banks, 39 building and loan associations and 19 small loan companies. Total assets of banks and trust companies June 30, 1946, were \$567,963,881.80 compared with \$532,358,319.67 in 1945; deposits in all banks were \$507,740,263.89, an increase of 6.6% for the fiscal year, the smallest in 4 years. The 39 building and loan associations had assets of \$17,082,094.91, an increase of 6.66% during the year.

Total state revenue for the fiscal year ending June 30, 1946, was \$22,592,398.76; non-revenue income \$1,356,706.08; total \$23,949,104.84. Expenditures were \$20,523,569.62; balance \$3,425,535.22, added to balance at beginning of period of \$13,947,766.08 made a cash surplus for the fiscal year of \$17,373,203.30. The gross debt (serial bonds for permanent improvements) was \$4,250,000; total debt service \$809,853.75.

Agriculture.—The estimated total cash income from agricultural production for the year, \$90,000,000, was the best in 25 yrs. Income from the broiler industry was an exception. It declined 20% from \$65,174,000 in 1945 but was still the most important source of agricultural income. The total cash income (from livestock and crops only) from January to September was \$62,272,000. Of this livestock amounted to \$50,070,000; crops \$12,202,000. The Delaware peach crop for the year was 454,000 bu.

Table I.—Leading Agricultural Products of Delaware, 1946 and 1945

Crop	1946	1945
Corn, bu.	4,270,000	4,224,000
Apples, bu.	825,000	308,000
Hay, tons	99,000	109,000
Wheat, bu.	1,216,000	1,306,000
Tomatoes, tons	42,000	30,000
Strawberries, crates	66,000	44,000
Lima beans, tons shelled	8,160	9,880

Manufacturing.—Total estimated value of manufactures for comparison with the total of \$220,257,162 as of the year ending Oct. 31, 1945, was not available for 1946. The total of employees under the unemployment compensation law for the month of Sept. 1946 was 86,000; total wages for the year, \$204,000,000, compared with 66,000 in Dec. 1940 and wages of \$112,000,000 for that year. In Nov. (1946) 621 plants in the Wilmington area reported an employment total of 59,270 compared with 52,363 for Nov. 1945. Turnover for the month ending Nov. 1946 was 1,385 employed, 1,140 laid off.

Table II.—Principal Industries of Delaware 1946 and 1945

Industry	1946	1945
Chemicals	\$29,663,917	\$43,203,298
Shipbuilding	18,384,584	63,294,890
Leather	27,637,666	11,501,630
Foundries, machine shops, tools	22,603,062	33,603,377
Fibre	11,802,556	24,407,180
Textiles	43,959,969	35,603,254
Canning and packing	10,703,548	872,732

Mineral Production.—The chief products, building stone, granite, sand, brick and clay, for the year ending Nov. 1, 1946, had a total value of \$363,159 compared with \$203,705 for the previous year.

Democracy: Democracy is not only a technique of government, based upon freely elected representative institutions, and upon an executive responsible to the people; it presupposes also the belief in the dignity of every individual and his inherent rights to freedom of thought and expression. It rejects all totalitarian forms of government and recognizes spheres of individual freedom, protected by law against government interference. Democracy demands a spirit of tolerance and compromise which emerges in the interplay of several parties, in the free discussion of various viewpoints.

Though in 1946 European countries suffered to an unprecedented degree from economic chaos and misery, elections, wherever they were held with assurance for various parties to present their conflicting points of view in freedom, resulted in a victory of democracy over totalitarian tendencies. In free elections communists polled the highest percentage in Czechoslovakia (38.6%) followed by France where they received 28.2% in the elections of Nov. 10 and 26.2% in the elections of June 2. They showed a lesser strength in Finland (23%), Italy (18.9%) and Hungary (17%). They represented only small minorities in the other countries, 12.46% in Denmark, 11.3% in Sweden, 10.4% in Belgium, 10% in both Luxembourg and the Netherlands, 9.3% in Greece, 8% in Norway, 5.5% in Austria and 0.3% in Great Britain.

In Britain, the Labour party retained its hold on the electorate. It did not lose any seats in parliamentary by-elections, and the municipal elections of Nov. 1 brought it a large gain.

Nine more boroughs in England and Wales came under labour control. The communists were completely routed. Of their 223 candidates only 1 was elected, in Willesden in northwest London, while 6 communists lost the seats they had held on various local councils.

In France and in Italy moderate socialist and Catholic democratic parties showed great strength but toward the end of the year the extreme parties both on the left and on the right gained in votes and in influence and made the formation of governments more difficult. Elections in the Netherlands and Belgium showed the strength of the conservative democratic parties in both countries. In the Scandinavian countries the social democrat parties formed the government.

In Japan, a country where democratic traditions have never existed, democracy under U.S. guidance made remarkable progress against totalitarian tendencies. On Nov. 3 Emperor Hirohito officially promulgated the new organic law which proclaimed the sovereignty of the people and renounced forever the maintenance of armed force in Japan. The formerly all-powerful throne was reduced to the status of a national symbol. In his proclamation the emperor stated: "This constitution seeks the basis of national reconstruction in the universal principles of mankind. It has been decided upon by the freely expressed will of the people. It explicitly stipulates that the people of Japan renounce war of their own accord; that . . . having constant regard for fundamental human rights, they would conduct their national affairs on the fixed line of democracy. It is my wish to join with my people in directing all our endeavours toward the building of a nation of culture tempered by sense of moderation and responsibility and dedicated to freedom and peace."

Even in Germany the trend from dictatorship and totalitarianism to democracy was apparent. The most convincing test came in the municipal elections of Berlin on Oct. 20 when the soviet-sponsored Socialist Unity party, which included the Communist party, was thoroughly defeated by the Social Democrats who were forbidden in the soviet zone. In the new municipal council the Social Democrats held 63 seats, the Christian Democratic union 29, the Socialist Unity party 26 and the Liberal Democrats 12. Even in the Russian zone in Berlin the Social Democrats received many more votes than the Socialist Unity parties. Taking all the elections throughout Germany into consideration, the results by the end of the year gave to the Christian Democratic Union 34.5%, to the Social Democratic party 23.8%, to the Socialist Unity party 16.8%, to the Liberal Democrats 12.5% and to the Communist party 4.8%. In interpreting these figures it must be taken into account that the Social Democrat party was forbidden in the Russian zone, that there existed only the Socialist Unity party under communist leadership but with a large Socialist membership, and that the Communist party itself existed only in the U.S., British and French zones.

The Chinese national assembly which met in Nanking in Dec. 1946 agreed upon a schedule to put the new Chinese constitution into effect. According to this schedule the constitution would become law in 1947, with the election of the first president under it fixed for Oct. 10, the anniversary of the proclamation of the republic by Sun Yat-sen. A nation-wide election was to be held six months after the new election laws became effective. The constitution's bill of rights would be put into effect in 1947. It was hoped these provisions would help to accelerate the transformation of Generalissimo Chiang Kai-shek's national government into a Democratic nontotalitarian regime.

The new Democratic Chinese constitution, adopted largely by the efforts of Chiang Kai-shek on Dec. 25 by the 1,486 delegates of the Chinese national assembly, was framed by most

Chinese parties but without the communists. It represents a combination of the United States presidential and the British parliamentary forms of government with certain Chinese traditional institutions. It contains a modern bill of rights and provides for a president eligible for two six-year terms and a national assembly, the supreme legislative body, which can recall the president and all officials and amend the constitution. In addition the government preserves the traditional five branches or Yuans of China. (See also COMMUNISM; EDUCATION; FASCISM; GREAT BRITAIN; UNION OF SOVIET SOCIALIST REPUBLICS; UNITED STATES.)

Democratic Party. As 1946 closed, the Democrats were waging a desperate, defensive struggle to retain the political supremacy which they had enjoyed for so many years under the leadership of Franklin D. Roosevelt. Although they had lost control of congress in the Nov. 5 election, and had been outmanoeuvred and outvoted through most of the year, President Harry S. Truman was changing administration policies and realigning his forces for future battles, especially the 1948 presidential contest.

Truman, whose prestige had fallen so low that he took no active part in the November campaign, assumed full command of the party. He made almost a clean sweep of his economic cabinet after election day, ousting numerous New Dealish officeholders. He also scrapped the controls and forms of regimentation which they had written and enforced. He apparently felt that their program had been partially responsible for his defeat.

In effect, he reinstalled the system of private enterprise. He lifted ceilings on all foods save sugar, rice and syrups. He abolished the elaborate veterans' housing program which he had sponsored only 12 months earlier, returning the construction industry to private and unfettered builders. He lifted almost all federal reserve restrictions on the use of credit.

Truman boldly attacked another problem which had contributed to the administration's setback—labour strife. When John L. Lewis, president of the United Mine Workers, promoted a soft coal walkout in late November, the president fought him to a finish.

The mine chieftain, who had won most of his battles with Roosevelt, was brought into federal court, where a fine of \$3,500,000 was levied against his union and \$10,000 against him. Federal Justice T. Alan Goldsborough of the District of Columbia said that he would have sent Lewis to jail if the government had asked for such a stiff sentence.

Even more than his abandonment of wartime controls, which many New Dealers wanted to retain, the showdown with organized labour (both the A.F. of L. and the C.I.O. backed Lewis) reflected Truman's determination to rehabilitate the fortunes of the party and himself, if possible. It likewise revealed his recognition of the fact that both stood in need of repair.

Nor were Truman's recuperative activities devoted only to these domestic problems. Recognizing that the administration's earlier pro-Russian attitude had made enemies, he dropped the so-called "appeasement of Stalin." At United Nations sessions Secretary James F. Byrnes "talked tough" to Russian Foreign Minister Vyacheslav M. Molotov, and wrung some concessions from him.

The administration also announced that it would deny food relief to Moscow satellites which "bit the hand that fed them." or which spent money on new armaments instead of bread. At

home Truman named a special committee to rid the government of employees who could not pass a loyalty test.

In these and other ways the president responded to new needs and demands as voiced by the electorate in the November voting. Regardless of his motives, rarely has a president bowed so quickly and so completely to a ballot-box mandate. His reorientation cheered Democratic conservatives, but it disappointed "liberals" and "radicals."

His prestige soon leaped upward from its November low, when Senator J. William Fulbright, Arkansas Democrat, had urged that he resign, name a Republican as secretary of state and hand the government over to the G.O.P. Even Alfred Landon, the Republicans' 1936 presidential nominee, after visiting Truman in mid-December, conceded that "the president's stock has gone up a little."

The Democrats' difficulties and defeats in 1946, however, were not due entirely to Truman's mistakes or shortcomings. He inherited a Pandora's box of personal and ideological woes from his predecessor, and they were aggravated by the release of patriotic pressures that accompanied the end of World War II.

When a weary, wrangling but overwhelmingly Democratic congress refused to enact social welfare and labour legislation based on Roosevelt's philosophy, Truman was characterized as "weak." The prospective beneficiaries of these measures—labour, racial groups, liberals, reformers of all kinds—deserted him and the party because of his rebuffs on Capitol Hill.

Three Roosevelt cabinet members—Harold L. Ickes, Henry A. Wallace and Henry Morgenthau—resigned or were forced out under embarrassing circumstances, and their places were filled with more conservative men. The exiles immediately began to criticize the president on the ground that he had forsworn Rooseveltian ideals.

Although President Truman vetoed the Case bill, which imposed drastic curbs on labour, a threatened railroad strike led him to ask for legislation drafting into the armed forces any man who struck against an industry which had been taken over by the government. The proposal failed of passage, but union labour leaders retaliated bitterly.

Even kindly Philip Murray, C.I.O. president, denounced the chief executive as an "enemy of labour." A. F. Whitney, railroad trainmen's head, vowed to spend every cent in his treasury to defeat Truman if he sought re-election. A.F. of L. and U.M.W. spokesmen assailed the White House. It was the first major break between a Democratic administration and organized labour in 13 years.

Russia also seized this unhappy moment to break wartime agreements, and to oppress European peoples whose kindred in the United States possess millions of votes. Blaming Washington for not making a more effective protest against Moscow's policies in Poland, Germany, Austria and the Balkans, these racial blocs fell away overnight.

The continuing scarcity of commodities 15 months after V-J day, especially meats, angered consumers, middlemen, distributors and retailers. A telling campaign cry was: "Hoover promised us two chickens in every pot, but it took Truman to put them there!"

Postelection analyses demonstrated almost mathematically that it was these urban blocs—labour, racial, consumers—who turned against the Democrats in vast numbers. The party lost or barely edged out a majority vote in the great centres which Roosevelt had always swept with majorities ranging from 300,000 to 700,000—Boston, New York, Philadelphia, Pittsburgh, Chicago, Cleveland and St. Louis.

Such machines as Frank Hague's in New Jersey, Tammany's in New York, Joseph Guffey's in Pennsylvania, Edward J. Kelly's in Illinois and Thomas Pendergast's in Missouri were

shattered, at least temporarily.

The Democrats made a few changes in organizing their senate and house commands for the 80th congress. Senator Alben W. Barkley of Kentucky shifted from majority to minority leader, but Senator Lister Hill of Alabama refused to continue as whip. He was replaced by Senator Scott W. Lucas of Illinois. On the house side former Speaker Sam Rayburn of Texas moved down to become minority leader, and Representative John W. McCormack of Massachusetts was chosen as assistant minority leader.

De Nicola, Enrico: see NICOLA, ENRICO DE.

Denmark. A monarchy of north central Europe. Area, 16,575 sq.mi.; pop. (est. 1945) 4,024,000. Capital: Copenhagen (731,707). Other principal cities: Aarhus (107,393); Odense (92,436); Aalborg (60,880). Religion: Lutheran Christian. Ruler in 1946: King Christian X (*q.v.*); prime minister, Knud Kristensen.

History.—Despite its small area and population Denmark faced a whole series of territorial problems during 1946. First was the soviet occupation of the island of Bornholm in the Baltic sea. After months of anxious concern the soviet evacuated the island completely and unconditionally on April 5. Held by the Germans during World War II and heavily bombed by the U.S.S.R. in May 1945, the island received in 1946 about 100 wooden houses from Sweden and normal life was gradually resumed. The Faroe Islands had been held by Britain during World War II. A plebiscite on Sept. 14, 1946, voted 5,650 to 5,500 for independence, but in the elections for the *lagting* (parliament) the pro-Danes won 12 seats to 8 for the independence group. Hence, negotiations were begun to work out a system of local autonomy under continued Danish rule. Complete independence of Iceland was accepted as a fact, but there too a new treaty relationship had to be established. As to Greenland the Danes were not entirely happy over the special privileges still exercised by the U.S., and Foreign Minister Gustav Rasmussen was in Washington, D.C., in December, reportedly discussing renunciation of the agreement of 1941 between Secretary Cordell Hull and Minister Henrik de Kauffmann.

Most serious of all the territorial problems was the question of Slesvig, a perennial thorn of Danish-German politics. North Slesvig had been returned to Denmark as the result of a plebiscite after World War I. The question of 1946 was what to do with south Slesvig (or Schleswig in the German spelling). In the province many people of both German and Danish blood wished to join Denmark or to set up a special administration under some form of international trusteeship. The problem was complicated by the movement of many German refugees into the area and by the fact that the nearby Kiel canal was a waterway of international importance—the most direct route between the Baltic and the North seas. The Danish government was extremely reluctant to take any steps which might increase its responsibilities and difficulties vis-à-vis Germany and other great powers.

Somewhat associated with the problem of Slesvig was that of more than 200,000 German refugees in Denmark itself. The schooling of 40,000 children and the feeding of all those people was costing Denmark 200,000,000 kr. per year, 40% of the prewar budget. Late in the year arrangements were made to repatriate 39,000 (12,000 each to the British and French zones and 15,000 to the soviet zone). Rasmussen wanted the U.S. to arrange for some in its zone and as rapidly as possible to unload the remainder.

Denmark's food problem was peculiar and ironic. Food there was in plenty, and the Danes did not go hungry. Yet there was talk of rationing meat and of reducing the rations of sugar and butter. This was because of the need of selling everything possible and saving foreign currency. Fear of rejection of a \$50,000,000 loan asked of the International Bank for Reconstruction and Development accentuated the difficulties. The Danes suffered from a trade agreement with Great Britain in which they pledged to send Britain the bulk of their butter production; soon the government subsidy to Danish farmers exceeded the price of the butter obtained from the English. In July the Danes got a 10% price increase, but were again in a losing position by fall and in December asked for a further price increase. Tea, coffee and chocolate were as short as new cars—all because of the Danish lack of foreign exchange.

Money was not the cause of the coal shortage, however. European sources were not producing in sufficient quantity and the Danes imported coal from the United States until first the shipping strike and then the coal strike in the United States cut that supply to a trickle. In Aug. 1946 Denmark got 32% of its coal from the United States; its stoppage threatened severe damage to industrial production.

Denmark was the 50th state to join the United Nations; in April 1946 it became the 38th state to join the International bank and the 39th member of the Monetary fund.

Education.—In 1940 there were 407,355 students in the elementary schools and 67,064 in the middle and secondary schools. In the 2 Danish universities 6,474 students were enrolled. Even during World War II about one-third of Denmark's famous folk high schools continued to function.

Finance.—The Danish crown (krone) was worth 20.877 U.S. cents in Sept. 1946. Some of the significant financial statistics:

	1945-46	estimates 1946-47
Ordinary account: receipts	1,304,200,000 kr.	1,230,500,000 kr.
expenditures	1,551,500,000 kr.	1,570,400,000 kr.
Capital account: receipts	12,729,700,000 kr.	1,481,500,000 kr.
expenditures	12,729,700,000 kr.	1,481,500,000 kr.

The domestic debt amounted to 3,830,500,000 kr., the foreign debt 611,900,000 kr., making a total public debt of 4,442,400,000 kr.

	1945	1946
Notes in circulation	1,561,000,000 kr.	1,487,000,000 kr. (end of Aug.)
Gold reserve	83,000,000 kr.	83,000,000 kr. (end of Aug.)
Commercial bank deposits	5,906,000,000 kr.	5,985,000,000 kr. (end of July)

Trade and Communications.—The strange distortion of Denmark's foreign trade because of World War II is shown by the statistics for 1944:

	Imports from	Exports to
Germany	908,050,000 kr.	1,090,141,000 kr.
Finland	85,748,000 kr.	64,882,000 kr.
Sweden	37,511,000 kr.	62,465,000 kr.
Norway	57,155,000 kr.	67,503,000 kr.
Irish Free State	27,977,000 kr.
Switzerland	1,166,801,000 kr.
Total imports	1,666,801,000 kr.
Total exports	1,360,467,000 kr.

The chief imports were fuel and petroleum (281,000,000 kr.), paper, etc. (97,000,000 kr.), iron and steel (70,000,000 kr.), wood and wood products (68,000,000 kr.). Chief exports were meat and meat products (364,000,000 kr.), dairy products (295,000,000 kr.), fishery products (138,000,000 kr.), live animals for slaughter (104,000,000 kr.), raw materials and partially manufactured articles (121,000,000 kr.).

Failure to achieve trade recovery in 1946 meant that Denmark had to plan to reduce imports in 1947 by 600,000,000-800,000,000 kr. Losses in export trade forced cancellation of many orders in Britain and required a drive for new export markets.

Denmark had 1,630,000 mi. of telephone wires (1946) and 371,000 instruments (1945); 904,610 radio sets (1945); 30,290 motor vehicles (1944); 4,860 km. of railway lines (1944) of

NATIVES OF BORNHOLM, Baltic island owned by Denmark, read of the departure of Russian troops in 1946. The island had been occupied by Russian soldiers from May 1945

which almost exactly half was privately owned and half state owned.

Agriculture.—Production of the chief agricultural products in short tons:

	1944	1945 (preliminary figures)
Bread grains	758,000	636,000
Feed grains	3,329,000	3,220,000
Potatoes	1,553,000	1,731,000
Sugar beets	1,400,000
Milk	4,420,000	4,519,000
Butter	141,000	146,000
Beef and veal	143,000	127,000
Pork	237,000	293,000
Eggs	51,000	55,000

The livestock census showed for 1944: 612,224 horses, 3-185,823 cattle, 1,555,176 milk cows, 2,032,623 pigs.

Manufactures.—Industrial production in 1944, from 6,717 establishments and 195,097 workers, totalled a value of 4,791,711,000 kr. (F. D. S.)

Dental Association, American: see AMERICAN DENTAL ASSOCIATION.

Dentistry. On Oct. 16, 1946, the 100th anniversary of the first successful public demonstration of ether anaesthesia, which took place in the amphitheatre of the Massachusetts General hospital, was celebrated in various medical and dental centres throughout the United States. William T. G. Morton, who gave the demonstration, was a dentist. The William T. G. Morton Centennial committee of the American Dental association presented to the trustees of the Massachusetts General hospital a bronze bas-relief of Morton to hang in the surgical suite of the hospital.

One of the public's greatest phobias, as far as dentistry is concerned, is the dental engine. This instrument used to grind out decay in a tooth and prepare it properly for a filling may

be the source of considerable pain which dentists have been eager to prevent. Injection of novocain and the use of nitrous oxide have been used quite widely. In an article by Leon Lieber, "Thermal Control Apparatus for Dental Drilling" (*J. Amer. Dental Assn.* Sept. 1946), a means of reducing pain to a minimum was outlined. The opening sentence of the article is interesting. "Seldom, *except in dentistry*, are revolving or cutting instruments generally used without a fluid lubricant." The author describes an apparatus which provides a stream of water at approximately body temperature delivered to the tooth at the point of drilling. The advantages are stated to be a marked reduction in pain (50% of patients feel none), the avoiding of over-heating of tooth which may cause pain later and a marked reduction in the time of grinding with a shorter tension period for the patient. The vibration which many patients find disagreeable, even when no pain is felt, is cushioned by the water.

Another procedure of a similar type described by a Boston dentist, Lester Cohn, and others (*Year Book of Dentistry*, 1945), who used a stream of air instead of water, received favourable attention.

The effect of the use of tobacco on the tissues of the mouth is a problem which the dentist faces constantly. In a paper on leukoplakia in its relation to the use of tobacco (*J. Amer. Med. Assn.* Nov. 2, 1946) the author, Clyde L. Cummer, called attention to the fact that practically all reported instances of papular leukoplakia have been in men almost all of whom have been smokers, especially pipe smokers. The condition has been cleared up in some cases merely by abstaining from smoking. Dentists have a great responsibility in these cases for frequently they are the first to see the lesion.

Penicillin continued to be effective in dental infections. A new development in penicillin therapy for dental infections was the injection of this product directly into the site of trouble. The prompt relief from pain and frequently the rapid recession of swelling without the development of the usual abscess approaches the miraculous. In a paper on "Penicillin in the Treatment of Dental Infections," Leroy M. S. Miner reported more than 100 cases of active infection with practically 100% successes. Very few forms of treatment in any field are as effective.

The dental aspects of federal legislation to bring about socialized medicine and compulsory health insurance were discussed actively. The American Dental association sent several of its officers to Washington to point out the fallacies in such legislation.

In a recent comment on dentistry under British health insurance it was pointed out by the president of the British Dental association that two dangers were apparent—one, that the attempt to expand the flow of service over greater areas of population would produce a serious sacrifice in quality of service and, second, red tape and the enslavement of the human personality by a machine of its own construction leads to stagnation.

Dermatology. Excellent results were reported in the treatment of lupus vulgaris by oral administration of calciferol (vitamin D₂). The drug was first given in doses of 150,000 international units daily and in some cases caused toxic symptoms, such as nausea, vomiting, diarrhoea and headache. Such symptoms disappeared when the dosage was reduced to 100,000 or even 50,000 units daily. Results of this treatment in 38 cases were reported by G. B. Dowling and E. W. Prosser Thomas at a meeting of the dermatologic section of the Royal Society of Medicine and occupied the entire session. In the majority of the cases the disease had regressed remarkably and in some cases had completely disappeared. Many of these cases had been previously treated locally by the Finsen or Kromayer lamps or by chemical caustics. Most of the older cases showed scars of X-ray treatment. Calciferol is prepared artificially by irradiation of a vegetable sterol, ergosterol. It constitutes a much simpler, less expensive and time-consuming method than irradiation with Finsen lamps.

As a result of war, there is an invariable increase in the prevalence of pediculosis and scabies. World War II was no exception and new methods were developed for the control of these infestations. Astonishing success in the treatment of pediculosis (both body and pubic lice) was noted by the development of an insecticide commonly known as DDT. This drug, in 10% talcum powder, was dusted onto the skin and through the clothes. It not only quickly cured a distressing disease but prevented the subsequent spread of typhus fever. Although the drug had been synthesized shortly before the war by Swiss chemists, the proper mixture and technique of using it was developed by P.M. Annand and his associates in the U.S. bureau of entomology and quarantine.

Scabies was unfortunately not eliminated during World War II but became the most common disease of the skin in the U.S. army, at least in the European theatre. The method of treating the disease by sulphur ointment was slow and required hospitalization. To lessen this loss of manpower, the British and U.S. armies eventually used a solution of benzyl benzoate by means of a spray. The results were considered satisfactory.

During World War II researches were made to discover an antidote for arsenical intoxication, since it was realized that the arsenical war gas, lewisite, might be employed by the enemy. A suitable antidote was developed by British scientists (2,3-dithiopropanol), which was popularly named BAL (British-anti-lewisite). No damage to the skin resulted from application of BAL as an ointment before exposure to arsenical vesicants, and when the vesicant was applied first, damage to the skin ceased after the application of BAL within two hours. In discussing its value W. T. Longcope stated that many experiments showed that BAL could not only stop the toxic action of arsenic, but was able to extract arsenic from cells even after injury to the skin was apparent. The most promising future for this new drug was in arsenical intoxication as seen in the treatment of syphilis. It apparently was of decided value in arsenical dermatitis and especially in toxic encephalopathy, a serious and otherwise often fatal disease. It apparently had slight, if any, effect on arsenical jaundice. Its possible benefit in intoxication resulting from other heavy metals was for the future to decide.

The value of podophylin in the treatment of acuminate warts was not generally known until 1942, from the work of Isaac Kaplan and his associates. Fifty patients were treated by M. Sullivan and L. S. King with a 25% suspension in mineral oil. All except two patients were cured and these had lesions of the dry type similar to common warts. These investigators then tried the remedy in 100 cases of common warts and obtained only 15% of good results. They found that the use of mineral oil as a vehicle tended to spread upon the normal mucosa and

cause irritation. They then treated another 50 patients with 20% podophylin in alcohol and obtained cures in all and with less irritation than when mineral oil was used.

Twenty cases of the discoid type of lupus erythematosus were treated by A. B. Hyman with oxyphenarsine hydrochloride. The average duration of the disease was nine years and in many cases had not yielded to other forms of treatment. The results were considered excellent in six cases, good in eight and unsatisfactory in six cases. Treatment was not given when albuminuria was present, when the leucocyte count was below 4,000 per cubic millimetre, when the Wassermann reaction of the blood was positive or the general health was unsatisfactory. Intravenous injections were given weekly, beginning with 5 mg. and increasing 5 mg. each week to a maximum of 30 mg. When no definite improvement was observed after giving a total of 1,200 mg., the treatment was stopped. It had to be discontinued in only one case of toxic manifestations.

Since it had been shown that injections of spleen and liver extracts in animals seemed to have a beneficial action on the metabolism of cancerous tissue, it was decided by J. C. Amersbach, E. M. Walter and G. S. Sperti to test the effect of such treatment on human epitheliomas. Twenty-one patients with basal cell epithelioma were treated by injections of spleen or liver extract. In one patient treated by spleen extract, the lesion failed to regress. In 14 patients the lesions regressed completely. The remaining six patients were still under treatment, but all had shown regression. In none of the cases observed since completion of treatment had there been any evidence of recurrence during a period of one or two years.

Tyrothricin, one of the newest antibiotic drugs, was effective primarily against gram-positive bacteria with which it had to come in direct contact to be effective. Tyrothricin was used for local applications only, either in the form of an ointment or a solution. Both were stable and did not require refrigeration. This new drug was used with success in some superficial pyogenic diseases of the skin. A. G. Franks, W. L. Dobes and J. Jones found it effective in impetigo contagiosa, pyoderma and dermatitis repens, but only of limited value in sycosis vulgaris and nummular eczema. H. E. Anderson treated 20 patients with cutaneous infections by continuous wet dressings of tyrothricin. His results were good in 75% of the cases, fair in 10% and poor in 15%. The purulent infection cleared with remarkable rapidity in most of the dermatologic diseases because of gram-positive organisms. An extensive trial was made by G. M. MacKee, M. B. Sulzberger, F. Hermann and F. L. Karp of a stable 0.1% solution of tyrothricin in a vehicle capable of enhancing penetration into the skin. The solution was applied to various skin diseases either by inunction with a glass rod or by wet compresses or both. There was a favourable response in 232 skin diseases caused or complicated by pyogenic infections. Most of the diseases treated were those involving the hair follicles. Favourable results were obtained in all of 112 cases of acne vulgaris.

In discussing the management of bacterial infections of the skin D. M. Pillsbury said that the usefulness of topical penicillin therapy was seriously jeopardized by an increased incidence of contact sensitivity which was being encountered. The incidence was apparently more than 15% and might be increased as more persons were exposed to the drug. An editorial note in the *Quarterly Review of Dermatology* mentioned the inadvisability of the indiscriminate use of penicillin, which could cause contact dermatitis and the production of penicillin resistance in the bacterial flora of patients.

In a study of keratosis blennorrhagica, E. Ladany and J. D. Hughes found a total of 166 reports of cases in the literature. In discussing the conflicting opinions about the cause of this

severe disease the authors stated that the preponderance of evidence points definitely to a gonorrhoeal origin in the vast majority of cases. The most logical explanation of the nature of the disease was that, while a bacteremia of short duration develops, the protracted and serious course is because of an extreme degree of bacterial allergy to the gonococci and their endotoxins. In the classic case they reported that 5,000,000 Oxford units of penicillin were used without any beneficial result. A totally different result was obtained by R. Emmet in another classic case of keratosis blennorrhagica by intramuscular injections of penicillin (total of only 200,000 units). All symptoms disappeared within two weeks, including fever, swelling of the joints and cutaneous lesions. (See also MEDICINE.)

Destroyers: see NAVIES OF THE WORLD.

Detroit. Fourth largest city of the United States in the 1940 census, Detroit is the centre of the large industrial area of southeastern Michigan. Area, 137.9 sq.mi.; pop. (1940) 1,623,452 of whom 320,664 were foreign born whites, British and Canadian ranking first with 110,698, and Polish second with 52,235. Pop. est. (June, 1946), 1,750,000.

Assessed value as of June 30, 1946, \$3,000,517,242 and an average blanket increase of 10% was announced for 1947; gross bonded debt, \$299,501,000; net bonded debt, including utility debt, \$273,858,123; net tax supported debt, \$216,030,157; gross city appropriations, fiscal year ending June 30, 1947, \$220,547,716 including schools and utilities; tax levy, city and school purposes, \$97.018,725; combined city and school tax rate \$32.334, the highest to that time. Late in 1946 the voters adopted a constitutional amendment sponsored by Detroit officials and designed to greatly increase state aid to local units of government (est. \$111,000,000 for Detroit) and alleviate the heavy tax on real property. Mayor, Jan. 1, 1947; Edward J. Jeffries, Jr., serving a fourth two-year term.

Although employment reached an all-time high during 1946, industrial production was much interrupted by work stoppages and by shortages of automobile parts obtained from suppliers. Ford and Chrysler avoided major strikes by the grant of pay raises early in the year based on the steel formula. In the spring the so-called "economic blockade" by the C.I.O.—U.A.W. against General Motors ended by acceptance of similar terms, concluding a strike of 113 days. The company successfully repudiated the proposal that wages be based on individual corporation profits rather than on a relationship to those paid by the industry as a whole.

As a whole, the well-being of citizens was more immediately disturbed by strikes that affected the necessities and conveniences of living, notably by milk handlers, bakers, film distributors and finally the employees of the municipally owned street railways. This last resulted in an increase in fare to a flat ten cents (without transfer charge) which increase turned an operating deficit into a reported surplus. Grocers resisted the organization efforts of the teamsters union with the result that at the close of the year a grand jury was investigating "labour racketeering" in a number of activities.

Incident to metropolitan Detroit labour difficulties, the

supreme court affirmed and amplified the "portal to portal" decision of a Detroit federal judge. At the end of the year a total of nearly 100 suits for an amount of more than \$600,000,000 of back pay and penalties had been filed against Detroit industries.

Grand jury investigations that resulted eventually in sending a mayor, sheriff, prosecuting attorney and several councilmen to the penitentiary, spread to the state government, and several members of the legislature and others were convicted of bribery. In the political area, the Republican party, after a long interval, elected a majority of local representatives to the state legislature and a number of candidates to county offices. However, a vacancy in the city council was filled by a labour candidate, although on earlier election, labour candidates were generally defeated. (L. D. U.)

Diabetes.

The 25th anniversary of the discovery of insulin by Sir Frederick Grant Banting and Charles H. Best was celebrated in October at Toronto, Canada, jointly by the University of Toronto and the American Diabetes association. There was a large attendance which included representatives from many countries. The papers presented form a part of the *Proceedings* of the American Diabetes association, whose secretary is Dr. Cecil Striker of Cincinnati, O.

The growth of public interest in diabetes during 1946 was manifested in several ways. Thus the U.S. public health service entered the field of diabetes and initiated a program for a detailed study of the frequency of diabetes among the blind in conjunction with the Commission of the Blind in Massachusetts and began a survey of the incidence of diabetes by examinations of the urine and blood of the 5,000 inhabitants of the town of Oxford in the same state. Hitherto, only one insurance company made a practice of insuring diabetics, but 1946 witnessed many insurance companies writing policies for diabetics. In general, the expectancy of life of a diabetic, based upon a tabulation in 1938 of many thousands of diabetics seen in private practice, was two-thirds that of the ordinary individual. Finally both the English and the American Diabetic associations expanded their activities by making more provision for the care of diabetics, increasing their membership and co-operating with their respective governments which had recognized their active force in diabetic health programs.

For each three years from the discovery of insulin in 1921 and its use with human patients in 1922 the average duration of life of diabetics, based upon fatal cases, increased 1 year or a total of 8 yr. for the period, making it 14 yr. in 1946. Between 1914 and 1922 it was 6.1 yr., calculated by deaths at that time, but when the data were recalculated to include all fatalities of those living in that period, but subsequently dying, the figure rose to 12.1 yr. This was one of the four reasons why diabetics were so much more numerous in the United States in 1946 than in 1921, the others being the prolongation of the lives of the inhabitants into the sixth decade, when diabetes occurs most frequently, better case finding and the increase of the population from 106,000,000 to 140,000,000.

Mortality tables failed to indicate the true picture of diabetes, because so often they represented only a fraction of those dying with diabetes but not of it. Surveys in Norway and in different areas of the United States have shown that approximately one-third of the diabetic population escaped enumeration. This became understandable when comparisons were made between the causes of death of diabetics formerly and now. Diabetic coma was recognized as diabetes and a diabetic death, but it dropped in 25 yr. from 42% to 3% of the deaths with no such distinctively diabetic complication to replace it, whereas cancer, which always hid a diabetic death, rose from 3.8% to 8.9%. Mor-

tality from diabetes in 1920 in the United States was 16.0 per 100,000, 14,062 deaths, but in 1944, it was 26.4 per 100,000, 34,948 deaths. The morbidity of the disease in this same country for 1946 was placed at 1,000,000, but this awaited statistical confirmation by surveys such as the one in progress in Oxford, Mass.

A detailed study of the diabetic mortality and morbidity in Bergen, Norway, with a population approximating 100,000, showed the morbidity was 3.8 per 1,000, 3.2 per 1,000 having applied for supplementary rations on account of their disease, while 0.6 per 1,000 had not done so because their disease was so slight. The Oslo Supply board placed the diabetic morbidity for Oslo in 1943 at 4.8 per 1,000.

The gravity of arteriosclerotic complications in the eyes, hearts and kidneys of all diabetics, but especially after the existence of the disease for 20 or more years in those with onset in childhood, has been generally recognized. The picture in this youthful group has been painted too dark, because the treatment of childhood diabetes in the 1920s was far inferior to that of today, both as regards diet and insulin. In the latest compilation of the causes of death of diabetics in the Joslin series, cardio-renal-vascular disease accounted for 67.4% of all diabetic deaths instead of 24.6 as in the years 1914-22 and the average age at death rose from 46.7 to 64.5 yr.

A new method for the production of experimental diabetes was announced by Francis D. W. Lukens and F. Curtis Dohan of the Cox Metabolic institute associated with the medical school of the University of Pennsylvania in Philadelphia. They found that as a result of the experimental production of hyperglycaemia by injections of glucose into the abdomens of cats, diabetes was established with changes in the islands of Langerhans similar to those resulting from injections of pituitary extract. (The article was accepted for publication in *Science*.) These experimental data thus strongly supported the orthodox treatment of diabetes.

Studies upon the diabetes experimentally produced by the administration of alloxan continued and, in fact, many new articles upon this subject appeared. The fact that destruction of the islands of Langerhans follows the intravenous administration of alloxan led to its use in a few cases of hypoglycaemia when the offending adenoma of the pancreas baffled removal. Partial successes were reported in a very few cases, but all concerned with this type of treatment warned of its dangers. Unfortunately the beta cells of tumours of the islands of Langerhans are more resistant to alloxan than the nonadenomatous island tissue.

Experiments with alloxan, by which the beta cells of the islands of Langerhans are destroyed and diabetes produced, were continued. Owls and chickens, however, appear immune. R. M. Archibald described six methods for the detection of alloxan but it had not been conclusively shown to be present in human tissues. A. Lazarow demonstrated that the intravenous injection of large doses of glutathione (2,500 mg./kg.) or of cysteine (912 mg./kg.) immediately before the injection of alloxan protected the rat from its diabetogenic action. So, too, will certain other chemicals. An injection of adrenalin, 0.1 cc. of a 1:1,000 solution, intraperitoneally also prevented the diabetogenic effect of alloxan in rats. Starvation of rats for 48 to 60 hr. made rats more susceptible to alloxan than nonfasting animals. The transmission of the effect of alloxan by the blood stream and its quick destruction or removal from the blood was shown when a part of the pancreas was deprived of blood by temporary ligatures around the supporting blood vessels for the first six minutes after alloxan was injected. The islets in that part of the pancreas temporarily deprived of blood were not damaged in contradistinction to the remaining islets in the pan-

creas which underwent degeneration. Instead of the customary intravenous or intraperitoneal methods of producing diabetes with alloxan, the same end was accomplished in cats by feeding 0.5 to 1 gm./kg. of alloxan mixed with the food. Alloxan injected into pregnant rats passed through the placenta into the foetal circulation within one to two minutes, but diabetes was not produced in the foetus, although the mother rat developed the disease.

Hydropic degeneration was observed 48–58 days after the administration of alloxan by one group of observers and by another after 194 days. These changes were attributed by the authors to the effect of hyperglycaemia on the beta cells which had escaped destruction by the original dose of alloxan. Thyroidectomy decreased and the induction of hyperthyroidism increased the sensitiveness of the rat to the toxic and diabetogenic action of alloxan. In addition to the destruction of beta cells in the islets of Langerhans, proliferative changes were observed 72 hr. after the injection of alloxan in the centro-acinar cells and in the intracanalicular ducts. These destructive and proliferative changes were followed by duct hyperplasia which gave rise to duct islets. Stimulation of the beta cells brought about their exhaustion followed by necrosis, the alpha cells remaining immune and the question was raised, "Were the alpha cells an intermediary stage in the evolution of beta cells, as maintained by some authors, or were they specialized cells with a specific function?"

Treatment with insulin continued as heretofore, the diabetes of the older patients being controlled with protamine zinc insulin and that of the younger ones with a combination of quick-acting insulin, regular or crystalline, plus protamine zinc insulin either by separate injections or in specially prepared mixtures before breakfast. Globin insulin has been employed especially with the intermediate group, its action being more rapid than the regular or crystalline and lasting about 20 hr. in contrast to protamine zinc insulin which exerts some effect for 24 to 48 hr., the drawback of globin insulin being its liability to cause hypoglycaemic reactions in the midafternoon. Up to Jan. 1947 the manufacturers had not offered a stable mixture of crystalline and protamine zinc insulin. (See also PHYSIOLOGY.)

Diamonds. World War II probably brought a more complete upheaval to the diamond industry than to any other industry of its size. In the prewar years, in spite of a marked increase in demand for industrial stones, the gem stone was still predominant. The war quadrupled the demand for industrial diamonds, with the results that imports of industrial stones into the United States during 1941–45 exceeded

world output of all diamonds during those years. Although the dollar value of gem stones imported was considerably greater than that of the industrial stones, the weight of the industrials was several times greater, and their value as tools in war production gave them a clear predominance over gem stones. The fact that the demand for industrial stones exceeded production meant that the supply could be maintained only because for many years industrials had been produced in amounts in excess of demand, so that large stocks had been built up. It was understood in 1946 that the heavy war demand had just about wiped out those accumulated stocks, at least in some grades, and that in the future the supply would be limited to current output. That producers anticipated a future demand in excess of past rates of production was evidenced by increases in output from the Belgian Congo, the largest producer of industrial stones, and by the reopening of mines in South Africa which had been shut down largely because they yielded larger proportions of the industrial grades than other mines.

Production data were difficult to secure during the war years, and for many countries only estimates can be given. Table I presents the data as collected or estimated by S. H. Ball, in *Minerals Yearbook*.

Table I.—World Production of Diamonds, 1939–45

	1939	1940	1941	1942	1943	1944	1945
	(Thousands of carats)

*Estimated.

Cutting.—A considerable degree of revival of the Belgian cutting industry was indicated by the 1945 U.S. imports of 104,840 carats of cut diamonds from Belgium, as compared with 399,806 carats in 1939. Belgium formerly cut a large proportion of small stones, with a proportionately low valuation, but a better grade of stones was evidently being handled in 1945, as imports averaged \$139 per carat in value, against \$54 in 1939. Using the 1945 U.S. imports as a gauge of the status of the cutting industry in various countries, we find the order to be Palestine, Belgium, Cuba, South Africa, Brazil and Great Britain. However, arranged in the order of the average value

DIAMONDS in the Bank of Japan, photographed in 1946. These gems were said to be marked for war reparations

per carat of the stones supplied, the order is South Africa, Great Britain, Cuba, Brazil, Palestine and Belgium. The revival of cutting in the Netherlands, the second largest source of cut stones in 1939, had as yet made little progress. The growth of the cutting industry in the United States is indicated by the importation of 896,547 carats of rough stones in 1944 and 893,761 carats in 1945, as compared with 153,982 carats in 1939, while the imports of cut stones was 488,154 carats in 1939 and 377,243 carats in 1945.

United States Imports.—The United States has long been the largest buyer of gem diamonds. From 1933 the weight of industrial diamonds imported had exceeded that of gem stones, though of course the value was much lower. Import data are shown in Table II.

Table II.—U.S. Diamond Imports, 1939–45
(Thousands of carats)

	Rough	Cut	Industrial	Total
1939	153,982	488,154	3,570,111	4,212,247
1940	227,886	321,471	3,809,856	4,359,213
1941	215,026	229,582	6,882,750	7,327,358
1942	278,437	126,004	11,204,754	11,609,195
1943	751,674	193,701	12,173,918	13,119,293
1944	896,547	169,097	12,656,823	13,722,467
1945	893,761	377,243	10,792,186	12,063,190

The values of the 1945 imports were: rough, \$43,122,622; cut, \$64,185,406; industrial, \$12,858,145; total \$120,166,173. The average values per carat were: rough, \$48.25; cut, \$170.14; industrial, \$1.19. (G. A. Ro.)

Diatomite. The annual production of diatomite in the United States was not reported, but the total sales for 1942–44 were 524,872 short tons, as compared with 360,502 tons in 1939–41, and 1945 ran above the 1942–44 average. California and Oregon are the chief producers. The principal uses are as filter aid, insulation and filler. Filtration absorbed about one-half of the consumption, fillers one-fifth, and insulation one-eighth. (G. A. Ro.)

Dictatorships: see COMMUNISM; FASCISM; GERMANY; SPAIN; UNION OF SOVIET SOCIALIST REPUBLICS.

Dietetics. Civilian feeding programs received an impetus as a result of wartime rationing and feeding. War-time food planning demonstrated how the broad principles of nutrition could be applied to the nation's food supply program within the limitations set by dietary habits and social environment; and it also showed that control bodies such as the United Nations Food and Agriculture organization might develop responsibility for distribution of food internationally.

Another important phase of international planning was furthered on July 22, 1946, when representatives of 61 nations signed the constitution of a new World Health organization. The functions relating to food and nutrition as defined in Article 2 of the constitution were: (1) to promote, in co-operation with other specialized agencies where necessary, the improvement of nutrition, housing, sanitation, recreation, economic or working conditions and other aspects of environmental hygiene; (2) to promote maternal and child health and welfare; (3) to develop, establish and promote international standards with respect to food, biological, pharmaceutical and similar products. It was also stated that the assembly may "promote and conduct research in the field of health by the personnel of the Organization, by the establishment of its own institutions or by co-operation with official or nonofficial institutions of any Member with the consent of its government." W.H.O. thus had ample warrant to act effectively in the field of nutrition.

Still another sphere of international planning was furthered in 1946 by five countries of Central America and Panamá when an

agreement was signed to engage in a four-year study of food and nutrition. It was planned that a physician, biochemist, agronomist and a health educator would receive a year of special training in the United States with a view to the study of food consumption, production of proper food, investigation of nutritional deficiencies and education of the people in proper food habits.

This program was somewhat similar in function to the nutrition program initiated in the United States after congress made it possible for the public health service to expand its activities in the field of nutrition. In this connection a nutrition section was set up in the states relations division to give consultation service to the states and to develop nutrition demonstration projects for localities on invitation from a state. These nutrition teams were staffed by a medical officer, a nutritionist, a chemist, a public health nurse, a laboratory technician and a clerk. These nutrition teams conducted nutrition demonstration programs on school children and family units. Until 1946 routine laboratory procedures were confined to determinations of haemoglobin, haematocrit and total plasma protein. In Alachua county, Fla., almost the entire school population was examined by the rapid physical method. There were three positive findings: namely follicular conjunctivitis, skin folliculosis and gingivitis.

As a result of such studies the value of supplementary feeding of school children in the United States was sufficiently well demonstrated that public law 396 was passed which established a permanent school lunch program. The federal funds for food were to be used for reimbursing schools for local purchases and for direct purchases by the department of agriculture of foods in abundant supply. The responsibility for setting nutritional standards for the lunches rested with the U.S. department of agriculture. The aim was to provide each child eating at school with at least one-third of his daily nutritive needs. Plans were made for further research on school feeding so that nutritional standards as well as methods of food preparation and school lunch management in general might be improved. The new legislation placed great responsibility on local initiative and resources. The act required that funds from within the state must be provided for the first four years, or until the fiscal year 1950, on an equal basis with federal funds, and for the next five years, or until 1955 inclusive, on the basis of \$1.50 for every \$1 of federal funds and for any fiscal year thereafter, in the relationship of \$3 for every federal \$1. Since matching of funds would be state-wide, it would be possible for schools in more affluent communities to help carry the operating costs of those in poorer communities. Small schools under this system would receive the benefits of quantity buying and better lunches.

The efficacy of supplementary feeding of mothers and babies was well demonstrated in Great Britain. Maternal and infant mortality and neonatal and stillbirth rates reached the lowest levels ever recorded. Provision of conventional medical care was found to be of less importance as a factor in explaining these results than proper food. There also appeared to be a decrease in anaemia particularly in women and children. The use of high extraction flour, the increased consumption of vegetables and the special measures taken to protect the health of expectant mothers and others contributed to this improvement. Postwar aims in Great Britain included greatly increased education in food matters for school children, students, housewives, caterers and cooks; investigations into the development and use of new foods; the continuation of the National Milk and Welfare Food services which had become part, as allowances in kind, of the family allowance legislation; the continuation and expansion of the service of milk and meals at school; and the

planning of a new attempt to provide better nutrition to adolescent workers in factories and other places.

Hospital feeding practices were improved as a result of the lessons learned during World War II on emaciation and starvation. It was found that in the emaciation where there is insufficient caloric and food intake to maintain a normal metabolic level, the outstanding deficiency is calories; but the specific nutrient deficiencies, particularly protein, are responsible for much of the clinical symptomatology. Wasting phenomena, especially of the musculature, presented the end result of a negative nitrogen balance. Abrupt therapy on prisoners of war, started in an attempt to restore these patients quickly to normal, resulted in a breakdown of the compensatory mechanisms and death ensued frequently. Effective therapy had to be directed toward supplying the proteins and eventually restoring complete caloric and nutrient therapy. Intravenous alimentation was found to be not only unnecessary but very dangerous. In the prisoner of war camps milk and egg mixtures, dehydrated and powdered, were well tolerated by the majority for oral use. Actual statistics gathered from the medical units for recovered Allied military prisoners also showed the value of the bland diet regime. In controlled studies of conscientious objectors it was demonstrated that calories were of overwhelming importance. Within reasonable limits every increase in calories was associated with an increased rate of recovery. If the total caloric intake was low; *i.e.*, less than 2,500 calories per day, supplementary protein seemed desirable. However, with a good caloric intake extra proteins beyond those in the diet itself (about 100 gm. daily) did not appear useful. For rehabilitation of conscientious objectors 2,500–3,000 calories seemed about right in the first few weeks and 3,500–4,000 later. The importance of maintaining a positive nitrogen balance for good health and convalescence was demonstrated beyond question. Good wound healing, resistance to infection and complete convalescence was dependent on attaining a positive nitrogen balance.

On May 29, 1946, the New York Academy of Sciences sponsored a conference on folic acid at the American Museum of Natural History in New York city. At this time the chemical structures were announced and the synthesis of folic acid and certain derivatives described. The availability of pure substances and the previous indication that folic acid was related to haematopoietic activity led to successful therapeutic trials in many macrocytic anaemias, pernicious anaemia, sprue and related diseases. The folic acid content of foods was also reported during 1946. While the methods of assay were not entirely adequate, there was an indication that fresh, deep green, leafy vegetables and liver were very high in folic acid; green vegetables, cauliflower and kidney were high; beef, veal, breakfast cereals prepared from wheat were of medium content; while root vegetables, tomato, cucumber, light green leafy vegetables, banana, pork, ham, lamb, cheese, milk, rice and corn cereals were low. Losses were found to be large when vegetables were stored at room temperature. Storage at normal refrigerator temperatures was quite effective in maintaining the folic acid content. Storage in ice prevented losses for periods of two weeks or more. The data on instability during cooking placed folic acid in the same group as thiamine, biotin, pyridoxine, inositol and pantothenic acid, all of which are more easily destroyed than riboflavin, niacin or choline. (See also FOOD RESEARCH; VITAMINS.)

Disabled American Veterans.

An organization of veterans, commonly called the D.A.V., who served honourably in time of war in the armed forces of the United States and who became wounded, gassed, injured or disabled as a result of that service. A small group of World War I veterans, while taking vocational training in Cincinnati, O., early in 1920, founded this organization in an attempt to improve the methods then being inefficiently employed in the administration of the affairs of veterans in vocational schools, hospitals and the then existing complicated system of overlapping government bureaus.

There was steady growth in the importance and usefulness of the organization. In recognition of its policies and valuable services to disabled veterans, their dependents and the public, a charter was granted by congress in 1932, and was amended in 1942 to extend eligibility to those who served in World War II.

During 1946, there was substantial expansion of activities, made possible and necessary by a rapid increase in membership, largely because of hundreds of thousands of veterans becoming eligible by reason of service in World War II. To meet the urgent need for assistance in handling claims for authorized benefits to which these veterans were entitled, additional personnel was necessary to handle administrative and service duties. An extensive program was therefore developed for completing the training of more than 400 veterans in American university at Washington, D.C., to be followed by on-the-job training with experienced personnel, in order to have skilled representatives of Disabled American Veterans available in U.S. hospitals, offices of the Veterans' administration and D.A.V. offices, to assist those needing help with their rehabilitation problems.

Funds for maintaining the executive and service activities are derived from per capita tax from membership dues, from voluntary gifts and contributions and from other sources. Early in 1946, the organization acquired ownership of an established business which it conducted as a department and which yielded a substantial percentage of the total financial income. This consisted of the production and distribution of "Ident-O-Tags," or miniature automobile licence plates. The tags are worn on key rings; in the event the keys are lost, the finder may deposit them in any letterbox. They are then delivered to D.A.V. headquarters for identification, and subsequently returned to the owner without charge.

National headquarters are located at 1423 E. McMillan street, Cincinnati, O. National service offices are maintained at 1701 Eighteenth street, S.W., Washington, D.C. As of 1946, Vivian D. Corbly had served for 21 years as national adjutant and business manager in charge of executive functions at national headquarters. At the annual convention in Portland, Ore., on Sept. 6, 1946, Lloyd F. Oleson was elected national commander.

Membership at the close of the fiscal year, June 30, 1946, was 105,039 in about 1,200 local chapters throughout the United States and in foreign countries. Eligibility requirements are such as obviously limit the numerical strength of the organization, but in 1946 it nevertheless ranked third in size among all veterans' organizations in the United States.

Publications include a newspaper, *The D.A.V. Semi-Monthly*, sent to all members, also reports to congress, various pamphlets and leaflets occasionally distributed to acquaint potential mem-

bers and the public with the activities of the organization, and the annual convention proceedings.

The women's auxiliary is composed of wives, widows, mothers, sisters, daughters and granddaughters of D.A.V. members. Mrs. Cicero F. Hogan, Cincinnati, was national commander in 1946. Headquarters office was at Colorado Springs, Colo., where Mrs. Ann Weber served as national adjutant. (V. D. C.)

Disasters. During 1946 loss of life and property in accidents included the following:

Aviation

- Jan. 18 Cheshire, Conn. All 17 persons aboard commercial air liner were killed when plane crashed into ravine and burned.
- Jan. 31 Near Laramie, Wyo. Crash of commercial air liner into Elk mountain, 65 mi. north of here, killed all 21 persons aboard.
